are the outlines of the Zoroastrian creed, as it flourished up to the time of Alexander the Great, throughout ancient Irania, including Upper Thibet, Cabulistan, Sogdiana, Bactriana, Media, Persis, etc.; and it is curious to speculate on the consequences which might have followed Marathon and Salamis had the Persians been victorious. The religion of Ormuzd would have dethroned the Olympians, as it dethroned the gods of the Assyrians and Babylonians; and it would certainly have left its traces upon the whole civilized world unto this day in a much more direct and palpable shape than it now does. From the death of Alexander, however, it gradually lost ground, and rapidly declined under his successors, until, in the time of Alexander Severus, Ardshir "Arianos" (cf. Mirkhond ap. de Sacy, *Mémoires sur div. Aut. de la Perse*, etc., p. 59), the son of Babegan, called by the Greeks and Romans Artaxerxes or Artaxares, who claimed descent from the ancient royal lineage of Persia, took the field against Artabanus, and slew him (225), thus putting an end to the four hundred years' rule of the Parthians, and founded the Sassanide dynasty. This he effected in conjunction with the national Persians, who hated the "semi-Greek" dynasty of the Arsacidæ, their leaning to the foreign, and contempt for the Zend religion, and finally for their powerlessness against the spreading conquests of the Romans. The first act of the new king was the general and complete restoration of the partly lost, partly forgotten books of Zerdusht, which he effected, it is related, chiefly through the inspiration of a Magian sage, chosen out of 40,000 Magians. The sacred volumes were translated out of the original Zend into the vernacular, and disseminated among the people at large, and fire temples were reared throughout the length and the breadth of the land.

The magi or priests were all-powerful, and their hatred was directed principally against the Greeks. "Far too long," wrote Ardshir, the king, to all the provinces of the Persian empire, "for more than five hundred years has the poison of Aristotle spread." The fanaticism of the priests often also found vent against Christians and Jews. The latter have left us some account of the tyranny and oppression to which they as unbelievers were exposed—such as the prohibition of fire and light in their houses on Persian fast-days, of the slaughter of animals, the baths of purification, and the burial of the dead according to the Jewish rites—prohibitions only to be bought off by heavy bribes. In return, the magi were cordially hated by the Jews, and remain branded in their writings by the title of demons of hell (*Kidushin*, 72 a.). To accept the instruction of a magian is pronounced by a Jewish sage to be an offense worthy of death (*Shabb.* 75 a.; 156 b.). This mutual animosity does not, however, appear to have long continued, since in subsequent times we frequently find Jewish sages (Samuel *the Arian*, etc.) on terms of friendship and confidence with the later Sassanide kings (cf. Moed Katan, 26 a., etc.). From the period of its re-establishment, the Zoroastrian religion flourished uninterruptedly for about 400 years, till, in 651 A.D., at the great battle of Nahavand (near Ecbatana), the Persian army, under Yezdezird, was routed by the caliph Omar. The subsequent fate of those that remained faithful to the creed of their fathers has been described, as we said before, under GUEBERS. At present some remnants inhabit Yezd and Kirmân, on the ancient soil of their race; others, who preferred emigration to the endless tribulations inflicted upon them by the conquering race, found a resting-place along the western coast of India, chiefly at Bombay, Surat, Nawsari, Achmedâbâd, and the vicinity, where they now live under English rule, and are recognized as one of the most respectable and thriving sections of the community, being for the most part merchants and landed proprietors. They bear, equally with their poorer brethren in Persia, with whom they nave of late renewed some slight intercourse for religious and other purposes—such as their Rivâyets or correspondences on important and obscure doctrinal points—the very highest character for honesty, industry, and peacefulness, while their benevolence, intelligence, and magnificence outvies that of most of their European fellow-subjects. Their general appearance is to a certain degree prepossessing, and many of their women are strikingly beautiful. In all civil matters they are subject to the laws of the country they inhabit; and its language is also theirs, except in the ritual of their religion, when the holy language of Zend is used by the priests, who, as a rule, have no more knowledge of it than the laity.

We have spoken of the leading fundamental doctrines as laid down by their prophet. Respecting the practical side of their religion, we cannot here enter into a detailed description of their very copious rituals, which have partly found their way into other creeds. Suffice it to mention the following few points. They do not eat anything cooked by a person of another religion; they also object to beef, pork, especially to ham. Marriages can only be contracted with persons of their own caste and creed. Polygamy, except after nine years of sterility and divorce, is forbidden. Fornication and adultery are punishable with death. Their dead are not buried, but exposed on an iron grating in the Dokhma, or tower of silence, to the fowls of the air, to the dew, and to the sun, until the flesh has disappeared, and the bleaching bones fall through into a pit beneath, from which they are afterwards removed to a subterranean cavern.

Ahuramazdao being the origin of light, his symbol is the sun, with the moon and the planets, and in default of them the fire, and the believer is enjoined to face a luminous object during his prayers. Hence, also, the temples and altars must forever be fed with the holy fire, brought down, according to tradition, from heaven, and the sullying of whose flame is punishable with death. The priests themselves approach it only with a

half-mask (Penom) over the face, lest their breath should defile it, and never touch it with their hands, but with holy instruments. The fires are of five kinds; but however great the awe felt by Parsees with respect to fire and light (they are the only eastern nation who abstain from smoking), yet they never consider these, as we said before, as anything but emblems of divinity. There are also five kinds of "sacrifice," which term, however, is rather to be understood in the sense of a sacred action. These are—the slaughtering of animals for public or private solemnities; prayer; the Daruns sacrament, which, with its consecrated bread and wine in honor of the primeval founder of the law, Hom or Heomoh (the Sanscr. *Soma*), and Dahman, the personified blessing, bears a striking outward resemblance to the sacrament of the Lord's supper; the sacrifice of expiation, consisting either in flagellation or in gifts to the priest; and, lastly, the sacrifice for the souls of the dead. The purification of physical and moral impurities is effected, in the first place, by cleansing with holy water (Nirang), earth, etc.; next, by prayers (of which sixteen, at least, are to be recited every day) and the recitation of the divine word; but other self-castigations, fasting, celibacy, etc., are considered hateful to the divinity. The ethical code may be summed up in the three words—purity of thought, of word, and of deed: a religion "that is for all, and not for any particular nation," as the Zoroastrians say. It need hardly be added that superstitions of all kinds have, in the course of the tribulations of ages, and the intimacy with neighboring countries, greatly defiled the original purity of this creed, and that its forms now vary much among the different communities of the present time.

Something like a very serious schism, however, has lately broken out in the Parsee communities, and the modern terms of conservative and liberal, or rather bigot and infidel, are almost as freely used with them as in Europe. The sum and substance of these innovations, stoutly advocated by one side, and as stoutly resisted by the other, is the desire to abolish the purification by the Nirang—a filthy substance in itself,—to reduce the large number of obligatory prayers, to stop early betrothal and marriage, to suppress the extravagance in funerals and weddings, to educate women, and to admit them into society. Two counter alliances or societies, the "Guides of the Worshipers of God" and "the True Guides" respectively, are trying to carry out at this moment, by means of meetings, speeches, tracts, etc., the objects of their different parties.

The literature of the Parsees will be found noticed under PERSIAN LANGUAGE AND LITERATURE, and AVESTA. Besides the latter, which is written in ancient Zend, and its Gujarati translation and commentaries, there are to be mentioned, as works specially treating of religious matters, the *Zardusht-Nameh*, or Legendary History of Zerdusht; the *Sadder*, or Summary of Parsee Doctrines; the *Dabistan*, or School of Manners; the *Desatir*, or Sacred Writings, etc. All these have been translated into English and other European languages.

On the influence Parseeism has had upon Judaism and its later doctrines and ceremonial, and, through it, upon Christianity and Mohammedanism—which besides drew from it directly—we cannot dwell here at any length. So much, however, may be stated, that the most cursory reading of the sacred Parsee books will show, in a variety of points, their direct influence upon the three Semitic creeds. Of works treating on the subject of this article, we mention principally, Hyde, *Vet. Rel. Pers. Hist.* (Oxon., 1760, 4to); Ousely, *Travels in the East* (Lond. 1819); Anquetil du Perron, *Exposition des Usages des Parses;* Rhode, *Diehel. Sage der alten Baktrier, Meder u. Perser*, etc. (Frank.-a-M., 1820, 8vo); Dosabhoy Framjee, *The Parsees*, etc. (Lond. 1858); Dadabhai Naoroji, *The Manners and Customs of the Parsees;* and *The Parsee Religion* (Liverpool, 1861, 8vo); and lastly, Haug's *Essays on the Parsee Religion* (Bombay, 1862), and Spiegel's *Erân* (Berl. 1863.)

PARS'LEY, *Petroselinum*, a genus of plants of the natural order of *umbelliferæ*. The species are annual or biennial, branching, smooth, herbaceous plants, with variously pinnated leaves.—COMMON PARSLEY (*P. sativum*), which has tripinnate shining leaves, one of our best known culinary plants, is a native of the south of Europe, growing chiefly on rocks and old walls, and naturalized in some parts of England. The cultivation of parsley is extremely simply, and an annual sowing is generally made, although when cut over and prevented from flowering, the plant lives for several years. A variety with curled leaflets is generally preferred to the common kind with plain leaflets, as finer and more beautiful, being often used as a garnish; it is also safer, as the poisonous fool's parsley (q.v.) is sometimes gathered by mistake instead of the other.—HAMBURG PARSLEY is a variety with a large white carrot-like root, cultivated for the sake of its root, and much in the same way as the carrot or parsnip. To produce large roots and of delicate flavor, a very rich soil is required. The foliage of parsley is not merely of use for flavoring soups, etc., but is nutritious, at the same time that it is stimulating, a quality which it seems to derive from an essential oil present in every part of the plant. Parsley contains also a peculiar gelatinous substance called *apiine*. The bruised leaves of parsley are sometimes employed as a stimulating poultice. The seeds are a deadly poison to many birds, and when powdered, they are sometimes used for killing lice.

PARSNIP, *Pastinaca*, a genus of plants of the natural order *umbelliferæ*, having compound umbels with neither general nor partial involucres; yellow flowers with roundish, involute, sharp-pointed petals; calyx almost without teeth; fruit dorsally compressed and

flat, with a broad border, the ridges very fine. The species are annual, biennial, or perennial herbaceous plants, with carrot-like, often fleshy roots, and pinnate leaves —The COMMON PARSNIP (*P. sativa*) is a native of England, although not of Scotland, and is abundant in some districts, particularly in chalky and gravelly soils. It is also found in many parts of Europe, and of the north of Asia. It is a biennial, with angular furrowed stem, 2 to 3 ft. high, pinnate leaves with ovate leaflets, rather shining, cut, and serrated, and a three-lobed terminal leaflet. The root of the wild plant is white, aromatic, mucilaginous, sweet, but with some acridness; and injurious effects have followed from its use. Cultivation has greatly modified the qualities both of the root and foliage, rendering them much more bland. The parsnip has long been cultivated for the sake of its root, which in cultivation has greatly increased in size, and become more fleshy. The flavor is disliked by some, as well as the too great sweetness, but highly relished by others; and the root of the parsnip is more nutritious than that of the carrot. The produce is also, on many soils, of larger quantity; and although the parsnip delights in a very open rich soil, it will succeed in clayey soils far too stiff for the carrot. It is rather remarkable that it has not been extensively cultivated as a field-crop, and for the feeding of cattle, except in the Channel islands and in limited districts of continental Europe; more particularly as cattle are very fond of it, and not only the flesh of cattle fed on it is of excellent quality, but the butter of dairy-cows fed on parsnips in winter is far superior to that produced by almost any other kind of winter-feeding. The mode of cultivation of the parsnip scarcely differs from that of the carrot. There are several varieties in cultivation. A very large variety, cultivated in the Channel islands on deep sandy soils, has roots sometimes 3 or 4 ft. long; but this is fully twice the ordinary length, and there is a smaller turnip-rooted variety sometimes cultivated in gardens where the soil is very shallow. The parsnip is used chiefly in winter, whether for the table or for feeding cattle. It is improved rather than injured by frost; but is apt to become *rusty* if allowed to remain too long in the ground; and exhibits acrid qualities after it has begun to grow again in spring. The root of the parsnip is much used in the north of Ireland for making a fermented liquor, with yeast and hops; and both in England and Ireland, for making *parsnip wine*, which has some resemblance to Malmsey wine.—Another species, the CUT-LEAVED PARSNIP or SEKAKUL (*P. sekakul*), having pinnatifid cut leaflets, a native of India, Syria, and Egypt, is cultivated in the Levant, and is very similar in its uses to the common parsnip.

PARSON, in English ecclesiastical law, means the incumbent of a benefice in a parish. He is called parson (Lat. *persona*) because he represents the church for several purposes. He requires to be a member of the established church of England, and to be duly admitted to holy orders, presented, instituted, and inducted; and requires to be 23 years of age. When he is inducted, and not before, he is said to be in full and complete possession of the incumbency. The distinction between a parson and a vicar is, that the parson has generally the whole right to the ecclesiastical dues in the parish, whereas the vicar has an appropriator over him, who is the real owner of the dues and tithes, and the vicar has only an inferior portion.

PARSONS, a city in Labette co., Kan., on Labette creek and the Missouri, Kansas, and Texas and the Kansas City, Fort Scott, and Memphis railroads. It has churches, schools, banks, and newspapers. The car and machine shops of the M. K. and T. railroad are here, and there are flour mills, elevators, foundry, etc. Pop. '90, 6,736.

PARSONS, ALBERT ROSS, American musician, was born at Sandusky, Ohio, Sept. 16, 1847; studied music with R. Denton, Buffalo, N. Y., 1853–57, with F. L. Ritter, New York city, 1863–7, with Moscheles, Reinecke, Papperitz and Richeter in Leipsic, 1867–69, and with Tausig, Weitzmann, Kullak, and Wuerst in Berlin, 1870–71; is the composer of the songs *Night has a Thousand Eyes; Break, Break*, and *Three Fishes*, which have been extensively sung in concert in America and Europe. Mr. Parsons is the originator of the "Synthetic method" for pianoforte; has translated Wagner's *Beethoven* and is the author of *Parsifal; New Light from the Great Pyramid*, a study in cosmic religion and prehistoric Christianity. He is president of the American College of Musicians of the university of the state of New York, and vice-president of the Metropolitan college of music.

PARSONS, JONATHAN, 1705–76; b. Mass.; graduated at Yale college, 1729; was ordained pastor of the Congregational church in Lyme, Conn., 1731, where he continued until 1745; settled at Newburyport, Mass., in 1746, where he died. He was distinguished for his learning, for his skill as a controvertist, and as a preacher. He published *Letters on the Christian Ministry; Letters on Baptism; Lectures on Justification; Good News from a Far Country, in Seven Discourses; A Sermon on the Death of G. Whitefield; Freedom from Civil and Ecclesiastical Tyranny the Purchase of Christ; Sixty Sermons on Various Subjects*, 2 vols.

PARSONS, SAMUEL HOLDEN, 1737–89, b. Conn., son of the Rev. Jonathan Parsons. After graduating at Harvard college, 1756, he studied law at Lyme, Conn., with gov. Matthew Griswold, his uncle; began practice in Lyme, 1759, and for many years represented the town in the colonial assembly. In 1774 he removed to New London, and was made prosecuting or king's attorney. At the outbreak of the revolution he took command of the 6th Connecticut regiment, was present at the battle of Long Island and the siege of Boston, and for his services was promoted to the rank of brig.gen.; in 1779 he became

Putnam's successor in the command of the state militia, and in 1780 was made a maj. gen. At the close of the war he opened a law office in Middletown, Conn. Congress in 1785 appointed him a commissioner to treat with the Miami Indians, and a few years later he negotiated the treaty between Connecticut and the Indian tribes about lake Erie, by which the claim of the latter, to what became known as the Connecticut western reserve, was extinguished. In 1787 he headed a New England colony which settled on the reserve near the Ohio river. He published a paper on the *Antiquities of the Western States* in vol. 2 of the *Transactions of the American Academy.*

PARSONS, Theophilus, ll.d., 1750–1813, b. Mass.; graduated at Harvard in 1769, and was admitted to the bar in 1774. He began the practice of his profession at Falmouth, now Portland, Maine, which was laid waste by a British squadron in Oct., 1775; and Parsons, whose prospects for professional success at Falmouth were ruined by this disaster, withdrew soon afterward to Byfield, his native town. There, for some years, he studied in the library of Judge Edmund Trowbridge, then the first jurist in New England, and whose collection of law books was at that time perhaps the most complete in this country. Parsons finally removed to Newburyport, where he soon acquired an extensive practice; and for some ten years he exerted a considerable influence in public affairs. In 1778 he was active in the discussion of the new constitution of Massachusetts, then recently framed by the legislature. Parsons was strongly opposed to the adoption of that instrument; he was a member of the "Essex Junto," which comprised a large number of the citizens of Essex co. hostile to the new constitution; and the pamphlet called *The Essex Result,* and which had a great influence in bringing about the defeat of the new constitution, is attributed to him. In 1779 he sat in the convention which drew up the constitution which, with some changes, still subsists in Massachusetts. In 1788 he was a member of the state convention called to act upon the adoption of the federal constitution. He warmly supported the latter, and the so-called "Proposition" in favor of its adoption, though offered by John Hancock, was drawn up by Parsons. Besides serving from time to time in the legislature, this was his last appearance in public life. He settled in Boston in 1800, and continued his law practice, which had long included causes from all parts of New England. From 1806 till his death he was chief justice of the state supreme court. His judicial opinions have not been as fully reported as could be desired, but those preserved in the early Massachusetts reports, and in his *Commentaries on the Law of the United States,* show great ability and learning, especially in the departments of real property and marine insurance. He was expeditious in the dispatch of business, and thoroughly conversant with the old common law system of pleadings. In politics he was a federalist in principle, but after his elevation to the bench, punctilious to take no share in them.

PARSONS, Theophilus, ll.d., b. Mass., 1797; son of Chief Justice Parsons. He graduated at Harvard in 1815, was admitted to the bar, and began to practice in Taunton. Soon afterward he removed to Boston, where he became the founder and editor of the *United States Literary Gazette.* He also contributed regularly to the *North American Review.* In 1847 he was appointed Dane professor of law at the law-school of Harvard university, where he remained for a quarter of a century. Dr. P. published a number of treatises on legal subjects. His *Law of Contracts,* which has become a standard work upon its subjects, and has gone through many editions, appeared in 1853, and was followed by *Elements of Mercantile Law,* 1856; *Laws of Business for Business Men,* 1857; *Maritime Law,* 1859; *Notes and Bills,* 1862; *Law of Partnership,* 1867; *Marine Insurance and General Average,* 1868; *Shipping and Admiralty,* 1869; and *Political, Personal, and Property Rights of a Citizen of the United States,* 1875. He was a Swedenborgian, and he produced a number of works maintaining the doctrines of the New Jerusalem church. The most important are his *Essays,* in 3 series; *Deus Homo,* 1867; and *The Infinite and the Finite,* 1872. He d. 1882.

PARSONS, Thomas William, b. Boston, 1819; educated at the Boston Latin school. He went to Italy in 1836, and carefully studied Italian literature, particularly the works of Dante, a translation of the first 10 cantos of whose *Inferno* he published in 1843. Returning to Boston, he took a medical degree at the Harvard medical school, and for some time practiced dentistry. For a number of years he lived in England, and afterward in Italy. He published in 1854 a collection of poems under the title of *Ghetto di Roma,* and a translation of the *Inferno* in 1867. His other works include *The Magnolia, The Old House at Sudbury, The Shadow of the Obelisk* (all poems), and *Circum Præcordia.* He occasionally contributed to the *Catholic World* and other periodicals. He d. in 1892.

PARSONS, Usher, 1788–1868; b. Maine; received an ordinary education, and studied medicine under Dr. John Warren, of Boston. In the war of 1812 he entered the naval service as surgeon's mate and was acting surgeon of Perry's flag-ship, the *Lawrence,* and in that capacity was present at the battle of lake Erie, Sept. 10, 1813. He remained in the navy until 1822, was present at the attack on Mackinac, and after resigning his commission practiced his profession at Providence, R. I. He became a professor in Brown university medical school, president of the state medical school, and first vice-president of the national medical association. He published a life of sir Wm. Pepperell,

1856, several medical works, and a number of biographical sketches and speeches connected with the events of the battle of lake Erie.

PARSONSTOWN (anciently called BIRR), a considerable inland t. on the river Brosna, in King's county, Ireland, 43 m. n.e. of Limerick, with which city it is connected by a branch line issuing from the Great Southern and Western railway at Ballybrophy. Pop. '91, 4,313; of whom the great majority were Roman Catholics. Birr had its origin at an early period in a monastery founded by St. Brendan, and was the scene of many important events, both in the Irish and in the post-invasion periods. The castle, which was anciently the seat of the O'Carrols, was granted by Henry II. to Philip de Worcester; but it frequently changed masters, and even alternated between English and Irish hands. By James I. it was granted to Lawrence Parsons, ancestor of the present proprietor, the earl of Rosse; but through the entire period of the civil wars, its possession was constantly disputed, until after 1690, when the Parsons family was finally established in possession. About this time Birr returned two members to parliament, but the privilege was temporary. The castle has been rebuilt. Parsonstown is one of the handsomest and best built inland towns in Ireland, with several fine churches and chapels, a nunnery, a statue of the duke of Cumberland, a bronze statue (erected in 1876) of the earl of Rosse, a town-hall, a library, literary institute, a model and other schools. But the great attractions of Parsonstown are the castle, the observatory containing a great telescope 52 feet long, and the laboratory of the late earl of Rosse (q.v.), still maintained in active use by the present earl. Parsonstown is an important corn-market, a considerable center of inland commerce; but with the exception of a distillery and brewery, it is almost entirely without manufactures. It is a military station, and the seat of a union workhouse.

PÂRS'WANÂTHA, the twenty-third of the deified saints of the Jainas, in the present era. He and *Mahavîra,* the twenty-fourth, are held in highest esteem, especially in Hindustan. In a suburb of Benares called Belupura, there is a temple honored as the birthplace of Pârswanâtha. See JAINAS.

PART, in music. When a piece of music consists of several series of sounds performed simultaneously, each series is called a part.

PARTANNA, a market t. of the island of Sicily, in the province of Trapani, 38 m. s.w. of Palermo. Pop. 13,144.

PARTERRE, in gardens laid out in the old French style, the open part in front of the house, in which flower-beds and closely-cut lawn were intermingled according to a regular plan.

PAR'THENOGEN'ESIS (from the Gr. *parthenos,* a virgin, and *genesis,* the act of production) is a term invented by Prof. Owen to indicate propagation by self-splitting or self-dividing, by budding from without or within, and by any mode save by the act of impregnation; the parthenogenetic individuals being sexless or virgin females. See the article GENERATIONS, ALTERNATION OF. For many remarkable facts in relation to parthenogenesis in insects, the reader is referred to Prof. Owen's 18th lecture, *On the Comparative Anatomy and Physiology of Invertebrate Animals;* and to Siebold, *On Parthenogenesis,* translated by Dallas.

This term, as employed by Prof. Owen and applied, as noticed in the preceding remarks, to the processes of gemmation and fission as exhibited in sexless beings or virgin females, is not strictly the generative process which is now indicated by its use. The term is now confined to the generation of new individuals from the development of *ova* by virgin females without contact with the male element. The peculiarity of this process is appreciated by regarding the proper definition of an ovum, and its distinction from an internal bud. An ovum is usually contained in an ovary, and always has a germinal vesicle and a germinal spot, and during its development undergoes what is known as segmentation of the yelk. Examples of true parthenogenesis are seen in certain plant-lice (*aphides*), the honey-bee, and some of the lower and smaller crustaceans, as now classified. In the autumn, plant-lice consist of males and females, which by sexual union produce ova; but these remain dormant during the winter. In the spring they are hatched, but, instead of producing males and females, the young are all of one kind, variously regarded as neuters, females, or hermaphrodites. These oviparous products, whatever their nature may be, now produce viviparously a *brood* of young resembling themselves, these in turn bringing forth a third generation; and the same viviparous process may be repeated a considerable number of times during the summer. The last generation, however, brought forth at the commencement of autumn will not be all of one kind, but will consist of distinct sexes. Now sexual reproduction by means of eggs takes place, as in the preceding autumn, to be followed in the spring by another series of viviparous generations. The viviparous multiplication of the aphides is multitudinous, and it has been estimated that ten generations of a single aphis during one summer may reach the number of one quintillion. The ovary of each viviparous aphis resembles that of a fertile female, with certain exceptions which cannot well be described here. It may be regarded as a pseudo-ovary, and it generates or develops eggs or "pseudo-ova," which, without male intervention, are developed into young aphides. There is no anatomical difference between the pseudo-ova and true ova, the

distinction being purely physiological. Some naturalists, however, maintain that the viviparous aphides are hermaphrodites, possessing both sexual elements, in which case their mode of generation would not be an example of parthenogenesis; but this view is not entertained by most observers. In regard to certain reproductive phenomena among honey-bees there seems to be but little doubt. There are three classes of individuals in a hive of bees; a *queen*, or fertile female; *workers*, forming the bulk of the community and which are examples of arrested development in females; and, thirdly, the *drones*, or male bees, produced at certain times of the year. The wonderful impregnation of the queen, which occurs during her "nuptial flight," results in the storing up of fecundating material in a receptacle which communicates by a tube with the oviducts, and which material, it is said, can be used at will, or at least is used periodically, as occasion requires. The ova which become undeveloped females, or workers, are fertilized during their passage through the oviduct; and the subsequent development of these fecundated ova into queens or into workers, as the case may require, depends upon the form (seemingly) of the cell which receives the ovum, and upon the food which is given to the larva. There is nothing in the evidence so far produced to show non-sexual generation; but careful observers have succeeded—by preventing, as they assert, the contents of the seminal receptacle of the queen from passing into the oviduct, and thus coming into contact with the ovum—in causing her to produce none but males, or drones. If these observers are correct, this case is one of parthenogenesis; and at present the prevailing tendency is toward the acceptance of their conclusions.

PAR'THENON, the temple of Minerva at Athens; one of the most celebrated of the Greek temples, and usually regarded as the most perfect specimen of Greek architecture. Many of the sculptures have been brought to England, and are now in the British museum. See GRECIAN ARCHITECTURE; ELGIN MARBLES.

PARTHENOPE'AN REPUBLIC (from *Parthenope*, the oldest name of the city of Naples) was the name given to the state into which the kingdom of Naples was transformed by the French Republicans, Jan. 23, 1799, and which only lasted till the following June, when the invading army was forced to retreat.

PAR'THIA, anciently a country of western Asia, lying at the s.e. end of the Caspian sea, from which it was separated by a narrow strip, known as Hyrcania, now forms the northern portion of the province of Khorassan, and is an almost wholly mountainous region. Its rivers are merely mountain torrents, which are supplied by the melting snow on the Elburz range during winter and spring, but are mostly dry in summer and autumn.

The original inhabitants are believed to have been of Scythian race, as shown by their language as well as by their manners, and to belong to the great Indo-Germanic family. If this be the case, as is very probable, the term Parthian, from its analogy to the Scythian word *parthe*, banished, seems to indicate that they were a tribe who had been driven to Parthia out of Scythia (i.e., central Asia). The Parthians during the time of the Roman republic, were distinguished by primitive simplicity of life and extreme bravery, though at the same time much given to bacchanalian and voluptuous pleasures. They neglected agriculture and commerce, devoting their whole time to predatory expeditions and warfare. They fought on horseback, and after a peculiar fashion. Being armed solely with bows and arrows, they were rendered defenseless after the first discharge; and, to gain time for adjusting a second arrow to the bow, turned their horses, and retired, as if in full flight, but an enemy incautiously pursuing, was immediately assailed by a second flight of arrows; a second pretended flight followed, and the conflict was thus carried on till the Parthians gained the victory, or exhausted their quivers. They generally discharged their arrows backward, holding the bow behind the shoulder; a mode of attack more dangerous to a pursuing enemy than to one in order of battle. The Parthians first appear in history as subject to the great Persian empire. After the death of Alexander the Great, Parthia formed part of the Syrian kingdom, but revolted under Antiochus II., and constituted itself into an independent kingdom under the *Arsacidæ* (see ARSACES), 250 B.C., a race of kings who exercised the most completely despotic authority ever known, treating their subjects as if the vilest of slaves; yet so accustomed did the Parthians become to this odious rule, that some of the later monarchs, who had received a Roman education, and after their accession treated their subjects with ordinary justice and humanity, were completely despised. The capital of the Parthian monarchy was Hecatompylos ("the city of the hundred gates"), now Damgan. The Parthian dominion rapidly extended to the Euphrates on the w. and the Indus on the e., and became a most powerful and flourishing empire; Seleucia, Ctesiphon—the capital of the Persian emperors of the Sassanidæ—and other celebrated cities date their rise from this period, and soon eclipsed, in size and splendor, the ancient Hecatompylos. In spite of repeated attacks on the part of the Romans, the Parthians maintained their independence (see CRASSUS, MARCUS); and though Trajan, in 115–116 A.D., seized certain portions of the country, the Romans were soon compelled to abandon them. In 214 A.D., during the reign of Artabanus IV., the last of the Arsacidæ, a revolt headed by Ardshir, son of Babegan, broke out in Persia, and the Parthian monarch, beaten in three engagements, lost his throne and life, while the victor substituted the Persian dynasty of the SASSANIDÆ (q.v.) for that of the Arsacidæ. Some scions of the Parthian royal

family continued for several centuries to rule over the mountainous district of Armenia, under the protection of the Romans, and made frequent descents upon Assyria and Babylonia; but their history is obscure and of little importance.

PARTIAL LOSS, in the law of marine insurance, is a loss which is not total; and therefore the insurer is not entitled to abandon or give up the remains of the ship or cargo, and claim the entire insurance money; but he is bound to keep his ship or goods, and claim only in proportion to his actual loss or damage.

PAR'TICIPLE (Lat. *participium*, part-taking), the name of a class of words which have the meaning of a verb with the form of an adjective. The name is said to have been given from their partaking of the nature both of a verb and of an adjective. Some grammarians make the participle a distinct part of speech, but it is more commonly classed as a part of the conjugation of the verb. There are in English two participles, one in *ing*, usually called the present, but properly the imperfect, because it expresses continued, unfinished action, e.g., *loving, writing;* and the other expressing past action, and ending either in *ed* (*t*) or in *en*, e.g., *loved, written*. In Ang. Sax. and old Eng., the imperfect participle ended in *and*, e.g., *haband* (having), corresponding to the modern Ger. *habend*, Gr. *echont* (os), Lat. *habent* (is). In the sentence, "he is *writing* a letter," *writing* is the imperfect participle; in "the *writing* of the letter occupies him," or "*writing* is a difficult art," it is a substantive, and had a different origin. In the latter case, *-ing* corresponds to the Ang. Sax. termination *-ung*, used in forming substantives from a large class of verbs; thus, Ang. Sax. *halgung* (hallowing) is equivalent in meaning and in etymology to Lat. *consecratio;* similarly, modern Ger. *Vernichtung*, annihilation, from *vernichten*, to annihilate. Such a phrase as, "while the letter is writing," seems to be a shortened form of the now antiquated, "is a-writing," which was originally, "is in writing." Although this mode of expression is liable in some cases to ambiguity, it is terser and more idiomatic than the circumlocution of, "is being written," which is often substituted for it. The verbal substantive in *-ing* is often exactly equivalent to the infinitive; thus, "*standing* long in one position is painful" = "*to stand*," etc. It has this advantage, that while it can be construed as a noun (e.g., with a possessive case), it can retain at the same time the usual adjuncts of a verb; as, "what are we to infer from the king's dismissing his minister?" The use of this form contributes not a little to the peculiar brevity and strength of the English language.

PARTICK, a t. of Scotland, in the co. of Lanark, prettily situated, chiefly on a rising ground on the Kelvin, immediately above its junction with the Clyde, and about 2 m. w.n.w. of the cross of Glasgow, of which city it now forms a suburb. Nine-tenths of the workmen of Partick are engaged in ship-building, and there are numerous ship-building yards, flour mills, cotton factories, and bleach-fields. A large proportion of the inhabitants are engaged in business in Glasgow, and for their accommodation extensive ranges of handsome villas have been built here. Pop. '51, 3,132; '61, 8,183; '81, 27,410; '91, 36,538.

PARTINICO, SALA DI, a post-town of Sicily, in the province of Palermo, and 14 m. s.s.w. of the city of that name, at the foot of a grand precipice of red limestone. The plain in the vicinity is of surpassing fertility; corn, wine, oil, fruit, and sumach are produced in rich abundance: and linen and woolen goods are manufactured. Pop. abt. 21,000. Scattered vestiges of ancient habitations are still to be seen on the summit of the height above the town, and are said to be the ruins of the ancient *Parthenicum* mentioned in the *Itinerary* of Antoninus, and there only.

PARTISAN is a name for a halberd or pike, or for a marshal's baton. The name is also given to the leader of a detached body of light troops, who make war by harassing the enemy, rather than coming to direct fighting, by cutting off stragglers, interrupting his supplies, and confusing him by rapid strategy. The action of such a corps is known as *partisan warfare.*

PARTITION, a thin interior wall dividing one apartment from another. It is usually of brick-work, 4½ or 9 in. thick, or of timber with standards about 4½ in. thick, covered with lath and plaster. Wooden partitions are used when there is no sufficient support for brick. When these have to carry joists or any other weight they ought to be constructed in the form of a truss (q.v.).

PARTITION, the division by co-parceners, joint tenants, or tenants in common, of their undivided interests in lands, tenements, or hereditaments, or in goods and chattels. Technically the term is restricted to the severance of common interests in real estate, by the persons above named. Estates in co-parcenery were created by operation of law, when one estate fell to two heirs: thus, where the tenant of an estate in fee died without male heirs, his estate devolved upon his daughters or female representatives, who took as co-parceners. A dissolution of such a joint-estate would be compulsory at the common law, upon request of a single co-parcener, because the creation of the joint-estate was compulsory. But estates in joint-tenancy and tenancy in common were created by voluntary act of the parties and could be dissolved only in the same way. The common-law rule was finally changed by statute, so that since the reign of William IV. all estates in common have been subject to partition. Joint-tenancy has been generally abolished in the United States, so that tenancy in common is practically the only

form of joint-ownership found in this country. But heirs and devisees holding the estate of a deceased ancestor, in common, have still to resort to partition. Partition is either compulsory, i.e., without reference to the consent of one or more of the owners; or voluntary, i.e., by consent of all the owners. The former is effected by the suing out of a writ of partition at common law, by the party demanding partition, or by bringing a partition in a court of equity. A voluntary partition is secured by a mutual release by all the other owners to every owner of the share which is to vest in him. It is always more advantageous, and is now more common to seek partition in a court of equity. A law court can make a severance only in accordance to the proportionate interests of the parties; and such a division is often injurious to the interests of some of the parties. A court of equity does not confine itself to the allotment of equal shares, but makes an equitable division, giving each party the portion which seems best adapted for his interests, and if necessary making one party an equitable compensation for improvements made in the common property. Where a petitioner's title is disputed, equity will not interfere, and he must establish it at law. "Partition in law and at equity," says lord Redesdale, "are very different things. The first operates by the judgment of a court of law and delivering up possession in pursuance of it, which concludes all the parties to it. Partition in equity proceeds upon conveyances to be executed by the parties, and if the parties be not competent to execute the conveyance, the partition cannot be effectually had." A written agreement for a partition as held by equity is equivalent to a partition, and will be enforced. A parol partition has been held void, notwithstanding an actual possession in severalty; but it has been held that where a tenant in common has had actual adverse possession for a number of years, partition will be inferred. A parol partition will be held good notwithstanding the statute of frauds, if there have been a several possession for some time, and the line of partition is certain. A partition of real estate by quit-claim deed is valid between the grantee of a tenant in common and his co-tenants. As a rule, a person must have actual seisin to maintain proceedings for partition, but a tenant in common need have only a right of entry. No partition can be had of land to which the parties have only a title in remainder, or where the title is vested in a third person, as a trustee. A tenant in common of personal property cannot maintain a bill for partition, while another has adverse possession. The owner of an undivided interest cannot claim partition of part of the land held in common, but if division be made, the whole must be divided. When proceedings for partition are brought, every person not a plaintiff having an interest in the land, must be made a plaintiff. In many states special proceedings for partition have been established by statute, and particular courts, frequently courts of probate, are given jurisdiction over partition. The limit of the interest of the several parties is first fixed by a hearing, and thereupon the court appoints commissioners to make the severance and allotment, their acts being subject to the revision of the court. If no equitable division of the land can be made, it is to be sold at public auction, and the proceeds divided among the owners according to the order of the court, which will protect the rights of all parties in its decree.

PARTITION, or PARTITURA, in music. See SCORE.

PARTITION LINES, in heraldry, lines dividing the shield in directions corresponding to the ordinaries. According to the direction of the partition lines, a shield is said to be party or parted per fess, per pale, per bend, per cheveron, per saltire; a shield divided by lines in the direction of a cross, is said to be quartered; and a shield parted at once per cross and per saltire, is said to Gironné (q.v.) of eight. The partition lines are not always plain; they may be engrailed, invected, embattled, wavy, nebuly, indented, dancetté or raguly—forms which will be found explained under separate articles.

PARTNERSHIP, in the law of England, is the union of two or more individuals acting under a contract, whereby they mutually contribute their property or labor for the purpose of making profits jointly. When a partnership is confined to a particular transaction or speculation, it is usually called a joint-adventure, and the parties are joint-adventurers. The usual criterion by which a partnership is ascertained to exist, as distinguished from other arrangements, is that there is a community of profit; it is not essential that both should suffer losses equally or proportionably, for one partner may stipulate that he shall not be liable to loss. This stipulation is binding between the partners, but of course is insufficient to prevent the partners from being all liable to third parties. So one partner may contribute all the capital or all the labor. A dormant partner is one whose name does not generally appear to the world as a partner, but who nevertheless is to all intents and purposes a partner, with equal rights and liabilties to the rest. In order to constitute that kind of community of profit which is the chief ingredient in a partnership, it is necessary that the partner share in the profits as a partner; for in many cases, clerks, servants, or agents receive a commission or remuneration proportioned to profits, and yet are not partners, for this is merely one mode of ascertaining the salary which they are to receive. In all such cases, therefore, the distinction as to whether there is a partnership or not turns on the consideration whether the alleged partner receives a share of the profits, as such, or merely receives a salary proportioned to profits, without having a specific interest in the firm. The contract of partnership may be entered into either by word of mouth or in writing. If no specified

term be agreed upon, it is a partnership at will, and may be dissolved by either of the parties at pleasure. Sometimes, also, the court of chancery will interfere to dissolve the partnership before the time appointed; but this only happens when some unforeseen and urgent reason exists, as that one of the partners has become a lunatic, or has proved grossly dishonest, or the object of the partnership cannot be carried out. Mere differences of opinion on minor matters are no ground for seeking a dissolution. The partners may make any kind of arrangement between themselves that they think proper; but if these are unusual and special stipulations, there is no certainty of securing the same being adhered to, without a formal deed or indenture of partnership being executed. Thus, it is common to stipulate as to the capital each is to contribute, and as to the proportion of profits he is to receive, as what is to be done in case of the death of a partner, etc. Unless a stipulation is made to the contrary, the rule is, that the death of one of the partners dissolves the partnership. So does his bankruptcy. It is also a rule that no new partner can be introduced without the consent of the rest. There was once a peculiarity in the law of England as to the form of remedy—the rule being, that partners cannot sue each other in a court of law in respect of partnership transactions, but the only remedy is by a bill in chancery. As against third parties, whatever may be the secret arrangements between themselves, the rule is, that any partner can bind the firm in all matters which are within the scope of the partnership, each being by the nature of the contract made the agent of all the rest for business purposes. Thus, any one may accept a bill in the name of the firm, provided such be one of the modes of doing business. It is, however, to be borne in mind, that the firm is only bound by one of the partners in those matters which are strictly within the proper business of the firm, which is an important qualification of the general power. Within the above limits, each partner can bind the rest of his co-partners, however imprudent or foolish may be his act, for it is one of the implied conditions, that all have full confidence in each other. It follows from this principle, that the firm is liable for the dealings of each partner on its behalf within the scope of the partnership, and each is liable to the full extent for all the debts of the firm; in short, each is liable to his last shilling for the solvency of the firm. Hence, it is often of importance for a partner, on leaving the firm, to know how to terminate this liability. The rule is, that as regards all strangers, a notice in the *Gazette* is good notice; but as between the firm and those who have had dealings with it, the *Gazette* notice is of no use, unless it can be proved that the party had actual notice given to him—and hence a circular-notice sent to customers announcing the fact of retirement, is the only course effectual.

The practice of individuals entering into large associations, now called joint-stock companies, which were originally only extended partnerships, has led to a separate code as to these being framed for the United Kingdom. See JOINT-STOCK COMPANIES. The practice of limiting the liabilities of partners or shareholders in joint-stock companies had of late years led to the belief that a similar restriction might well be extended to ordinary partnerships, and accordingly a bill was introduced into parliament in 1864 to enable this to be done. But that view was not carried out except to a limited extent, though an attempt was made to simplify some of the rules as to partnership liability, which are somewhat perplexing. It had long been matter of complaint that every man who had a share of the profits of a trade was said to be liable also to bear his share of the loss; whereas by lending money at a fixed rate of interest he was a mere creditor and could be exposed to no risk but the loss of his advance. The house of lords, however, in 1860, had held it to be a mistake to suppose that a person who advanced money on terms of sharing profits was necessarily a partner. To remove part of the difficulty, however, an act of 28 and 29 Vict. c. 86 was passed, which enacts that if advances are made by written contract to a person in trade on terms of sharing profits, that of itself will not make the lender a partner. Nor will the payment of a servant or agent by a share of profits, nor the receipt by a deceased partner's widow or child of part of the profits as annuity, make any of these a partner. But the benefit of this act was confined in most cases to written contracts, and thus the old law remains as to other cases. It is still the law that a person, not a partner, becomes liable as one, if he has either represented himself as a partner, or authorized another so to represent him; and the third person dealing with the firm must have known this representation to enable him to hold the dormant partner liable. In 1870 a bill was passed "to facilitate compromises and arrangements between creditors and shareholders of joint-stock and other companies in liquidation," but these points do not call for notice here.

In Scotland the law of partnership, though in its essential features the same with the law of England, differs in one or two particulars. The partnership is treated as a distinct person in law, the partners being only its sureties or cautioners; and the consequence of this is, that in actions by or against the firm, the individual partners need not be named, though in practice one or two of them generally are named. Each partner may also sue the firm as if it were a distinct person; and the firm may be made bankrupt without any of the partners being sequestrated. See Paterson's *Comp of E. & S. Law*, p. 214,

Partnership in American law, is defined by Kent as "a contract of two or more competent persons, to place their money, effects, labor, and skill, or some or all of them in

lawful commerce or business, and to divide the profit and bear the loss in certain proportions." *What constitutes a partnership:* There must be an agreement to carry on some business for the purpose of profit, and that the parties to the agreement shall share the profit. The association of a number of persons for the purpose of carrying on business for the sake of profit may not be a partnership, but a corporation differs from a partnership in this, that though composed of a number of persons, it performs its acts as a whole; and its rights and liabilities are as those of a single person, and not as those of the persons of whom the corporation consists. The rights and liabilities of a partnership, on the other hand, are those of the individual partners. A partnership differs, on the other hand, from a joint tenancy, or tenancy in common. A common interest in the profits is absolutely essential to constitute a partnership. An agreement for a community of profits is *primâ facie* an agreement for a partnership. An agreement to share profits is *primâ facie* an agreement to share losses, though the agreement says nothing of losses; and wherever a community of profits is shown, the existence of a partnership is not necessarily negatived even by a positive stipulation against community of loss. Parties not actually partners are made liable as such, by law in two cases. The first case, resulting from the principle of estoppel, is where non-partners have acted in such a way as to make other persons suppose they actually are partners. The second case of partnership as to third persons arises from sharing profits. An instance of this is where a person in the service of others, receives not a salary, but a share in the profits. Both these partnerships as to third persons are known as *quasi* partnerships. Every person who has a share in the profits of the business, is *primâ facie* a partner as to third persons; and if he have never represented himself as a partner, he may show that he is not a partner as to the others. The question as to what kind of community in the profits will charge a person as a partner in respect to third persons has given rise to many subtle distinctions. There is a series of cases in which it is held that the right to demand an account of profits is the test whether a person be or be not a partner. But it appears from the 5 Gray, 58 (Mass.), and elsewhere, that though every partner has a right to demand an account, every person who has a right to demand account is not necessarily a partner. Another series of cases hold that only a party who has a specific interest in the profits as principal trader, is chargeable as a partner. Other cases again hold that a participation in the *net* profits charges a man as partner, but not a participation in the gross profits. The cases are not uniform upon this point. At present, however, whether there be a partnership or not, depends upon the intention of the parties. Each partner is regarded both as principal and agent in relation to the other partners.

Essentials of the formation of a partnership: 1. The association must be voluntary. 2. The purpose must be some lawful business. 3. The persons must be competent to contract. By common law any number of persons might form a partnership, but some English statutes restrict the number. 4. There must be a contribution of capital or skill. Good credit may be equivalent to capital. 5. The parties must be to each other as principal and agent. 6. The result aimed at must be mutual profit, and generally there is some agreement as to the distribution of profits. In a case where there was no special agreement, lord Eldon thought there should be an equal division, but the opinion of lord Ellenborough on the same case at *nisi prius* seems better, i.e., that it was a question for the jury what is a reasonable share. A partnership may be either *actual or ostensible.* If actual partnership exist, though not ostensible, as in the case of dormant partners, the liability to third persons exists. So if a person be an ostensible, though not an actual partner, he is liable.

Classes of partnership: 1. General.. 2. Special. 3. Limited as to liability. This exists only by statute. 4. Joint stock companies. No one can become a member of the firm without the consent of *all* the parties. But one partner may sub-divide his share without the consent of the others. The parties may stipulate to admit certain parties in future, e.g., the representatives of a partner in case of his death during the partnership. A court of equity will not ordinarily enforce an agreement of partnership; it will leave to the party this remedy at law for breach of the contract. Whether a partnership exist or not, is a question of fact, in determining which the sharing of the profits is merely evidence, but no fact makes a partnership by operation of law as formerly. Co-partners are thus distinguished from co-owners: a co-owner owns only part of property absolutely; co-partners have an interest in the whole. An agreement to buy property together does not constitute a partnership, but an agreement to buy and sell does. Written proof is required by the statute of frauds in a partnership in real estate. A firm may assume any name, and even different names at the same time; but if any man's name be used with his knowledge, or if he otherwise hold himself out as a partner, he is liable to those who directly or indirectly learn the fact, and act on it. But his liability does not apply to his executors or administrators. A firm cannot use the name of another the same as its own if such use be liable to deceive. But no generic name, or name of country, or product, can be the subject of private property. According to the modern law, partnerships may be formed for any business that an individual may pursue. But a distinction is taken between the right to carry on a business forbidden by law, and the right of partners to recover the proceeds of such business from each other The act of partners often occurs in one country while the firm is in another; the

legality of the action is determined by the law of the country where the act is performed. The powers of a partnership are usually expressed in articles, and the powers of the majority are limited by the articles, or by the main purpose of the partnership. In dealing with third persons, each partner has all the power of the firm. Each partner is the unlimited agent of the others in every matter connected with the partnership business, or which he represents to be partnership business, and which is not by its nature outside of such business. But in legal proceedings a partner cannot confess judgment for his co-partner; the whole firm must confess. He cannot submit a controversy of the firm to referees without consent of the other partners, although the firm's attorney can submit the firm's case to referees. A partner cannot execute a sealed instrument for the firm; but where a seal is unnecessary by law, or in settlement of debt or release, he may execute such an instrument. But an authority on the part of the other partners to execute a sealed instrument will be readily implied by the court. A partner may appoint agents and fix their compensation. He cannot charge, however, for his own services. Unanimity of partners may change any condition in the partnership business, even its nature. Each partner has a lien on partnership property for payment of partnership debts, and of his proportion. As a consequence all real estate is treated as personal property. Creditors may disregard partner's lien and pursue other remedies. Partners may convert partnership property into private property, and so discharge it from lien. In the United States in the absence of agreement to the contrary, partners are held entitled to equal shares in the profits. No allowance is to be made for an excess of capital paid in, or charge for excess withdrawn. Apart from the action of account, there is no action at law pending the partnership in regard to partnership affairs. A partnership may be dissolved by the act of God, as the death of one of the partners; by mutual consent of the parties; by an assignment of the partnership property for the benefit of creditors; by the assignment of a partner's interest to his co-partner or another; by act of the law, as the bankruptcy of a partner; by the marriage of a female partner; by the lapse of the time for which the partnership was formed; by the completion of the business for which the partnership was formed; by war between the different states in which the partners live, and by the award of arbitrators appointed under the articles of partnership. Lunacy of one of the partners does not itself dissolve the firm, but upon clear evidence of incurable insanity a court of equity will decree a dissolution. A partnership may be dissolved by decree in cases of gross carelessness or willful fraud, or where there are permanent dissensions between the parties of such a nature as to prevent their carrying on the business. Dissolution ends all transactions between the parties except for taking an account and winding up the business. The power of the partners still continues for some purposes; as to pay the partnership debts out of the partnership funds, to carry out the engagements of the partnership, and to convert all the partnership assets for the benefit of the partners. The liability of partners as to third persons continues till actual notice of the dissolution is served upon the latter, if they have had previous dealings with the firm; for other persons, notice in the newspapers is sufficient. Notice of the retirement of a dormant partner need be given to only such creditors as know of his being a partner. The class of partnerships known as "limited" is allowed by statute in most of the American states. They consist of one or more partners, called general partners, whose liability is unrestricted, and one or more special partners with a liability restricted to the amount of capital furnished by each.

PARTON, James, b. England, 1822; went to New York while young, and received his education at an academy in White Plains, N. Y.; where about 1841 he began to teach. He followed this profession for some years, teaching also in New York city and Philadelphia, and then entered upon a literary career, by joining the staff of the New York *Home Journal*, with which paper he continued three years. In 1855 he published his *Life of Horace Greeley;* and in 1857 his *Life of Aaron Burr.* The latter work established for him a reputation as a brilliant writer of biography, and became very popular. It was followed in 1859–60 by his *Life of Andrew Jackson*, a more ambitious work, and which tended to confirm the popular impression with regard to him. He published also *Humorous Poetry of the English Language from Chaucer to Saxe; Biography of Franklin; General Butler in New Orleans; Famous Americans; Caricature and the Comic Art;* and a number of pungent monographs on political and other topics. He contributed frequently to the *North American Review*, *Atlantic Monthly*, and other periodicals; and also was a successful lecturer. He married, in 1856, Sara Payson Willis, sister of Nathaniel P. Willis, better known as "Fanny Fern;" and after her death, in 1872, married her daughter by her first marriage. He d. in 1891.

PARTON, Sara Payson (Willis), 1811–72; b. Maine; received her education in the school of Catharine and Harriet Beecher, in Hartford, Conn; and, in 1834, married Charles Eldridge, of Boston. Her husband died in 1846, leaving her with two children; and she married a Mr. Farrington, a Boston merchant, but the union proved short-lived. She now endeavored to support her children and herself by teaching, but was unsuccessful, and in 1851 made her first attempt in literature by sending sketches signed "Fanny Fern," to Robert Bonner, the publisher of the *New York Ledger.* These sketches were written in a vein and upon topics which secured public attention, and were widely

copied; and the immediate result was a lucrative engagement with Mr. Bonner, for whom she continued to write until her death. In 1853 she published a collection of her articles, under the title *Fern Leaves*, which had a large circulation, as many as 70,000 copies being sold. She also published *Ruth Hall, Rose Clark, Fresh Leaves*, and other novels and sketches. Soon after beginning to write for the *Ledger* she removed to New York, where she passed the remainder of her life. She married James Parton in 1856.

PART-OWNERS, in law, are persons who, without being partners, hold undivided shares of personal property. Their respective rights and interests differ greatly from those of partners; one cannot bind the others as their agent; but if there be such agency and authority to act for the other part-owners, it must be created in some other way; nor can it exist, nor its existence be inferred, from the fact of part-ownership. A part-owner can affect only his own undivided share of the property; he cannot place an incumbrance on the whole, or assign or dispose of the whole. The term part-ownership is ordinarily and almost exclusively applied to ownership in vessels. It is common for a vessel to be held by a number of persons, not as partners, but as part-owners. The vessel, in that case, is supposed to be divided into a number of equal shares. The various part-owners manage the vessel by, and delegate their interests to, a number of agents, of whom the principal are the ship's husband and the master. These officers have a wide authority under the maritime law to bind their principals in certain contracts. Thus the master can make contracts for supplies, uses, and repairs, when the ship is abroad; and if necessary may borrow money on the credit of the part-owners, or procure it by bottomry, or by a pledge of the cargo. As long as he acts within the scope of his authority the part-owners will be liable; and the ship itself is liable as a rule. The ship's husband is generally himself a part-owner. He is the agent of the owners to make repairs, and generally attends to the equipment and management of the ship. A majority of the part-owners have the right to use the ship for a particular voyage, against the will of the minority; but they must secure the latter, to the amount of their shares, against loss.

PARTRIDGE, *Perdix*, a genus of gallinaceous birds, of the family *tetraonidæ*, having a short, strong bill, naked at the base; the upper mandible convex, bent down at the tips; the wings and tail short, the tarsi as well as the toes naked, the tarsi not spurred. —The Common Partridge, or Gray Partridge (*P. cinerea*), is the most plentiful of all the game-birds in Britain, and becomes increasingly plentiful as cultivation is extended, whilst the range of the moorfowl is restricted. It is not found in the outer Hebrides. On the continent of Europe it is abundant in almost all districts suitable to its habits, from Scandinavia to the Mediterranean, and is found also in the n. of Africa, and in some parts of the w. of Asia. It varies considerably in size; those found in rich lowlands being generally the largest, and about 12½ in. in entire length; while those which inhabit poorer and more upland districts are rather smaller. The female is rather smaller than the male. The upper parts of both are ash-gray, finely varied with brown and black; the male has a deep chestnut crescent-shaped spot on the breast, which is almost or altogether wanting in the female. A variety called the mountain partridge has the plumage brown. The partridge is seldom found far from cultivated land. It feeds on grain and other seeds, insects and their larvæ and pupæ, and the pupæ of ants are generally the food sought at first for the young. The nest is usually on the ground, among brushwood and long grass, or in fields of clover or corn, and generally contains from 12 to 20 eggs. The young run as soon as they are hatched. Both parents show a very strong attachment to their young, and great courage in repelling assailants; they have also recourse, like many other birds, to stratagem, to draw off the most powerful and dangerous enemies, such as dogs, in another direction, fluttering close before them as if broken-winged, whilst the brood escape. Until the end of autumn, the parent birds and their brood keep together in a *covey;* late in the season, several coveys often unite into a *pack*, when it becomes much more difficult for the sportsman to approach them. The flight of the partridge is strong and rapid for a short distance, but it does not seem to be capable of a long-sustained flight. The eggs of partridges are often hatched, and the young birds reared, by the domestic hen, the chief requisite being a plentiful supply of ants when the birds are very young. Partridges thus reared become very tame, but they seldom breed in the aviary.—The Red-legged Partridge (*P. rufus*, or *caccabis rufus*, the genus or subgenus *caccabis* being distinguished by a rudimentary blunt spur on the tarsi) is a native of the s. of Europe and of the Channel islands, and is now also plentiful in some parts of England, particularly Norfolk and Suffolk, into which it has been introduced. It is rather larger than the common partridge, stronger on the wing, and less easily approached by the sportsman, whilst it is also less esteemed for the table. The upper parts are of a reddish-ash color; the throat and cheeks white, bounded by a collar of black, which expands in black spots on the breast; and the sides exhibit bars of black. The plumage is smooth.—Two other species, nearly allied to this, are found in some of the southern parts of Europe. India has a number of species. The habits of all the species much resemble those of the common partridge.—The name partridge is sometimes extended so as to include the species of *ortyx* (see Virginian Quail), and in South America is sometimes given to the tinamous.

PARTRIDGE, Alden, 1785–1854; b. Norwich, Vt.; graduated from the U. S. military academy, 1806, Dartmouth college, 1812, and was appointed 1st lieut. of engineers;

capt. in 1810. In 1813 he was appointed professor of mathematics at West Point, having been assistant professor for a year previous, and in September following became professor of engineering; afterward superintendent of West Point academy till 1818, when he resigned. In 1819 he went out as leader of the surveying party sent to the n.w. frontier of the United States to determine the boundary line. He was the founder of a military school at Norwich, Vt., in 1820, subsequently attached to Norwich university, of which he was made president. In 1822 he was appointed surveyor-gen. of Vermont, and was several times a member of the legislature. He gave lectures on military topics in the leading cities of the country, and established schools for military instruction in Portsmouth, Va., 1840; in Reading, Penn., 1850; and in Delaware and New Hampshire. In 1822 he published *An Excursion;* in 1827 *Letters on Education*, and on *National Defense; Journal of a Tour of Cadets*, etc.

PARTRIDGE, George, 1740–1828; b. Duxbury, Mass.; graduate of Harvard, 1762; studied divinity, and taught school at Kingston. In 1774–75 he was a delegate to the provincial congress. He was representative from his state 1775–79, a delegate to the continental congress 1779–82, and 1783–85; in 1780 and for several years sheriff of Plymouth county. At his death he left a large share of his estate for the advancement of religion and popular education.

PARTRIDGE BERRY, or Checker Berry, a genus of rubiaceæ (madder family), represented by one species in America, and one in Japan. The American species, *Mitchella repens*, named in honor of Dr. John Mitchell, a correspondent of Linnæus, and an excellent botanist of Virginia, extends from Canada to Mexico and South America. It is a small trailing evergreen, having a branching stem, a foot long, often more, usually covering the ground with a mat. Its favorite habitats are dry, sandy knolls in piney woods, but it may be found in most dry woods. Its leaves are smooth and shining, round-ovate, opposite with short petioles, and traversed with light lines; flowers in pairs with ovaries united; calyx four-toothed; corolla funnel-form, four-lobed; the lobes spreading densely bearded inside; white, tinged with rose or purple: fragrant; stamens four, style one; stigmas four, linear. Fruit, a beautiful scarlet berry crowned with the calyx teeth of the two flowers, each with four small seed-like and bony nutlets. The berry is about the size of that of the winter-green, but broader, and short; also varies, some of them being four times as large as others. They remain on the plant during the winter. Blossoms in June and July. The berries are often eaten, but are pitchy and rather tasteless, much inferior to the winter-green berry, which is also often erroneously called partridge berry.

PARTRIDGE BERRY. See Gaultheria.

PARTRIDGE PIGEON (*Geophaps*), an Australian genus of *columbidæ*, approaching more than most of the pigeons, in character and habits, to the true gallinaceous birds, and particularly to partridges. Their plumage is beautiful, and generally with a bronze tinge and lustre on the wings, which causes them to be sometimes called bronze-wings. There are several species. They live mostly on the ground, and rise with a whirring noise, like the pheasant when disturbed. They are highly esteemed for the table.—*Geotrygon montana*, a species of another genus of *columbidæ*, bears the name of Partridge Dove in the West Indies. It also seeks its food chiefly on the ground, although it affects well-wooded districts.

PARTRIDGES, in artillery, were very large bombards formerly in use at sieges and in defensive works. They are mentioned in Froissart.

PARTRIDGE-WOOD, a very pretty hard wood from the West Indies and Brazil; it is usually of a reddish color, in various shade from light to dark, the shades being mingled in thin streaks; but in some choice sorts they are curled upon one another so as to resemble the feathers of the partridge, whence its name. One variety occurs in which the colors are remarkably bright, and it is consequently called pheasant-wood. In Brazil, this beautiful wood is so plentiful that it is employed in ship-building, and it is said to be used in our navy-yards under the name of cabbage-wood, but this is doubtful; many woods are known as partridge, and several as cabbage-wood. Among the Brazilians, it is called "Angelim," and they describe four sorts—*Angelim de pedra* (the stone angelim), *A. vermelho* (red angelim), *A. amargoso* (bitter angelim), and *A. varzea* (cultivated angelim). Its chief use in this country is for cabinet-work, Tunbridge-ware, parasol-sticks, fans, and other small matters for which its beauty recommends it. It is said to be yielded by the leguminous tree (*Andira inermis*), which is found not only in the Brazils, but in other parts of South America and the West Indies.

PARTS of SPEECH are the several kinds or classes into which the words of a language are divided. There is nothing in the outward form of words that would enable us to divide them into classes. The distinction lies in the *offices* that the several words perform in a sentence (q.v.). All words performing the same office in sentences belong to the same class. The essential parts of speech are the noun, adjective, pronoun, verb, adverb, preposition, conjunction (see these several heads). The articles (q.v.) are not distinct parts of speech, being essentially pronouns; and interjections (q.v.) hardly belong to articulate speech. To name the class or part of speech to which each word of a sentence belongs is called to *parse* it.

PARTURITION. See MIDWIFERY.

PARTY, in Heraldry. See PARTITION LINES.

PARTY NAMES. The following is a list of the principal party nicknames that one meets with in reading the annals of American history:

Abolitionists: Applied originally to those in the north who desired the abolition of slavery; subsequently transferred to the republican party (q.v.). *Adamites:* The partisans of John Quincy Adams. An expression current from 1821–1832. *American Party:* The party that flourished about 1853 and took for its motto, "America for the Americans." Also known as the "Know-nothing party." *Anti-Federalists:* The earliest name for the democratic party (q.v.). *Anti-Masons:* A party that flourished from 1826–1840, because of the alleged murder of Morgan (q.v.) by the masons in 1826. *Anti-Nebraska Men:* A party formed in 1854 by whigs opposed to the Kansas-Nebraska bill (q.v.). *Anti-Renters:* A party flourishing in New York state in 1837–47 to oppose the collection of rent by the "Patroons" (q.v.). *Barnburners:* The radical wing of the democratic party in New York state in 1848, opposed to the hunkers (q.v.), and subsequently coalescing with the free-soil party. *Black Republicans:* A name given by the extreme democrats during the war to the republicans, as being friendly to the emancipation of the blacks. *Bourbons:* Originally applied to southern democrats of the old school, but now used of any reactionary who adheres obstinately to tradition, and like the Bourbons of France, "Learns nothing and forgets nothing." *Bucktails:* A New York state faction organized in 1815 to oppose Geo. Clinton's administration. The badge was a bucktail worn in the hat. *Burrites:* An independent faction of the democratic party headed by Aaron Burr (q.v.) in 1797. *Copperheads:* A name given by republicans during the civil war to those northerners who sympathized with the south. *Democrats.* See the article in vol. IV. *Doughfaces:* A name scornfully applied by John Randolph, of Roanoke, to those northern congressmen who aided the slave-owning interests by their votes. *Drys:* A nickname given to the prohibition party (q.v.). *Dutch:* A name given in 1842 to the democratic supporters of Van Buren. *Federalists.* See the article in vol. V. *Fire-Eater:* Equivalent to *Bourbon* (q.v.). *Free Soilers:* The early name of the republican party, assumed in 1848, or earlier. *Grangers.* See the article in vol. VII. *Greenbackers:* A party advocating the issue of an irredeemable paper currency, and active in 1870–78. *Half-Breeds:* The moderate wing of the New York republicans in 1880–1885. Opposed to the *Stalwarts* (q.v.). *Hunkers.* See BARNBURNERS. *Jacksonites:* Followers of Andrew Jackson (q.v.), and thus opposed to the *Adamites* (q.v.). *Know-nothings.* See article AMERICAN PARTY in vol. I. *Liberals,* or *Liberal Republicans:* The name adopted by the seceding republicans who opposed Gen. Grant's second election to the presidency, and supported Horace Greeley. *Loco-Focos:* A popular nickname for the democrats prior to 1860. See the article in vol. IX. *Loose Constructionists:* Those favoring a liberal interpretation of the constitution. *Mahoneists:* The followers of Gen. William Mahone, of Virginia, who seceded from the democratic party in 1878. See READJUSTERS. *Mossbacks:* A name given to the section of the democratic party of Ohio who followed the oldest leaders of the party. *Mugwumps:* See the main article in vol. IX. *Native Americans.* See AMERICAN PARTY. *Nullifiers:* Those who in 1832 advocated the right of a state to "nullify" the United States tariff law. *Prohibitionists:* The party favoring the abolition by law of the manufacture and sale of ardent spirits. *Radicals:* The extreme wing of the republican party. Opposed to liberals (q.v.). *Readjusters:* A local party headed by Gen. William Mahone, who favored a conditional repudiation of the Virginia state debt. *Republicans.* See the article in vol. XII. *Short Hairs:* A name for the rougher element of the democratic party in New York city. Opposed to *Swallowtails. Silver Greys:* The conservative section of the whig party (q.v.). *Stalwarts:* The "straight-out" wing of the republican party in New York state from 1880–1885, headed by Roscoe Conkling. *Strict Constructionists:* Those favoring a stringent interpretation of the constitution. *Swallowtails:* The aristocratic section of the New York city democracy. Opposed to *Short Hairs* (q.v.). *Unionists:* Southerners who during the civil war favored the preservation of the Union. *Washingtonians:* The early name of the prohibition party (q.v.). *Whigs.* See the article in vol. XV. *Wets:* A name for those opposed to the "drys" or Prohibitionists. See above. *White League:* An organization formed at the south to prevent the political ascendency of the negroes. *Yankees:* The popular name at the south for the unionists during the war. See also FARMERS' ALLIANCE; LILY WHITES; POPULIST PARTY.

PARTY-WALL is the wall dividing two houses or tenements, and which is, in a certain sense, one and indivisible, though the property of two or more parties. The question as to who is the owner of any particular part of the party-wall, is solved by ascertaining who is the owner of the soil on which it is built. In the absence of evidence to the contrary, it is presumed that half of the soil belongs to the owner on one side, and the other half to the owner of the other side; and, unless the wall has stood twenty years and upwards, each owner can do what he likes with his own half, and can pare it away if he likes. But in general, mutual interest prevents each party from resorting to his strict legal rights. A practice exists for one who builds a house adjoining the wall of a neighbor, to pay for half the expense. In Scotland, a party building close to the wall

of another's house can compel the owner of the first house to give him half of the wall or gable, on paying half the expense; while in England there is no such compulsion.

PASADENA, city and popular health resort in Los Angeles co., Cal.; on the southern California and the Los Angeles terminal railroad; 9 miles n.e. of Los Angeles, the co. seat. It is located at the foot of the Sierra Madre mountains, in the midst of magnificent scenery, in what has well been called the "Italy of America"—a land of perpetual sunshine and refreshing breezes direct from the ocean. There is nowhere a more agreeable climate or more equable temperature, the latter, as officially stated by the board of trade, having in the winter an average of 56°; spring, 61.07°; summer, 67.61°; and autumn, 62.31°—or only a difference of 11.61°. This locality is also conspicuous for the entire absence of marshes, and consequent malaria producing fevers and like disorders, while gout, rheumatism, liver and kidney troubles are alike known only among newcomers, and, as one writer remarks, "cannot be relied on to continue." Pasadena was first settled in 1874 by a colony from Indianapolis, and very soon became prominent for its horticultural enterprise. Such is the fertility of the soil that it would be difficult to name any fruit of the temperate, or semi-tropical zone, that cannot be produced in great profusion, though the citrus fruits are the most abundant. The streets of the city are lighted with gas and electricity, and there are several lines of street railroad. There are also newspapers, a public library, the Throop polytechnic institute, separate classical schools for boys and girls, high school, kindergartens, banks, several churches, and numerous hotels. During the winter months the population has been estimated at 12,000, while the permanent population, '90, was 4882.

PASARGA'DÆ, the ancient capital of Persia, before the foundation of Persepolis, apparently s.e. of that city, near the Carmanian border, on the Cyrus or Kores river in Coele-Persis. Its modern site is not known, but it is believed by Grotesend, Spiegel and others to be at a spot n.e. from Persepolis, where there is an ancient tomb on which is an inscription in three languages and a figure of Cyrus. The inscription is said to read, "I, Cyrus, king of the Achaemenidae." The ancient tribe called Pasargadae dwelt in the vicinity. From it is said to have sprung the royal family of the Achaemenidae.

PASCAGOU'LA, a river, and bay at its mouth, in Mississippi. The river, formed by the junction of the Leaf, the Chickasawha, with numerous branches, drains the southeastern portion of the state, and flows into Mississippi sound through two mouths which form the bay. It is navigable 100 m. through a sandy region of pine forests, supplying turpentine. The villages on the bay are summer resorts from Mobile and New Orleans; and on the shores at night are heard sounds like the Æolian harp, supposed to be caused by some kind of shell-fish.

PASCAGOULA, a town in Jackson co., Miss.; on Pascagoula bay and river and the Louisville and Nashville railroad; adjoining Scranton, the co. seat. It was incorporated as a village in 1890, and as a town in 1896, and has a convent, public and private schools, state bank, artesian well water, weekly newspaper, and a large shipping trade in lumber, fish, oysters, fruit, and vegetables. Pop. '90, not reported.

PASCAL, ADRIEN, 1815–1863; was a French military writer of some repute. He published several works, the more important being *The Military Life of Louis Philippe* (1841); *History of the Army from the Thirteenth Century to our Times* (4 vols., 1845–49); and *History of Napoleon III.* (1853).

PASCAL, BLAISE, one of the most distinguished philosophers and scholars of the 17th c., was b. at Clermont, in Auvergne, France, June 19, 1623. His father, Etienne Pascal, was president of the cour des aides at Clermont. His mother, Antoinette Bezon, died while he was little beyond infancy. He had two sisters—the elder, Gilberte, Madame Perier, afterwards his biographer; the younger, Jacqueline, who became a nun of Port Royal, under the celebrated Mère Angelique, sister of Antoine Arnauld. From childhood, Blaise gave evidence of extraordinary abilities; and when he reached his eighth year, his father resigned his office at Clermont, and came to Paris, In order personally to direct the boy's education. For the purpose of concentrating all the boy's efforts upon languages, his father kept out of his reach all books treating the subject of mathematics, for which he had early evinced a decided taste; and it is recorded that by his own unaided speculations, drawing the diagrams with charcoal upon the floor, he made some progress in geometry. One account represents him as having thus mastered the first thirty-two propositions of the first book of Euclid's *Elements*—a statement which carries its own refutation with it. Thenceforward he was allowed freely to follow the bent of his genuis. In his sixteenth year, he produced a treatise on conic sections, which extorted the almost incredulous admiration of Descartes. In his nineteenth year, he invented a calculating-machine; and turning his attention to the novel questions as to the nature of fluids, which Torricelli's theories had raised, he produced two essays, which, although not published till after his death, have established his reputation as an experimental physicist. His father having accepted an office at Rouen, Pascal was there brought much into intercourse with a distinguished preacher, Abbe Guillebert, a member of the Jansenists, but a man of great eloquence, a great master of ascetic theology, from whom and other members of the same rigid sect, as well as from the writings of

Arnauld, St. Cyran, and Nicole, Pascal's mind received a deeply religious turn; and his health having suffered much from excessive study, he gave himself up in great measure to retirement and theological reading, and to the practice of asceticism. The death of his father, and his sister Jacqueline's withdrawal to Port Royal, confirmed these habits; and it is to this period that we owe his magnificent though unfinished *Pensées*, which have extorted the admiration even of his unbelieving, and therefore unsympathizing, critics. Having fully identified himself with the Jansenist party, he was induced (1655) to take up his residence at Port Royal, although not as a member of the body, where he resided till his death, entirely given up to prayer and practices of mortification, among which practices may be mentioned that of wearing an iron girdle, studded with sharp points, which he forced into his flesh whenever he felt himself assailed by sinful thoughts. In the controversy to which the condemnation of Arnauld by the Sorbonne (1655) gave rise, Pascal took a lively interest; and it was to this controversy that he contributed the memorable *Lettres Provinciales*, published under the pseudonym of Louis de Montalt. These famous letters (eighteen in number, not reckoning the nineteenth, which is a fragment, and the twentieth, which is by Lamaistre), are written, as if to a provincial friend, on the absorbing controversial topic of the day. The first three are devoted to the vindication of Arnauld, and the demonstration of the identity of his doctrine with that of St. Augustine. But it was to the later letters that the collection owed both its contemporary popularity and its abiding fame. In these Pascal addresses himself to the casuistry and to the directorial system of Arnauld's great antagonists, the Jesuits; and, in a strain of humorous irony which has seldom been surpassed, he holds up to ridicule their imputed laxity of principle on the obligation of restitution, on simony, on probable opinions, on directing the intention, on equivocation and mental reservation, etc. In all this, he professes to produce the authorities of their own authors. Of the extraordinary ability displayed in these celebrated letters, no question can be entertained; but the Jesuits and their friends loudly complain of their unfairness, and represent them as in great part the work of a special pleader. The quotations with the exception of those from Escobar, were confessedly supplied by Pascal's friends. It is complained that many of the authors cited are not Jesuits at all; that many of the opinions ridiculed and reprobated as opinions of the Jesuit order, had been in reality formally repudiated and condemned in the society; that many of the extracts are garbled and distorted; that it treats as though they had been designed for the pulpit and as manuals for teaching, works which in reality were but meant as private directions of the judgment of the confessor; and that, in almost all cases, statements, facts, and circumstances are withheld, which would modify, if not entirely remove, their objectionable tendency. See Jesuits. To all which the enemies of the Jesuits reply by arguments intended thoroughly to vindicate Pascal. Pascal himself entertained no compunctious feeling for the production of these letters, but even at the approach of death declared his full satisfaction with the work, such as it was. His later years were made very wretched by continued, or at least frequently recurring hypochondria, under the influence of which he suffered from very painful fantasies, which he was unable to control. His strength was completely worn out by these and other infirmities, and, prematurely old, he died at the early age of 39, in Paris, in the year 1662. His *Pensées sur la Religion, et sur quelques autres Sujets*, being unfinished, were published with suppressions and modifications in 1669; but their full value was only learned from the complete edition which was published at the instance of M. Cousin (Paris, 1844). Of all his works, the *Lettres Provinciales* have been the most frequently reprinted. They were translated into Latin in the lifetime of Pascal by Nicole, under the pseudonym of a German professor, "Wilhelm Wendroc;" and an edition in four languages appeared at Cologne in 1684.

PASCHAL. See Passover.

PASCHAL I., b. Rome, 8th c.; d. 824; abbot of the monastery of St. Stephen at Rome, made cardinal by Leo III., and pope in 817. The donation of Louis the Pious was said to have been made to him. In 823 he crowned Lothaire, son of Louis, as emperor.

PASCHAL II. (Raniero of Bieda) Pope, b. in Tuscany, about the middle of the 11th c.; d. 1118. He was a monk of the order of Clugny, and, having been sent to Rome on the affairs of the monastery, he was made cardinal by Pope Gregory VII. He succeeded Urban II. as pope in 1099. He had a contest in regard to investitures with Henry V., king of the Germans, who went to Italy with an army in order to be crowned as emperor. Paschal proposed a compromise, but when Henry entered with the pope into the Vatican to be crowned the negotiation was broken off, and the pope refused to consecrate the emperor. Henry ordered his soldiers to seize the pope. A scuffle ensued; and the Roman people, enraged at the indignity put upon their pontiff, fell upon the German soldiers, killing some, and drove the rest back to their camp, outside the city. Henry stripped the pope of his pontifical ornaments, bound him with cords, and after keeping him prisoner for two months compelled him to issue a bull giving up the right of investiture to the emperor, and to consecrate him. Henry then returned to Germany. Paschal then summoned a council in the Lateran, which condemned the cession of the right of investiture, and pronounced the investiture of churchmen by lay hands a heresy. Henry again marched to Rome; the pope escaped to Benevento, and Henry caused him-

self to be crowned again by the bishop of Benevento. After Henry's departure Paschal returned to Rome, made preparations for war, but died before he could take the field. The question of the investiture was compromised in 1122 under Calixtus II., so that the bishops elected according to the canonical forms should receive their regalia from the emperor, and do homage for them, but that in the ceremony of investiture the emperor should use the scepter only, and not the ring and crosier, the emblems of spiritual authority.

PASCHAL CHRONICLE, so called because part of it was compiled from the Paschal canons (rules for the Easter festival) of various districts and towns, contains a summary of events in chronological order from Adam to 629 A.D., which was the 20th year of Heraclius. It was at one time named also *Alexandrinum,* because then attributed to a writer of Alexandria. The name of the author, however, is not known. It at first extended, according to the opinion of some, only to 354 A.D., in the reign of Constantius; the continuation of it with additions to the first part being the work of a later compiler. Others, however, regard it all as the work of one man. It is sometimes called also *Fasti Siculi,* because it had been found in an old library in Sicily, from which it was taken to Rome. Notwithstanding its numerous faults both of matter and style, it contains much valuable chronological information. An appended list of emperors from Augustus to Constantine Monomachus is evidently the work of a later author. A convenient edition, 2 vols., 8vo, was published by Dindorf at Bonn, 1832.

PASCO, a co. in western (peninsular) Fla., on the gulf of Mexico, formed 1887 from part of Hernando; 800 square miles; pop. '90, 4249. It is drained by several small rivers and contains much hilly land Products, cotton, oats, rice, corn, etc. Co. seat, Dade City.

PASCO, or CERRO DE PASCO, an important mining city in Peru, in the department of Junin, stands at an elevation of about 14,000 ft. above sea-level, 80 m. n.e. of Lima, in a direct line, but upwards of 130 m. by the winding mountain road. It consists of a collection of huts spread over an area that has been hollowed out and perforated in all directions by mines. The number of the inhabitants varies according to the state of the mines, being sometimes considerably more than 12,000, and often much less. It possesses a journal of literature and mining. The Cerro, or "mountain knot" of Pasco, rises in Sacshuanata, 16,000 ft. above the level of the sea. Coal is found.

PAS-DE-CALAIS (Fr. for strait of Dover), a department in the n. of France, bounded on the n. by the department of Nord and the strait of Dover, and on the w. by the strait of Dover and the English channel. Area, 2,551 sq. m. Pop. '91, 874,638. The surface is level, with the exception of a ridge of hills running from the s.e. to the n.w., ending in Gris-nez cape (q. v.), and forming the water-shed between the North sea and the English channel. The highest point (695 ft.) is reached a little to the s.w. of Desvres. The rivers, which are of no considerable length, are the Scarpe and Lys in the basin of the North sea, and the Authie and Canche belonging to the basin of the English channel. The rivers are navigable within the department, and are connected by canals. The coast-line is 80 m. in length, and the shores are in certain parts low and sandy; while for several miles on either side of Gris-nez, cliffs similar to those of Dover front the sea. The climate is mild, but exceedingly inconstant. The soil is very fertile—all the usual cereal and leguminous crops are produced in abundance—and the country is very productive both as regards agriculture and manufactures. Fishing is actively carried on on the coast, particularly in the neighborhood of Boulogne. Coal of an indifferent quality is raised, the excellent quarries of the department are worked, and considerable quantities of turf are cut. The industrial establishments are numerous and important, as iron-foundries, glass-works, potteries, tanneries, and numerous bleach-works, and mills and factories of various kinds. Boulogne and Calais are the principal harbors. There are six arrondissements—Arras, Béthune, St. Omer, St. Pol, Boulogne, and Montreuil. The capital is Arras.

PASENG. See GOAT.

PASHA', or PACHA, a title used in the Ottoman empire, and applied to governors of provinces, or military and naval commanders of high rank. The name is said to be derived from two Persian words—*pa,* foot or support, and *shah,* ruler—and signifies "the support of the ruler." The title was limited in the early period of the Ottoman empire to the princes of the blood, but was subsequently extended to the grand-vizier, the members of the divân, the seraskier, capitan-pasha, the begler-begs, and other civil and military authorities. The distinctive badge of a pasha is a horse's tail, waving from the end of a staff, crowned with a gilt ball; in war this badge is always carried before him when he goes abroad, and is at other times planted in front of his tent. The three grades of pashas are distinguished by the number of the horse-tails on their standards; those of the highest rank are pashas of three tails, and include, in general, the highest functionaries, civil and military. All pashas of this class have the title of vizier; and the grand-vizier is, *par excellence,* a pasha of three tails. The pashas of two tails are the governors of provinces, who generally are called by the simple title of "pasha." The lowest rank of pasha is the pasha of one tail; the sanjaks, or lowest class of provincial governors, are of this rank. The pasha of a province has authority over the military force, the revenue, and the administration of justice. His authority was formerly abso-

lute, but recently a check was imposed on him by the appointment of local councils. The pasha is in his own person the military leader and administrator of justice for the province under his charge, and holds office during the pleasure of the sultan—a most precarious tenure, as the sultan can at any moment, in the exercise of his despotic power, exile, imprison, or put him to death; and this has frequently been done in cases where the pasha's power has excited the apprehension, or his wealth the avarice of his royal master.

PASIPHAË. See MINOS.

PASKEVITCH, IVAN FEODOROVITCH, Count of Erivan, Prince of Warsaw, and a Russian field-marshal, was b. at Poltava, May 19, 1782. He was descended from a Polish family, and was at first a page to the czar Paul, but entered the army, and served in the campaign in 1805, which was ended by the defeat of Austerlitz; and then against the Turks. He took a prominent part in the campaign of 1812, and several times defeated the French under Eugène, Ney, and St. Cyr; he was also present at Leipsic and the conflicts under the walls of Paris. In 1825 he was appointed commander-in-chief against the Persians, whom he completely defeated, conquering Persian Armenia, taking Erivan, and ending the war by the peace of Turkmanshai (q.v.), a peace exceedingly favorable to Russia. In recompense for these services he was created count of Erivan, and received a grant of 1,000,000 rubles ($793,000). In 1828 and 1829 he made two campaigns against the Turks in Asia, signalized by the taking of Kars, Erzerum, and other important provinces, and terminated by the treaty of Adrianople in 1829. In 1831, Paskevitch, now a field-marshal, was appointed viceroy of Poland, put an end to the revolt within three months after his appointment, and reconstructed the administration on the basis of a complete incorporation with Russia. Such was the vigor and severity of his rule that the eventful year of 1848 passed over without any attempt at revolution. When Russian intervention in Hungary had been resolved upon, Paskevitch, though now 67 years of age, marched into that country at the head of 200,000 men, and, after a junction with the Austrians, defeated the Hungarians in several battles, and by mere force of numbers crushed out the last spark of insurrection. The 50th anniversary of his military service was celebrated at Warsaw, in 1850, with the utmost rejoicings, and on this occasion the sovereigns of Austria and Prussia conferred on him the rank of field-marshal in their respective armies. In 1854 he unwillingly took the command of the Russian army on the Danube; but fortune, which had hitherto invariably smiled upon him, deserted him at Silistria; and after undergoing a succession of sanguinary repulses, and being himself grievously wounded, he withdrew his army, and resigning the command retired to Warsaw, where he fell into a state of profound melancholy, and died Jan. 29, 1856.

PASMA is the name given to a non-officinal healing-powder, which is regarded as very serviceable in burns, ulcers, excoriations, etc. It is composed of 30 parts of silica, 12 of magnesia, 6 of alumina, 2 of protoxide of iron, and 50 of starch from the olgra root.

PAS'PALUM, a genus of grasses, with spikes either solitary or variously grouped, one-flowered spikelets, and awnless paleæ. The species are numerous, natives of warm climates.—*P. scrobiculatum* is cultivated as a cereal in India, where it is called koda. See MILLET. It will grow in very barren soils, and delights in a dry loose soil. *P. exile* is cultivated in like manner in the w. of Africa, where it is called fundi (q.v.) or fundungi.—Other species are valuable as fodder-grasses. *P. purpureum* is a very important fodder-grass in the coast districts of Peru during the dry months of February and March. *P. stoloniferum,* also a Peruvian species, has been introduced into France; but it is apt to be injured by frosts, and seldom ripens its seeds in the neighborhood of Paris.

PASQUE FLOWER, *Pulsatilla,* a genus of plants of the natural order *ranunculaceæ,* by many botanists still included in *anemone,* the chief distinguishing characteristic being the long feathery awns of the fruit. The species are perennial, silky, herbaceous plants, with doubly pinnatifid or doubly trifid leaves, and a simple one-flowered scape. They are narcotic, acrid, and poisonous. The common pasque flower (*pulsatilla vulgaris* or *anemone pulsatilla*) is a native of many parts of Europe, and of chalky pastures in several parts of England. It has widely bell-shaped bluish-purple flowers. Another species, *P.* or *A. pratensis,* a native of the continent of Europe, not of Britain, has smaller and more perfectly bell-shaped blackish-purple flowers.—These plants emit, when bruised, a pungent smell; and contain, as their principal constituent, a peculiar pungent essential oil, which, in combination with *anemonic acid,* forms an acrid and very inflammable substance called *anemonine,* or *pulsatilla camphor,* and is sometimes used in medicine. *Pulsatilla* is a favorite medicine of the homeopathists. *Easter eggs* are colored purple in some places by the petals of the pasque flower.—More acrid than any of the species just named is *pulsatilla potens,* which occasionally even blisters the skin.

PASQUIER, ÉTIENNE, 1529–1615; b. in Paris, of an esteemed family; educated for the bar, under the ablest jurists of France and Italy, and at the age of 20 received as an advocate in Paris courts. In 1560 he commenced the publication of his most important work, entitled *Récherches de la France,* and another, entitled *Pourparler du Princé.* The former has ever since been a classic authority. In 1564 he distinguished himself at the bar by a defense of the university of France against the claims of the Jesuits to establish

their authority within its circle; and by the lofty ground upon which he based the objection for the state itself rather than for the university, the masterly fullness of his arraignment of all the elements of dangerous political power that lay in the nature of their organization, his speeches became the first great arraignment of the order, then only 44 years from its origin. Immediately translated into all the continental languages, Pasquier's pleadings for a long time were the chief weapons of opposition to the growing power of that order. Henry III. made him advocate-general in 1585, deputy to the states-general at Blois in 1588, and member of a parliament of magistrates in 1589. The eight volumes of the *Récherches*, etc., above mentioned, treat, 1st, of the establishment of the French—the origin of the nation; 2d, of magistrates, parliaments, states-general; 3d, of ecclesiastical affairs, the power of the popes, and the liberty af the Gallican church; 4th, of judgments, procedures, and customs; 5th, various historical questions; 6th, celebrated trials; 7th, of the origin of French poetry and of the language; 8th, of the French language, 9th, of French literature, the university, and its studies. Selections from his works, entitled *Œuvres Choisies*, were published by M. Feugère, Paris, 1840. The letters of Pasquier, published in 1586, and again in 1619 in 4 vols. quarto, originally appeared in 22 vols. They form a picturesque panorama of the life and thought of the times in which he lived; sketches of history and law, of biography, of manners and customs, all given with a liveliness and warmth of style equal to the models of similar writings with which later French literature abounds.

PASQUIER, Étienne Denis, Duc de, 1767–1862; a descendant of the great jurist author Étienne; born, educated, and died in Paris. He was early in government employ; in 1806 attracted the favor of Napoleon, and not long after became *procureur-general* of the seals, and of titles, and then prefect of police; director of roads and bridges under Louis XVIII., and minister of the interior; minister of justice in 1817; of foreign affairs in 1819. In 1820 he became conspicuous for his advocacy of absolutism, and used the expression, become famous, that "despotism specifically expressed becomes a salutary remedy in great perils." After 1821 he sat in the chamber of peers; in 1830 gave adhesion to Louis Philippe; was made chancellor, and in 1844 duke. In 1842 he became a member of the French academy by the same courtier-skill which made his road smooth to royal favor through four different reigns, which favor he seems to have partly merited by a wise business administration.

PASQUINADE, an anonymous or pseudonymous publication of small size, sometimes printed, sometimes only posted up or circulated in manuscript, and having for its object the defamation of a character, or at least the turning of a person to ridicule. The name is derived from *Pasquino*, a tailor remarkable for his wit and sarcastic humor, who lived in Rome towards the close of the 15th c., and attracted many to his shop by his sharp and lively sayings. Some time after his death, a mutilated fragment of an ancient statue, considered to represent Menelaus supporting the dead body of Patroclus, was dug up opposite his shop, and placed at the end of the Braschi palace, near the piazza Navoni. It was named after the defunct tailor, and thus the practice originated of affixing to it placards containing satires and jests relative to the affairs of the day—the pope and the cardinals being favorite victims of the invisible satirists. It till recently continued to be the only outlet which the Roman had for his opinions and feelings. One or two may be quoted as specimens of the mordant style of the Pasquin statue. "Great sums," said the satirist one day, in an epigram addressed to Pope Paul III., "were formerly given to poets for singing; how much will you give me, O Paul, to be silent?" On the marriage of a young Roman called Cesare to a girl called Roma, the statue gave the following advice: "Cave, Cæsar, ne tua Roma respublica fiat." Next day the rival statue of Marforio, in the capitol, replied: "Cæsar imperat;" to which Pasquin, with exquisite malice, retorted: "Ergo coronabitur."

PAS'QUOTANK, a co. in n.e. North Carolina, having the Pasquotank river for its e. boundary, flowing into a bay of the same name, and Albemarle sound on the s.e.; bounded on the w. by Little river, an outlet like the Pasquotank, of a lake in the n. section; 200 sq.m.; pop. '90, 10,748, chiefly of American birth. It is intersected by the Dismal Swamp canal; connecting its co. seat with Norfolk through the Pasquotank river. Its surface is low and swampy, the Dismal swamp extending into its n. portion. Its soil is very fertile along the water courses, and produces grain, cotton, sweet-potatoes, and pork. Its leading industries are the manufacture of lumber and coaches. Co. seat, Elizabeth City.

PASSAGE, West, a sea-port town upon the western shore of the estuary of the river Lee, in the county of Cork, Ireland, which has risen into importance chiefly as a watering-place, and as the shipping-port and marine suburb of the city of Cork, from which it is distant, by the Cork and Passage railway, about 6 miles. As the river above Passage is not navigable for ships above 400 or 500 tons burden, ships of higher tonnage discharge their cargoes at Passage. It is also a ship-building station. Pop. 2,389, about four-fifths of whom are Catholics. The rest belong mainly to the Protestant Episcopal church, other denominations being sparsely represented.—There is another small town of the same name, East Passage, near the mouth of the Suir, in the county of Waterford, Ireland.

PASSAGLIA, CARLO, a Roman Catholic theologian of great eminence, who has obtained much notoriety in connection with the recent movement for the unity of Italy, is a native of the duchy of Lucca, where he was born May 2, 1812. His origin is very humble, and he entered extremely young as a scholar of the Jesuit society, of which he was enrolled a member in the year 1827. Having obtained much distinction in the schools of the order, and having, as is usual with its members, taught for some time in the lower schools, he completed his theological studies in the Roman college, and was appointed professor of canon law, and eventually of dogmatical theology. His reputation for learning stood in the very first rank of Roman Catholic theology, and his lectures were exceedingly admired for their eloquence and erudition, but were considered in some respects too diffuse for the class of pupils who frequented his school. During the temporary withdrawal of the Jesuits from Rome in 1848–51, Passaglia, with some of his brethren, came to England, where he taught theology to the young brethren of his order, and on the re-establishment of the Jesuits in the Roman college, he resumed possession of his chair. During the discussions which preceded the definition of the doctrine of the immaculate conception of the Virgin Mary (see MARY), Passaglia published an elaborate treatise on the doctrine and history of that question, which was published at the cost of the Roman government. Soon afterwards, however, the dissatisfaction which was expressed at the unsuitable character and method of his lectures by the authorities of the order led to his resignation of the professorship of theology. Still, however, he continued a member of the society; and the pope, who felt a warm friendship for him, established in the Roman university a special chair of philosophy for him, which he did not long retain. In 1858 or 1859 he left the society of the Jesuits, and entered warmly into the discussions as to the temporal power of the pope, in connection with which he undertook a voluntary mission to Turin, which, however, led to no results. Having fallen under suspicion in Rome, and his house having been invaded by a domiciliary visit of the police, he withdrew from that city to Turin, where he established a journal entitled *Il Mediatore,* which appeared till 1866. He was appointed by the king professor of moral philosophy, and subsequently of theology in the university of Turin. In 1863 he became a member of the Turin parliament, but his success fell far short of his reputation. He is said to have sought reconciliation with the church, but to have failed to make the required retraction. He died in 1887.

Passaglia's principal works are the treatise on the immaculate conception already referred to (4 vols. 4to); a treatise (Latin) on the primacy of St. Peter (8vo, 1850); a scholastic treatise entitled *Commentarius Theologicus de Partitione Divinæ Voluntatis* (8vo, Rome, 1851); an apology for the cause of Italian unity, entitled *Pro Causa Italica; ad Episcopos Catholicos* (Florence, 1861), in which he recommends the church to make peace with the nation; several essays on religious and political subjects, and recently a learned and very detailed reply to Renan's *Vie de Jésus* (Italian).

PASSA'IC, a river of New Jersey, rises in Morris co., and after a circuitous south-easterly course of 100 m., empties into Newark bay. It is navigable for steamboats and sloops for about 15 miles; and its falls of 72 ft. at Paterson furnish water-power to numerous factories, and are an attraction to tourists.

PASSA'IC, a co. in n. New Jersey, bordering on New York; drained by the Passaic, Pequannock, Ringwood, and Ramapo rivers; intersected by the Delaware, Lackawanna, and Western railroad, by the main and branch lines of the New York, Lake Erie, and Western, and by the Morris canal; 197 sq. m.; pop. '90, 105,046, chiefly of American birth. The soil is fairly fertile, and there are extensive manufactures of silk goods and sewing silk, and of machinery and iron-ware. Co. seat, Paterson.

PASSAIC, a city in Passaic co., N. J., on the Passaic river, and the Erie, the Delaware, Lackawanna and Western, and the New York, Susquehanna, and Western railroads; 11 m. n.w. of New York. It has electric lights, electric street railroads connecting with Newark, Paterson, and Hoboken, high school, public library, emergency hospital, waterworks, national and state banks, over 20 churches, fine city hall, rubber and woolen mills, print works, large vineyard and winery, and daily and weekly newspapers. Pop. '90, 13,028.

PASSAMAQUOD'DY BAY opens into the Atlantic ocean through the bay of Fundy, between Maine and New Brunswick. It is 12 m. long by 6 wide, and shut in by a cluster of islands so as to form an excellent harbor. It receives the St. Croix, Didgequash, and other rivers, and forms the harbor of the flourishing city of Eastport.

PASSANT, a heraldic term used to express the attitude of an animal in a walking position, with his head straight before him.

PASSA'ROWITZ, or POSHAREWATZ (Servian, *Pozarevaz*), a t. in the principality of Servia, 5 m. s. of the Danube. Its streets are wide and unpaved, its houses detached, and surrounded with palisades. Pop. '90, 11,134. The town is chiefly noteworthy for the treaty which was signed here by Prince Eugene and the grand vizier, July 21, 1718.

PASSAU, an ancient and picturesque city of Bavaria, at the confluence of the Inn and the Ilz with the Danube, 72 m. s. e. of Ratisbon. It consists of Passau proper (triangular in shape, and occupying an eminence on the tongue of land between the right bank of the Danube and the left bank of the Inn), and the suburbs, Innstadt, on the right bank of the Inn; Anger and fort Oberhaus, between the Danube and the

Ilz; and Ilzstadt, on the left bank of the Ilz. At the point of junction, the Inn is both wider and has had a longer course than the Danube, the former being 834 ft.; while the latter is only 696 ft. wide. The railway bridge and another iron bridge on eight piers of granite, connect Innstadt with Passau, and the Danube is crossed by a fine bridge resting on seven piers, also of granite. Fort Oberhaus, on the left bank of the Danube, stands on steep, wooded cliffs, at an elevation of upwards of 400 ft., and is connected with the castle of Niederhaus by old walls; both are now used as prisons for criminals from the upper classes and military offenders. The appearance of Passau, situated at the confluence of two great rivers, and rising like an amphitheater on the most beautiful spot of the Danube, is strikingly effective and picturesque. Among the chief buildings are the cathedral, the bishop's palace, the post-office, where the treaty of Passau was signed in 1552; the Jesuits' college, a large building now used as a school; and the church of St. Michael's. In the cathedral square (Domplatz) is a bronze statue of king Maximilian Joseph, erected in 1828. Passau contains also numerous picture galleries, collections of antiquities, and benevolent and charitable institutions. The women of Passau are famous for their beauty. Pop. '90, 16,633.

The natural advantages of this site, in a military point of view, were appreciated at an early period by the Romans, who erected a strong camp here, garrisoned it with Batavian troops, and from this circumstance named it *Batava Castra*. Passau was long the seat of an independent bishopric founded in the 7th c., but secularized in 1803.

PASSAVANT, Johann David, 1787–1861; b. Frankfort-on-the-Main; painter and art critic, studied in Rome and Paris, eventually became inspector of the Städel museum at Frankfort. He published, 1839–58, *Rafael von Urbino und sein Vater Giovanni Santi*, 3 vols.; in 1853, *Die Christliche Kunst in Spanien;* and, 1860–64, *Le Peintre-Graveur*, 6 vols., a history of engraving highly esteemed.

PASSAVANT, William Alfred, d.d. (1824–94), philanthropist, is well known as the founder of hospitals and orphan asylums, at various places in the United States. In 1870 he assisted A. Louis Thiel in founding Thiel college at Greenville, Pa. He introduced the order of deaconesses into the U. S., and was founder and editor of the Pittsburgh *Workman* and editor of *The Missionary* and *The Lutheran.*

PASSECAILLE and PASSEPIED, two old French dances, the music of the former being in $\frac{3}{4}$, the latter in $\frac{6}{8}$ time. Compositions under these names, suggestive of the dances in question, though not meant for dancing, occur among the "suites," or collections of short pieces for the harpsichord or clavichord by Sebastian Bach, and Handel.

PASSEMENTERIE is a French term applied at present to all gold or silver lace, or to trimmings made of gimps, cords, or ornamental patterns in jet. Early in the seventeenth century the French called all lace *passement*, and the lace trade was entirely in the hands of the "passementiers" of Paris, hence all fancy trimmings came to be called passementerie.

PASSENGER PIGEON, *Ectopistes migratoria,* a species of pigeon, native of North America, and particularly interesting from the marvelous numbers of which its flocks are often composed. The genus to which it belongs has, like the turtle doves, a bill more slender than the ordinary pigeons, notched, and with a tumid fleshy covering above at the base; the head is small in proportion to the body, the legs are short and strong, the feet naked, the tail either rounded or wedge-shaped, the wings long and pointed. The passenger pigeon, generally known in North America as the wild pigeon, has a long wedge-shaped tail; the whole length being from 15 to 17 in., of which the tail occupies nearly one half. It is a beautiful bird, of very graceful form and finely colored plumage. The plumage of the female is duller than that of the male.—The passenger pigeon is found in almost all parts of North America, from the gulf of Mexico to the Arctic regions. It is not, properly speaking, a bird of passage; its migrations being apparently altogether consequent on the failure of the supplies of food in one locality, and the necessity of seeking it in another, and not connected with the breeding season or the season of the year. Its power of flight is very great, and it is supposed to be able to sustain a long flight at the rate of 60 m. an hour. Passenger pigeons have been killed in the neighborhood of New York, with their crops full of rice, which they must have collected in the fields of Carolina or Georgia not many hours before. The nest of the passenger pigeon in the American forests generally consists of a few dry twigs placed in a fork of the branches of a tree, and containing two eggs, sometimes only one egg. They breed two or three times in a season. In the backwoods, vast numbers of pigeons build in one breeding-place; many nests, sometimes 100 or more, are often to be seen in one tree. These great breeding-places extend over a tract of forest, sometimes not less than 40 m. in length; but in the more cultivated parts of the United States the passenger pigeon builds singly and not in communities. Flocks of them are to be seen flying at a great height in dense columns, 8 or 10 m. long; and there is reason to suppose, from the rapidity of their flight, and the number of hours taken by a column in passing a particular spot, that in some of their great migrations the column, a mile broad, is more than 150 m. long. Perhaps nothing is so wonderful in relation to any species of bird as the size of their roosting-places. The noise of wings and of cooing voices is as loud as thunder, and is heard at the distance of miles. It drowns the report of guns. The multitudes which settle on trees, break down great branches by their weight, so that it is dangerous to pass beneath. They crowd together, alighting one upon another, till

they form solid masses like hogsheads, and great numbers are killed when the branches break. The inhabitants of the neighboring country assemble, shoot them, knock them down with poles, stifle them by means of pots of burning sulphur, cut down trees in order to bring them in great numbers to the ground, eat them, salt them, and bring their hogs to fatten on them. Wolves, foxes, lynxes, cougars, bears, raccoons, opossums, polecats, eagles, hawks, and vultures all congregate to share the spoil. The flesh of the passenger pigeon is of a dark color, but tolerably pleasant. That of young birds is much esteemed. The nestlings are in general extremely fat, and are sometimes melted down for the sake of their fat alone. The food of the passenger pigeon consists chiefly of beech-mast and acorns, but it readily eats almost any kind of nut, berry, or seed.

PASSENGERS BY LAND AND SEA. The common law affecting passengers by land, in a carriage or public conveyance, is concisely as follows: The owners of the railway or other carriage do not contract to carry the passenger with perfect safety; they do not warrant that he will not be injured; but they merely contract to carry him without any negligence on their part.

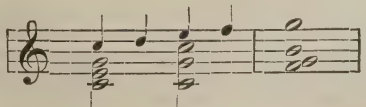
In the case of passengers by sea, a peculiar code has been constructed, owing to the peculiarity of their situation. The fundamental rule of the common law is the same as on land carriage—that the carrier by sea does not engage to carry with absolute safety, but merely to omit nothing in his power, and to use due care. The legislature, however, has passed statutes to regulate the duties of carriers by sea, so as to secure due care; and their minute and detailed regulations apply to every sea-going vessel, whether native or foreign, carrying more than 50 passengers. Payment of the passage money must be made before commencing the voyage, and the owners are not bound to forward steerage passengers by the very ship contracted for, if an equally eligible ship be offered, provided, however, that families are not to be separated. If the ship is disabled on the voyage, the owners are bound to repair the ship in six weeks, or send on the passengers. If the passengers exceed 300, a medical practitioner must be on board, and the provisions must be according to a certain scale of diet. The emigration commissioners require to inspect emigrant ships, and to give a certificate as to fitness.

In the United States, as in England, common carriers of passengers are bound to use the greatest possible care in fulfilling their contracts for the transportation of their patrons; but there is a difference between the states as to the question of the effect of contributory negligence on the part of the passenger. In many states, as in England, the burden of proof is upon the carrier to show that the negligence of the passenger contributed to the injury; but in others (as N. Y.) the passenger must establish affirmatively that he was not guilty of negligence, or else he cannot recover. There has been much discussion as to the relative merits of these conflicting rules; and while it must be confessed that the English rule has a wholesome influence upon railroad companies and other carriers, it must also be admitted that it often opens the door to fraud, and causes the companies to be unjustly mulcted in damages. All states agree that where the passenger is clearly negligent he cannot recover damages; but there are distinctions in some of the western states as to the degrees of negligence which are not generally recognized. Carriers are particularly liable for any acts of ill treatment which a passenger may suffer at the hands of their employés. And the relation of carrier and passenger can be created by a *bona fide* intention on the part of the passenger. In general the carrier must accept all who apply to be carried; but drunkenness, refusal to pay fare, the fact that there is no room in the conveyance, the fact that the person applying is afflicted with a contagious disease, or that the person is a fugitive from justice—all have been held sufficient to excuse a carrier from receiving the person for transportation. The carrier may, however, make reasonable regulations for the proper conduct of his business; and for this reason a regulation that colored persons should ride in a particular car may not be unlawful, if the accommodations so provided are equally agreeable with those allotted to the white passenger. Full provisions for the health and safety of passengers at sea have been made by the U. S. law.

PASSERINE BIRDS. See INSESSORES.

PASSING-BELL, a bell tolled during the death agony of a dying person, at the moment of the soul's "passing" from earth to its eternal abode. Its use in Catholic countries is to invite the hearers to join in the prayers which are ordered "for the dying in their hour of agony," and which the priest with his attendants recite in the death chamber. See BELL.

PASSING NOTES, in music. In passing from one chord to another, an intervening note, not belonging to either chord, may be used to assist the progression. Such a note is called a passing note or note of transition, as the notes D and F in the upper part of the subjoined example:



PASSION CROSS, a cross of the form on which our Savior suffered, with a long stem and a short traverse near the top. It is of occasional occurrence as a heraldic charge,

though less frequent than many other varieties of cross. A passion cross, when elevated on three steps or degrees (which have been said by heralds to represent the virtues of faith, hope, and charity), is called a cross Calvary.

PASSION-FLOWER, *Passiflora,* a genus of plants almost exclusively natives of the warm parts of America, and belonging to the natural order *passifloraceæ;* an order of exogenous plants, of which more than 200 species are known, mostly climbers, having tendrils which spring from the axils of the leaves, herbaceous or half shrubby, natives of tropical and subtropical countries, but rare in Asia and Africa. The leaves of the *passifloraceæ* are alternate, simple, and variously lobed. The flowers are generally hermaphrodite, with a colored calyx, generally of five segments; the segments of the corolla equal in number to those of the calyx or absent, and several rows of filamentous processes springing from within the cup which is formed by the consolidated calyx and corolla; the stamens, generally five, and generally united by their filaments, inserted at the base of the tube of the calyx; the ovary free, generally elevated on a long stalk, one-celled; three thick styles with dilated stigmas; ovules numerous. The fruit is either fleshy or capsular. In the passion-flowers it is fleshy. This genus has received its name from fanciful persons among the first Spanish settlers in America, imagining that they saw in its flowers a representation of our Lord's passion; the filamentous processes being taken to represent the crown of thorns, the nail-shaped styles the nails of the cross, and the five anthers the marks of the wounds. The species are mostly half shrubby evergreen climbers, of rapid growth; and most of them have lobed leaves, with from two to seven lobes. The flowers of many are large and beautiful, on which account they are often cultivated in hot-houses. Some of the species are also cultivated in tropical countries for their fruit, particularly those of which the fruit is known by the name granadilla (q.v.). The fruit of *P. edulis* is also somewhat acid and of a pleasant flavor, and ices flavored with it are delicious. Its fruit is about two inches long, and an inch and a half in diameter, of a livid purple color, with orange pulp.

PASSIONISTS, a religious congregation of priests of the Roman Catholic church, the object of whose institute, indicated by their name, is to preach "Jesus Christ and him crucified." The founder, Paul Francis, surnamed Paul of the cross, was born in 1694 at Ovada, in the diocese of Acqui in the kingdom of Sardinia. Having commenced his career as a hermit, he formed the design of enlisting others in the missionary life; and being ordained priest in 1737, he associated himself with ten others, and obtained for his plan the approbation of successive popes, together with the convent on the Celian hill at Rome, which still forms the mother-house of the congregation. The special object of the institute was to instill into men's minds by preaching, by example, and by devotional practices, a sense of the mercy and love of God as manifested in the passion of Christ. Hence the cross appears everywhere as their emblem, in their churches, in their halls, and in the courts and public places of their monasteries. A large crucifix, moreover, forms part of their very striking costume. They go barefooted, and practice many other personal austerities, rising at midnight to recite the canonical hours in the church; and their ministerial work consists chiefly in holding what are called "missions" wherever they are invited by the local clergy, in which sermons on the passion of Christ, on sin, and on repentance, together with the hearing of confessions, hold the principal places. Paul of the cross died in 1775.

PASSION MUSIC, music composed to celebrate the Passion during Holy Week. The earliest known Passion is a solemn plain chant melody which was handed down by tradition. A version of this was published by command of Pope Sixtus V. by Giudetti (Rome, 1586). S. Gregory Nazianzen (330–390) was the first to arrange the history of the Passion in a dramatic form. From the beginning of the 13th century until the 16th, the Passion was sung by three deacons, but in 1585 Vittoria made a polyphonic setting of the words formerly spoken by the congregation, and these were found effective and continued in use. This was published by Gardano (Rome, 1585). Francesco Suriano also made a polyphonic setting for four voices (contained in Broske's *Musica Divina,* vol. IV.). The old church form of the Passion contained a dramatic germ, which developed into the mystery and miracle plays originally performed in the churches, and valuable specimens of the music to them is extant. In Germany, passion music reached its climax with Bach, and was developed through these old forms, and through the influence of the Italian oratorio, into a new type both simple and intricate. The greatest example of Passion music is that after Matthew, set by John Sebastian Bach, and first performed at St. Thomas's Church, Leipsic, in April, 1729. The music is written for two choruses, each with its separate orchestral and organ accompaniment. It also contains many beautiful and ancient German chorales. Bach also wrote other settings of the Passion—St. John, 1724; St. Mark, 1731; St. Luke, 1733; and one that is lost. Other Passion music was composed by Obrecht, 1538; Orlando di Lasso, 1575; Bartholomäns Gese, 1588; Vulpius, 1613; Heinrich Schütz, 1645; Sebastiani, 1672; Remhard Keiser, 1704; Telemann, 1716; Graun, 1756; and many others. See Winterfeld, *Der Evangeliche Kirchengesang,* III.; Bitter, *Geschichte des Oratoriums;* Spitta, *Bach* (Bell's translation, II.); Monat, *Shelfte für Musikgeschichte,* III.; and *Vierteljahreschrift für Musikwissenschaft* (1888).

PASSION PLAY. See MYSTERIES.

PASSION-WEEK, the name commonly given in England to the week immediately preceding Easter, and otherwise called holy week (q.v.). But by the proper rubrical usage, passion-week is that which precedes holy week, commencing on PASSION SUNDAY, the fifth Sunday of Lent.

PASSOM'ETER, a watch-shaped instrument carried about the person to register the steps taken in walking. It consists of a dial and two hands, which are moved by a ratchet worked by a weight which the motion of walking causes to vibrate.

PASSOVER, *Pesach, pascha,* the first and greatest of the three annual feasts (*regalim*) instituted by Moses, at which it was incumbent upon every male Israelite to make a pilgrimage to the house of the Lord. It was celebrated on the anniversary of the exodus from Egypt—i.e., on the 14th day of Nisan, otherwise called Abib, the period of the first full moon in the spring—and lasted eight days. In commemoration of the incidents connected with the great event of the liberation of the people, it was ordained that unleavened bread only should be eaten during this festive period, whence it also bore the name *chag hamazzoth* (feast of unleavened bread); and, further, that a lamb one year old, and free from all blemish, roasted whole, together with bitter herbs, should form the meal in every house on the eve of the feast. Prayers and thanksgivings, all with a reference to the redemption from bondage, accompanied the repast, at which the members of the family or families who had joined in the purchase of the lamb had to appear in traveling garb. At a later period, a certain number of cups of red wine were superadded to this meal, to which, as its special ceremonies and the order of its benedictions were fixed, the name *seder* (arrangement) was given. The name passover was more strictly limited to the first day in which the paschal lamb was entirely consumed, the reserving of any part of it to the next day being expressly forbidden (Ex. xii. 10); and the name feast of unleavened bread belonged rather to the remaining days.

The passover is generally regarded by Christian theologians as at once a sacrifice and a sacrament, and in the former character as an eminent type of the sacrifice of Christ. The death of Christ at the very time of the passover is regarded as corroborative of this view, which is indeed plainly adopted in certain passages of the New Testament, as John xix. 36, and 1 Cor. v. 7, in which last place our Saviour is designated "Christ our Passover." The passover is regarded as typical of Christ, in its connection with the deliverance of Israel from the bondage of Egypt, held to typify our salvation from the bondage of sin; in its being a sacrifice, and that of a lamb without blemish—the perfection of the paschal lamb, as of the other sacrificial victims, being supposed to signify the perfection of the great sacrifice; and in many other minor particulars, of which one is that referred to in John xix. 36, that no bone of the paschal lamb was to be broken.

The paschal meal, as at present celebrated among the Jews, has more the character of a hallowed family feast, with reference, however, to the great national event. The greater part of those, it may be added here, who live out of the Holy Land celebrate it on the two first evenings, as owing to the uncertainty prevalent at one time with respect to the fixing of the new moon by the sanhedrim at Jerusalem, it was ordained that the "exiles" should celebrate all their festivals—except the day of atonement—on two successive days, a law still in force among the orthodox. The regulations of the "lamb for each house," the traveling garb, etc., are abrogated, but many further symbolical tokens have been superadded; reminiscences, as it were, both of the liberation from Egypt and the subsequent downfall of the sanctuary and empire. The order of prayers and songs to be recited on these evenings has also received many additions, and even mediæval German songs have crept in, as supposed to contain a symbolical reference to the ultimate fate of Israel. See HAGGADA (*shel pesach*), FESTIVALS, EASTER, LORD'S SUPPER.

PASSOW, FRANZ LUDWIG KARL FRIEDRICH, 1786–1833; b. Germany; educated at Leipsic, where he studied philology and theology. He was called in 1807 to the chair of Greek in the Weimar gymnasium, and in 1815 to that of ancient literature in the university of Breslau. His principal work is his *Dictionary of the Greek Language,* 1831, which formed the basis of Liddell's and Scott's *Lexicon.*

PASSPORT, a warrant of protection and permission to travel, granted by the proper authority, to persons moving from place to place. Every independent state has the right to exclude whom it pleases from its territory, and may require that all strangers entering it be furnished with properly authenticated documents, showing who they are, and for what purpose they are visiting the country. Passports are sometimes issued by the ministers and consuls of the country which the traveler intends to visit, which cannot, however, be done without the consent or connivance of the state of which the holder of the instrument is a subject; they properly proceed from the authorities of the state to which the traveler belongs, and ought to bear the *visa* or countersignature of the minister or consul of the country which he is about to visit. In some European states no one is allowed to go abroad without a passport from his government authorizing him to leave the country—a provision used as a means of detaining persons charged with crime; and passports are even required by the natives to enable them to go from place to place in their own country. The regulations of different states have varied much regarding the use of passports; and of late years there has been a great relaxation of the stringency of the regulations connected with them. Since the facilities of traveling have so greatly increased, it seems to have become the prevalent opinion that the passport system tends to obstruct the free intercourse that is desirable between citizens of different countries;

while it is ineffectual to prevent the entrance of dangerous or suspicious characters, who can obtain passports on false pretenses, or make their way in without them. Within the United Kingdom no passports are required; but for a British subject traveling in some parts of the continent they are still requisite. At one time the greater part of British subjects traveling abroad used to be furnished with passports from the ministers or consuls of the countries which they purposed to visit; the lord provost of Edinburgh was also in the way of issuing passports to Scotchmen. Of late years the passport most used by British subjects is that of the British secretary of state for foreign affairs, which is now granted to any British subject for a fee of two shillings, and is good for life. If the applicant be not personally known to the secretary of state, he must either be recommended to him by some person who is known to him, or produce an application in his favor by some banking firm established in London or elsewhere in the United Kingdom, or a certificate of identity signed by a mayor, magistrate, justice of the peace, minister of religion, physician, surgeon, solicitor, or notary, resident in the United Kingdom. In certain cases the production of a certificate of birth may be required. If the applicant be a naturalized British subject, his certificate of naturalization must be forwarded to the foreign office. If it be dated subsequently to Aug. 24, 1850, and previously to Aug. 1, 1858, his passport will be good for one year only; if subsequently to Aug. 1, 1858, for six months only. The passport of a British subject naturalized by act of parliament is good for life. Where the passport system is in full force, it is required that the passport be countersigned by the minister or consul of the country which the holder means to visit, the visa being only of force for a year. The French government allows British subjects to enter and leave France, and travel in it without passports; but they are said to be sometimes asked for when France is entered from the south and east. In Belgium, Holland, Germany, Switzerland, Austria, Italy, Denmark, Norway, and Sweden, passports are no longer required. For Greece and Portugal they are necessary, and the visa is insisted on in Russia, Turkey, and Egypt. A British subject traveling in countries where passports are not *de rigueur*, will sometimes find it an advantage to have one as an evidence of his identity and nationality. Till lately, throughout the greater part of Europe, a traveler was liable to be called on to produce his passport, not only at every frontier town, but at every garrison town through which he passed. In several of the countries where passports are not required of travelers they are of a decided advantage, if not a necessity, to those who propose to settle there for some time—for example in Germany, especially since the anti-socialist legislation.

In time of war, passports or safe-conducts are granted by the supreme authority on the spot—i.e., the officer in command—to insure safety to the holders when passing from spot to spot, or while occupied in the performance of some act specified in and permitted by the passport. Passports may be granted for goods as well as individuals; and, in time of war, the passport of a ship is the formal voucher of its neutral character. It purports to be a requisition on the part of the government of a state to allow the vessel to pass freely with her company, passengers, goods, and merchandise, without hindrance, seizure, or molestation, as being owned by citizens or subjects of such state.

PASSY, a t. of France, in the department of Seine, a suburb of Paris, and included within the fortifications of that city. See PARIS.

PASTA, GIUDITTA (JUDITH), one of the most distinguished opera singers of modern times, was b. near Milan in Italy in 1798, and received her musical education partly at Como, under the chapel-master of the cathedral there, and partly in the conservatoire at Milan. After 1811 she appeared at various theaters of the second rank in northern Italy, and obtained a respectable success, but did not give any particular indication of possessing more than average ability. Her first great triumph was achieved at Verona in 1822. The year following she was engaged at the Paris Italian opera, where her singing excited great admiration. From this moment she labored incessantly to reach the ideal perfection she had set before her mind. From 1825 to 1830 was the period of her most splendid triumphs, which were won principally in London and Paris. Vienna, where she accepted an engagement in 1832, witnessed the last. Some time afterwards she withdrew from the stage and purchased a villa on the banks of lake Como, where, and at Milan, she resided till she died in 1865. Pasta in her best days had a magnificent voice, which easily passed from clear shrill soprano notes to the gravest contralto tones. In addition she had a fine dramatic energy and stateliness of manner that suited lofty and imposing characters. Her principal rôles were *Medea*, *Desdemona*, *Semiramide*, *La Sonnambula* and *Norma* (these operas were written for her by Bellini) and *Giulia* in *Romeo e Giulia*.

PASTE, a term applied to various compositions in which there is just sufficient moisture to soften without liquifying the mass.

Common or adhesive paste is made by mixing wheaten flour with cold water in the proportion of about two pounds to a gallon. The water is added by degrees, and well stirred in so as to prevent lumpiness. About an ounce of powdered alum is sometimes added to increase its adhesiveness, and for shoe-makers and book-binders about an ounce and a half of finely-powdered rosin is substituted for the alum, which thickens it much and renders it much more tenacious. When the ingredients are thoroughly mixed, they are boiled, great care being taken to stir them thoroughly whilst boiling to prevent burn-

ing. This paste is used for a great variety of purposes, more especially by paper-hangers, bill-stickers, book-binders, pasteboard makers, etc. An adhesive paste, called *Chinese paste*, is made by reducing to perfect dryness bullock's blood. It is then powdered and mixed with one-tenth of its weight of finely-powdered quicklime. When used, it is mixed with water sufficient to form a paste, which is a strong cement for pottery, wood, stone, etc. For other applications of the word paste, see GEMS (IMITATION), and MACARONI.

PASTEBOARD. See PAPER.

PASTEL, chalk mixed with other materials and various colors, and formed into pencils or crayons (q.v.).

PASTEL. See WOAD.

PASTEUR, LOUIS, b. Dôle, France, 1822; made a special study of chemistry, took his degree 1847; appointed professor of physical sciences at Dijon 1848; professor of chemistry at Strasbourg 1849; organized the new faculty of science at Lille 1854. In 1856 he received the Rumford medal of the royal society of London. In 1857 he went to Paris as scientific director of the normal school, and was elected member of the institute. In 1863 he became professor of geology, physical science, and chemistry at the school of fine arts, and was at one time professor of chemistry at the Sorbonne. In 1873 he was elected an associate member of the academy of medicines. He was granted a pension by the French government, in 1874, of 20,000 francs. He contributed several essays to *Annales de Chimie;* in 1863 published *Nouvel Exemple de Fermentation;* 1866, *Etudes sur le Vin;* 1868, *Etudes sur le Vinaigre;* 1870, *Etudes sur la Maladie des Vers de Soie.* His opposition to Pouchet on the subject of spontaneous generation awakened much interest, 1862–65. In molecular chemistry Pasteur achieved important results; and in the province of fermentation and the germ theory (q.v.) his works are of special value. His studies on the diseased conditions of wine and beer have rendered possible the prevention of these conditions. His investigations into the silk-worm's disease, *pebrine,* and its cure, have proved of signal service. His discovery of bacteria as the cause of anthrax (splenic fever) in cattle was an epoch in the science of disease. Similar results were obtained with regard to fowl cholera; and his experiments show success in preventing the various diseases caused by septic bacteria, by inoculating animals with a milder form of the disease by means of a weaker brood of bacteria, artificially cultured. In 1883 he studied cholera in Egypt. Pasteur found that by keeping a cultured crop of specific micro-organisms at a certain temperature with a full supply of oxygen, he could reduce the organisms to an incapacity for producing spores, therefore to sterility; but before this point is reached it is claimed that the cultured organism loses its virulence, although still germinating; and vaccination with it produces a mild disease, which effectually protects from the fatal scourge of splenic fever, of fowl's cholera, and other diseases. In the same manner he dealt with splenic apoplexy (q.v.), which disease he has shown to be due to the presence in the blood of small organisms, specific bacteria. By artificially cultivating these bacteria he further succeeded in developing a weaker crop of germs. By inoculating healthy animals with the virus he produced a milder form of the disease, which is believed to afford protection from the more violent and dangerous malady. He in like manner treated hydrophobia (q.v.). He died Sept. 28, 1895. See GERM THEORY: KOCH.

PASTILE, PASTIL, or PASTILLE, a diminutive of paste. This term was originally applied to lozenges as little portions of confectionary paste, but it has been of late chiefly confined to a mixture of odorous materials, as in the case of the *fumigating pastilles,* which are burned either as incense or as a means of diffusing an agreeable odor. They are composed of charcoal powder, with such aromatic gums as benzoin, labdanum, etc.; and powders of sweet-scented woods and barks, as sandal-wood, cinnamon, and especially cascarilla barks. Essential oils are also added, and the whole are worked into a paste with a little gum-mucilage, and formed into small sharp-pointed cones about an inch and a half high, and half an inch broad at the base. When perfectly dry they are used by lighting at the point, and as they burn down an agreeable odor is given out with the smoke. Very tasteful vessels, called pastille burners, usually of porcelain, are made for using them. Another kind of pastille, usually in the form of a small pill covered with gold or silver leaf, is used for perfuming the breath; it is made of the same kind of ingredients, excepting the charcoal.

PASTON LETTERS, THE, a collection of letters written during the Wars of the Roses by or to the members of the family of Paston in Norfolk. They had been preserved in that family for several generations, then passed through a succession of hands, till they reached Mr. John Fenn, who published them in 5 vols., 1787–94. The authenticity of the series, at first assailed by many historical students, has now been settled beyond a doubt.

PASTOR, a genus of birds of the starling family (*sturnidæ*), differing from starlings in the compressed and slightly-curved bill. In habits, as in characters, they are very nearly allied to starlings. The name pastor is supposed to be derived from their being frequently seen with flocks of sheep. The only European species is the ROSE-COLORED PASTOR, or rose-colored ouzel (*P. roseus*), a rare visitant of Britain and of the northern parts of Europe, and more common in the n. of Africa, Syria, and India.

PASTORAL LETTER, a letter addressed either at certain stated times, or on the occurrence of some notable occasion, by a "pastor," but especially by a bishop to the clergy under his jurisdiction, to the laity of his flock, or to both. Of the former class, in the church of Rome, are the so-called lenten mandates, or instructions, issued before the commencement of lent, and making known the regulations enacted for the observance of the lenten fast, the dispensations granted, and the devotions and other pious works prescribed. Such also are the letters issued by a bishop on many of the chief festivals of the year. It is usual for bishops, besides their stated letters, to address to their clergy or people instructions suited to any particular emergency which may arise, and sometimes to take occasion from the issuing of the stated pastoral letter to offer instruction on some topic of importance which may engage public attention at the time, on some prevalent abuse or scandal, or some apprehended danger to the faith or to morals. To this class belong many of the remains of the early fathers, especially in the western church. In some countries the government, as formerly in Austria, claimed a right to exercise a censorship over the pastoral letters to be issued by the bishops. This right, however, is regarded by churchmen as a usurpation, and although submitted to, is admitted only under protest. See PLACETUM REGIUM, FEBRONIANISM.

PASTORAL POETRY is that kind of poetry which professes to delineate the scenery, sentiment, and incidents of shepherd life. It is highly probable that the first attempts to give a rhythmic expression to human feeling were to some extent of this character. Men were originally shepherds, and their festal songs and hymns would derive at least substance and imagery from their primitive occupations; but as a distinct branch of poetic art, pastoral poetry was not cultivated till a comparatively late period; for although critics are fond of pointing to the lives of the Hebrew patriarchs, and to the story of Ruth, as specimens of the antiquity of the pastoral in the east, yet, as these profess to be history, and not fiction, they can be instanced only to prove that the *material* for this kind of poetry existed from the earliest ages. In point of fact, it was only after innocence and simplicity had passed away, or were thought to have passed away, from real life, that men began, half from fancy, and half from memory, to paint the manners of the past as artless, and the lives of their ancestors as constantly happy. It was thus the *brass* age that made the *golden*. The oldest specimens of the classic pastoral are the Idylls of Theocritus (q.v.), which appeared about 275 B.C.—long after Greece had produced her masterpieces in epic narrative, in the war ode, and almost all other kinds of the lyric, in tragedy, comedy, history, philosophy, and rhetoric. Theocritus was imitated by Bion and Moschus, whose pastorals approximate in form to the drama. Among the Latins, the refined and courtly Virgil, in the reign of Augustus, wrote his *Bucolica* or *Eclogues*, on the model of his Greek predecessors; but, however beautiful and melodious the verses of these urban writers are, we cannot suppose for a moment that the rude shepherds and shepherdesses of Italy or Sicily indulged in such refined sentiments, or spent their time so poetically as there they are made to do. Virgil, we may rest assured, is as far from giving a genuine picture of pastoral life in his verse as any modern poet who prates of Chloe and Phyllis.

During the middle ages, pastoral poetry in this artistic, and therefore conventional, sense of the term, was almost unknown; but with the first glimpse of reviving classicism, the pastoral reappears. The earliest specimens are afforded by Boccaccio (q.v.), about the first modern Italian who studied Greek. It is to the countrymen of Boccaccio that we owe the creation of the pastoral drama, of which there is no trace in ancient literature. The *Favola di Orfeo* of Poliziano (q.v.), performed at the court of Mantua in 1483, is the first dramatic poem which pretends to represent the sentiments, incidents, and forms of pastoral life. Critics have forgotten this work when they make Tansillo the inventor of the *favola pastorale*, or *boscareccia*, on account of his *I due Pellegrini* (1539), or Agostino Beccari, whose pastoral comedy, *Il Sacrifizio*, was played at Ferrara in 1554. However, it is true that the extraordinary popularity of Beccari's piece originated a crowd of *favole boscareccie*, the finest and most poetical of which is the *Aminta* of Tasso, represented at the court of Ferrara in 1572. A later, but hardly less famous production is the *Pastor Fido* of Guarini (q.v.), published at Venice in 1590; and in the 18th c. the poet Metastasio (q.v.) revived for a moment the interest in this graceful and picturesque, but unreal branch of literature. In Spain, during the first part of the 16th c., it abundantly flourished. The first who wrote pastoral dialogues was Juan del Elcina (*cir.* 1500); he was followed by Garcilaso de la Vega, and others. During the reign of the emperor Charles V., one may say that Spanish imaginative literature was almost wholly of a bucolic character; but in Spain, as elsewhere, it took largely the form of prose-romance (see NOVELS) rather than of poetry, deriving its inspiration from the *Daphnis* and *Chloe* of Longus, the Byzantine romancist, not from the tuneful strains of the Mantuan swan. England, however, can boast of Spenser's *Shepherd's Calendar*, which is at least full of charming poetry, and is appropriately dedicated to sir Philip Sidney, whose pastoral romance of *Arcadia* outstrips in point of literary beauty all other fictions of that class. The Germans reckon Shakespeare's *As You Like It* in the list of pastoral dramas; but its right to be so classified is by no means clear, although we may admit that it betrays the influence of the pastoral poetry and romance that had just ceased to be the rage among the scholarly geniuses of Europe. A similar influence is visible in the writings of other

Elizabethan dramatists, as, for example, in the *Faithful Shepherdess* of Fletcher. In France, pastoral poetry is perhaps older than in any of the western nations. The comedy of Adam de Lehalle, surnamed Le Bossu d'Arras (The Hunchback of Arras), entitled *Le Jeu de Robin et Marion* (and which exists in MS, in the *Bibliothèque Impériale*), belongs to the middle of the 13th century. During the civil wars in the latter half of the 16th c. the pastoral was turned to political uses. In the following century, it continued for some time to be popular, or rather, let us say, fashionable. Even the great Richelieu alleviated the cares of office with the composition of *La Grande Pastorale*; but here, too, the poem soon gave way to the prose-romance, which was hardly less unreal, and far more exciting.

Perhaps the best pastoral, ancient or modern, is the *Gentle Shepherd* of Allan Ramsay (q.v.), published in 1725. "It is," says Mr. Carruthers (Chambers's *Cyclopædia of English Literature*, vol. i., p. 601; p. 523 of 3d ed.), "a genuine picture of Scottish life, but of life passed in simple rural employments, apart from the guilt and fever of large towns, and reflecting only the pure and unsophisticated emotions of our nature. The affected sensibilities and feigned distresses of the Corydons and Delias find no place in Ramsay's clear and manly page. He drew his shepherds from the life, placed them in scenes which he actually saw, and made them speak the language which he every day heard—the free idiomatic speech of his native vales." His English contemporaries, Pope, Ambrose Philips, Gay, and others who form the "Augustan," or queen Anne school of poets, also addicted themselves to the composition of pastoral poetry; but though there is much fine description in the verses, they are, in general, purely conventional performances, in imitation of the classic poets, who, as we have said, did not themselves imitate nature. From this censure, however, must be excepted the six pastorals of Gay, entitled the *Shepherd's Week*, which are full of honest country humor, and contain charming pictures of English country life. Since the early part of the 18th c., however, pastoral poetry, strictly so called, has ceased to be cultivated in England and almost everywhere else. In the pages of Wordsworth, who lived all his days among the Cumberland shepherds, we indeed find many exquisite glimpses of pastoral life, as it presented itself to the profound and tender imagination of that great poet of nature, but few direct delineations of pastoral manners. Germany imitated abundantly the French and Italian models during the greater part of the 18th century. The last and best of the German series is the *Erwin and Elmire* of Goethe's youth. The general impression appears to be that the age of pastoral poetry has passed away forever, and that Damon and Chloe will never reappear in verse.

PASTORAL STAFF, sometimes also, although not properly, called crosier (q.v.) (Lat. *baculus pastoralis*), one of the insignia of the episcopal office, sometimes also borne by an abbot. It is a tall staff of metal, or of wood ornamented with metal, having, at least in the western church, the head curved in the form of a shepherd's crook, as a symbol of the pastoral office. The head of the pastoral staff of an archbishop, instead of the crook, has a double cross, from which its name of *crosier* is derived. In the Greek church the staff is much shorter, and the head is either a plain Greek cross or the form of the letter *Tau*, or it is a double-headed crook, which sometimes appears in the shape of the upsilon, *Υ*. It is difficult to determine the time at which the pastoral staff first came into use. The first distinct allusion to it is in St. Augustine's commentary on the 124th psalm. Gregory of Tours, in his life of St. Martin, mentions the pastoral staff of St. Severinus, who was bishop of Cologne in the end of the 4th century. From an early time the pastoral staff was connected with the actual possession of the jurisdiction which it symbolizes. The giving of it was one of the ceremonies of investiture; its withdrawal was part of the form of deprivation; its voluntary abandonment accompanied the act of resignation; its being broken was the most solemn form of degradation. So also the veiling of the crook of an abbot's pastoral staff, during the episcopal visitation, signified the temporary subjection of his authority to that of the bishop. An abbot being required to carry his pastoral staff with the crook turned inwards, showed that his authority was purely domestic. The pope alone does not use a pastoral staff. In the later mediæval period the material was often extremely costly, and, referring to the relaxation of the times, it was said "that formerly the church had wooden pastoral staves and golden bishops, but that now the staves are of gold and the bishops of wood." The workmanship was sometimes extremely beautiful. The Irish pastoral staff is of a type quite peculiar, and some of the sculptured specimens preserved in the British museum, at the royal Irish academy, and elsewhere, are very interesting as illustrating the ecclesiastical costume of the period.

PASTORAL THEOLOGY, that branch of theological science which regards the duties and obligations of pastors in relation to the care of souls. It comprises two parts; first, that which treats of the obligations of the pastors themselves, and which is therefore designed for the training and preparation of the candidates for the pastoral office. The other part of pastoral theology, which might perhaps better be called popular theology, comprises the objective teaching which is to be employed in the instruction and direction of the flock committed to the pastor's charge. This branch of theology has long formed a leading portion of the training of candidates in the evangelical churches of France and Germany. Numerous works on the subject represent the practice of the various sections

of the Protestant church; and more recently Catholic manuals of pastoral theology have appeared.

PASTRY, articles of food in which the chief part consists of a paste made of flour. This would of course apply to bread, but it has been limited by custom to such lighter articles as are made by the pastry-cook, and chiefly to those in which the paste is made to assume a light flaky character by the addition of butter, etc., and by the mode of working it up. The commonest kind is made of a dough of flour and water, into which butter or lard is worked by hand, in the proportion of six ounces to the pound. The finest kind is usually termed *puff paste,* and considerable skill is required to make it well, for it depends, next to the goodness of the materials, upon lightness of hand in kneading the ingredients together. These ingredients consist of fine wheaten flour and butter in the proportion of four ounces of butter to a pound of flour, with cold water just sufficient to make a good stiff elastic dough; this is rolled out with a *rolling-pin,* and double the previous quantity of butter is then spread over it. It is then rolled up and lightly kneaded, so as to work the butter in thoroughly. Coolness is very important in making pastry; a marble slab is therefore most desirable for making it upon. The thinner it is rolled out before the butter is then spread the better, because when it is put in the oven the laminæ which have been formed by folding or rolling up the butter with the dough, separate by the disengagement of the watery vapor, and the thinner and lighter the flakes are the better is the puff paste. Another kind is called *short paste;* in this the flour is made warm, and the butter or lard used is often melted, and a little sugar and an egg or two are added. This, when baked, has none of the flaky character of puff paste, but it is better adapted for meat and some other kinds of pies which require to be baked without a dish. Game pies, with elaborately-decorated crusts, are made of this pastry.

PASTURAGE, in English law called common of pasture, is classed among rights of common or profits *à prendre,* and is the right of one who is not the owner of land to put his sheep or cattle on such land to feed there. In Scotland it is called a servitude of pasturage. In both countries the right can be established by prescription, in England of thirty years, and in Scotland of forty years. Where the parties entitled to pasturage dispute as to their respective proportions of cattle, the suit to redress the matter is called in Scotland an action of "sowming and rowming."

PASTURES (Lat. *pasco,* to feed) are fields or tracts of land devoted to the feeding of oxen, sheep, and other herbivorous animals, which eat the grass and other herbage as it grows. Grass is grown sometimes in the rotation with grain and other crops, when it remains on the ground for one or more years, is frequently mown during the first summer, and grazed afterward, but is again plowed up to be succeeded usually by oats or wheat. For such purposes, rye-grass, red, white, yellow, and alsike clovers, are used either alone or mixed in varying proportions. On the uplands of Great Britain, wherever from any cause grain crops cannot profitably be grown, and throughout many of the richest plains and valleys, especially of England and Ireland, there are thousands of acres of land which have been under grass from time immemorial. Such permanent pastures are estimated to occupy fully 14,000,000 acres in England, nearly 8,000,000 in Scotland, and about 9,000,000 in Ireland. Sometimes they have been self-sown, occasionally they have been laid down with care, seldom are they as highly cultivated and liberally managed as they should be. The best of them are used for feeding heavy bullocks; those of somewhat poorer description are often grazed by dairy stock; while the down or upland pastures are especially profitable for sheep. It has now become a common practice, and is every year becoming more and more general, to give additional food of various kinds to animals fed on pastures. Even cattle grazing on the richest pastures are supplied with linseed cake, etc., to hasten the process of fattening, and to improve their quality; roots are given to sheep when fattening for the market, and hay to those which are to be kept as stock; whilst when oats or beans are cheap, many sheep-farmers find it advantageous to give them even to the hardy stock of exposed hill-pastures. All pastures are much improved by thorough drainage. The application of farmyard dung, soil, lime, and almost every sort of top-dressing is beneficial. Irrigation is sometimes profitable, and in some other countries is far more common and far more requisite than in Britain. Rich pastures on which oxen are fed are injured by sheep, which reject the coarsest grass, and pick out the finest; but a few horses turned into them during the autumn or winter help to consume the coarser tufts. The coarsest and rankest grass may once or twice a year be cut over by the scythe; and either made into rough hay, or if left on the ground, the cattle, when it has partially dried, will readily eat it up. A dressing of lime and salt scattered over the rougher parts of the fields in autumn will sweeten the herbage, and induce the stock to eat it down regularly. Moss, which is a great pest in many pastures, may be got rid of by penning sheep, well fed with swedes, cake, or corn, regularly over the field; or by harrowing the surface in several different directions during January or February, applying then a top-dressing of soil or dung, and in March or April sowing some clover or other seeds, which will be firmed down by the bush harrow, clod-crusher, or heavy roller. The droppings of the cattle ought to be broken up and scattered over the ground. Rich pastures intended for the fattening of cattle ought not to be used during winter, but allowed to become luxuriant before the cattle are turned upon them in spring. Very lean animals, whether

oxen or sheep, cannot with advantage be at once placed on very rich pasture, but must be gradually fitted for it. In some of the hill districts in Scotland, devoted to sheep farming, increased productiveness has resulted from breaking up portions of the pasture, and after two or three crops have been taken, laying them down as pastures again. All good pastures produce a very mixed herbage, not consisting merely of one kind of grass, but of several or many, with clovers and other plants. Different species of meadow-grass (*poa*), fescue (*festuca*), foxtail (*alopecurus*), oat-grass (*avena*), cock's-foot (*dactylis glomerata*), rye-grass (*lolium*), hair-grass (*aira*), vernal-grass (*anthoxanthum*), and timothy or cat's-tail (*phleum*), are among the most common grasses of British pastures. Yarrow (*achillæa millefolium*) is very abundant in some pastures, and is sometimes sown with grass, clover, etc., in land meant for permanent pasture. Different kinds of clover are adapted to different soils and situations. The presence of rushes is very indicative of the want of drainage. Thistles and docks are injurious, and are to be extirpated as much as possible. Some of the plants naturally abundant on high hill-pastures, as *nardus stricta* and *juncus bufonius*, are very unnutritious; and the substitution of others in their stead, is one of the benefits derived from the breaking up of such lands.

PATAGONIA, the most southern region of South America, extending from lat. 39° southward to the strait of Magellan, and occupying the extremity of the continent. Since 1881, nearly the whole country east of the watershed has been formally recognized as part of the Argentine Republic, while Chili, which previously claimed a considerable share of that area, has contented herself with the country to the west and a strip along the southern coast. Length upwards of 1000 m., greatest breadth about 480 m.; area about 235,000 sq.m.; pop. estimated with considerable doubt at about 20,000. The coast of the Atlantic has extensive bays and inlets, none of which, however, are of much importance or advantage, in a commercial point of view. Along the western coast, and stretching from 42° s. to the strait of Magellan, are numerous islands, with precipitous shores, belonging apparently to the system of the Cordilleras. The principal islands are Chiloé, the Chonos archipelago (q.v.), Wellington island, the archipelago of Madre de Dios, Queen Adelaide's archipelago, and Desolation island. These islands—which, together with several peninsulas, form a coast almost as rugged as that of Norway—are mountainous; but in none of them, except in Desolation island, do the mountains rise to the snow-line.

Surface, Soil, etc.—The country of Patagonia divides itself into two regions, very unequal in size and very different in character. These are eastern and western Patagonia, which are divided by the great mountain range of the Andes. Western Patagonia, comprising this range, the coast districts, and the islands, is rugged and mountainous. Opposite the island of Chiloé are two active volcanoes, one of which, Minchinmavida, is 8,000 ft. high. The slope of the country from the Andes to the Pacific is so steep, and the strip of shore so narrow, that the largest river of this district has its origin only about 13 m. from its embouchure on the coast. In the island of Chiloé, in the n. of western Patagonia, the mean temperature of winter is about 40°, that of summer rather above 50°; while at port Famine, in the extreme s. of this region, and 800 m. nearer antarctic latitudes than Chiloé, the mean temperature is not much lower, being in winter about 33°, and in summer about 50°. This unusually small difference in the mean temperature of the extremes of western Patagonia, which extends over about 14° of lat., is due to the great dampness of the atmosphere all along the coast. The prevailing winds of this region blow from the w.; and heavily surcharged with the moisture they have drawn from the immense wastes of the Pacific ocean, they strike against the Andes, are thoroughly condensed by the cold high mountains, and fall in rains that are almost perpetual from Chiloé to the strait of Magellan. South of 47° s. lat., hardly a day passes without a fall of rain, snow, or sleet. This continual dampness has produced forests of almost tropical luxuriance. A kind of deer wanders on the e. side of the mountains; guanacos, pumas, and water-fowl abound in the region between the Andes and the Atlantic; and along the coast, seals, otters, sea-elephants, fish, and shell-fish are found.

Eastern Patagonia comprises by far the larger portion of Patagonia, and extends eastward from the Andes to the Atlantic. Its surface has not yet been thoroughly explored, but the recent wanderings of Mr. Musters have at last furnished us with some authentic information. It mainly consists of high undulating plains or plateaus, frequently intersected by valleys and ravines, or rising into successive or isolated hills, which generally occupy the crest of the country. These plateaus are occasionally covered with coarse grass, but more frequently the surface is sterile, with a sparse vegetation of stunted bushes and round thistle clumps; and even these are sometimes wanting, absolutely nothing clothing the bare patches of clay or gravel; elsewhere it is strewn with huge round bowlders, and again rugged with confused heaps or ridges of bare, sharp-edged rocks, many of them of volcanic origin. Piercing blasts sweep almost incessantly from various points, but chiefly from the w. As this wind has parted with its moisture, hardly any rain falls in Argentine Republic during seven or eight months of the year. The descent from these plains or pampas to the valleys or more sheltered and fertile ground bordering the banks of the streams and rivers, is commonly termed "barranca," or bank, from the scarped slopes, varying in depth from 50 to 2 or 3 ft., and in angle from an easy to an almost perpendicular descent. The soil in many places is strongly impregnated with saltpeter, and salt-lakes and lagoons are numerous. North

of the Rio Chico, and towards the sea-coast, there is a wild, weird, desolate region called by the Indians "The Devil's Country;" it is said to be almost impassable. Several inhospitable wastes of this kind fringe the Atlantic, and have probably induced the belief that Patagonia is a barren and waterless desert; but the interior, though not fertile, really abounds in lagoons, springs, and streams, and the banks of the Rio Negro and even the Santa Cruz are capable of cultivation. Along the eastern base of the Andes, also, there is a great tract of territory which is astonishingly picturesque and fertile. Here great forests abound, to which the Indians retire for shelter from the freezing winds of winter. There are also deep valleys furrowed by mountain torrents; and numerous lakes, the haunts of wild-duck and other water-fowl. The largest of these lakes are Nahuel Huapi in the n., Coluguape in the middle, and Viedma in the south. Except pasture, eastern Patagonia has no productions. However fertile the soil in some places may be, it is nowhere cultivated. The Indians live upon the produce of the chase alone, and seem to desire no better sustenance. The principal rivers are the Rio Negro (q.v.); the Chupat, which flows through a good soil, producing excellent pasture and good firewood ; the Rio Deseado, probably rising in lake Coluguape ; and the Rio Chico, which flows out of lake Viedma, through a valley sometimes opening out into wide grass-covered plains dotted with incense bushes, and sometimes rising in huge, bare ridge and burrow-like undulations. All these rivers rise in the Andes, and flow e. or s.e. Herds of horses are reared, dogs abound, and, in the more favored regions, cattle are bred; pumas and foxes are met with, as well as condors, hawks, partridges, and water-fowl. But by far the most important animals are the guanaco or huanaca (q.v.); the rhea darwinii, called by the Patagonians *mekyush*, and by the Spaniards *avestrus* or ostrich; and the gama, a kind of deer.

Inhabitants.—The Patagonians have been hitherto described only in the most general terms, and in many cases very inaccurately. Little was known of their appearance, habits, and employments. The work of M. Guinnard, *Trois Ans d'Esclavage chez les Patagons* (1864) was for a time believed to form a valuable addition to our knowledge of Patagonia and its inhabitants; but the publication of Mr. Musters's record of his travels from the straits of Magellan to the Rio Negro, under the title of *At Home with the Patagonians* (1871), has utterly destroyed the Frenchman's claim to be an authority. Mr. Musters is decidedly of opinion that M. Guinnard was never in Patagonia at all, and that his "experiences" were confined to the Indians *north of the Rio Negro.*

The Patagonians or Tehuelche Indians are divided into two great tribes, the northern and the southern. They speak the same language, but are distinguishable by difference of accent; and the southern men appear to be on an average taller and finer, and are more expert hunters. The northern range chiefly over the district between the Cordillera and the Atlantic, from the Rio Negro to the Chupat, and even the Santa Cruz river. The southern occupy the rest of Patagonia as far south as the strait of Magellan. The two divisions, however, are much intermixed, and frequently intermarry. The question is often asked: "Are the Patagonians of gigantic stature?" Mr. Musters's statement is: "The average height of the Tehuelche male members of our party with which I traveled was rather over than under 5 ft. 10 inches." Two others, measured carefully by Mr. Clarke (while resident at Santa Cruz), stood 6 ft. 4 in. each. The muscular development of the arms and chest is extraordinary, and in general, the Patagonians are well proportioned. They are splendid swimmers, can walk great distances without being tired, and can go for two and even three days without being tired. As an illustration of their strength of arm, Musters mentions that he has seen them "ball" an ostrich over 70 yards distant. The expression of their face is ordinarily good-humored, except in the settlements: their eyes are bright and intelligent, their noses aquiline and well-formed, their foreheads open and prominent. The complexion of the men, when cleansed from paint, is a reddish brown. Thick flowing masses of long hair cover their heads, and are combed out by their wives at least once a day. The scanty natural growth of beard, mustaches, and even eyebrows, is carefully eradicated. The young women are frequently good-looking, displaying healthy, ruddy cheeks when not disguised with paint. The dress of the men consists of a *chiripa* or undergarment round the loins, made of a poncho, a piece of cloth, or other material; a long mantle of hide, worn with the fur inside, and drooping in unbroken outline from their shoulders to the ground; and potro boots or buskins made from the skin of horse's hock, and occasionally from the leg of a large puma. The dress of the women is similar, except that the undergarment is made of calico or stuff sack, and extends from the shoulders to the ankle. Both sexes are fond of ornaments, wearing huge ear-rings of square shape, suspended from small rings passing through the lobe of the ear; also silver or blue bead necklaces. The reason assigned for the use of paint is that it forms a protection against sun and wind, and Musters states that he "found from personal experience it proved a complete preservative from excoriation or a chapped skin."

The arms of the Tehuelches consist of gun or revolver; sword or dagger; a long, heavy lance, used only by dismounted Indians, and altogether different from the light lance of Araucanian and Pampa horsemen; and the *bola perdida*, or single ball, so called because, once thrown from the sling, it is not picked up again.

Their houses, called *toldos*, are formed of three rows of stakes driven into the ground. The middle row is higher than the others, and the three rows are tied together with

strings of hide, and so kept in their place. This frail framework is covered with hides which reach the ground on all sides, and are fastened to it by small stakes of bone. At night-fall, guanaco hides are spread on the ground within the tents, and the men and women, laying aside their mantle, their only garment, and which sometimes serves as a blanket, go to sleep under the same roof and in the same apartment. Bathing in cold water every morning, throughout the whole year, is a custom to which men, women, and children conform; and although the morning bath may not free them from vermin —a national characteristic—yet it has the effect of preventing disease, and of enabling them the more easily to endure the severities of winter. Their only manufactures are mantles of guanaco hide, and saddles, bridles, stirrups, and lassos. The lassos and the articles of harness are chiefly plaited, and evince wonderful ingenuity and nicety of execution.

The religion of the Patagonians (according to Mr. Musters) is distinguished from that of the Pampas and Araucanians by an absence of any trace of sun-worship. They believe in a great and good spirit who created the Indians and animals, and who dispersed them from a place which they call "God's hill;" but Mr. Musters is inclined to think that this belief owes its origin to a confused apprehension of the story of creation as told by the Christian missionaries. Curiously enough, this great and good spirit takes no concern with the beings whom he has created. Idols are unknown, and during the whole of his wanderings Mr. Musters saw no trace of any periodic religious festival. Whatever religious acts the natives performed were prompted by their dread of malicious demons, the chief of whom, Gualichu, is always on the watch to cause mischief. To propitiate or drive away this spirit is the function of the wizard, doctor, or medicine-man, who (as in other countries) combines the medical and magical arts. The Gualichu lurks outside the *toldos*. He is invisible (except to the "doctor," who has the gift of second-sight), and he can enter into the bodies of people, and cause sickness and disease of every sort. Besides the Gualichu, there are, as has been said, many other evil spirits, who are supposed to inhabit subterranean dwellings, underneath certain woods and rivers and peculiarly shaped rocks, all of whom are saluted on occasion with special incantations. The cry of the nightjar on the Cordillera betokens sickness or death; a certain toad-like lizard mysteriously lames horses; a fabulous two-headed guanaco is a sure forerunner of epidemic disease, etc. To counteract the influence of these, charms and talismans are liberally employed.

Their language is quite different from either Pampa or Araucanian. "Though able to converse in Tehuelche," says Mr. Musters, "I could not at all understand the Pampas; and this is noted with reference to statements made in M. Guinnard's work, which, coupled with other internal evidences . . . . compel me to doubt that the author was ever in the hands of the real Patagonians." The same writer has a more favorable opinion of their character than is common. He found them "kindly, good-tempered, impulsive children of nature, taking great likes or dislikes, becoming firm friends or equally confirmed enemies." They are, however, "steadily and rapidly decreasing," through the combined effect of disease and bad liquor supplied to them by traders at the stations; and before long the race will be extirpated. The oldest of these stations is Patagones (formerly El Carmen), on the north side of the Rio Negro, about 18 m. from its mouth, in the Argentine country. It has a pop. of about 2,000, composed of Spanish and other settlers, negroes, and convicts from Buenos Ayres At the mouth of the Chupat there was from 1865 till 1870 an unprosperous Welsh colony; at the mouth of the Santa Cruz, further s., there is also a petty station; and at Punta Arenas (Sandy Point), on the strait of Magellan, the Chilian government have established a colony and a penal settlement.

See *At Home with the Patagonians: a Year's Wanderings over the Untrodden Ground from the Straits of Magellan to the Rio Negro*, by George Chaworth Musters (Lond. 1871); and *Across Patagonia*, by Lady Dixie (1880). See also works by Beerbohm and Coan.

PÂTÂLA (from *pat*, fall) is, in Hindu mythology, the name of those inferior regions which have seven, or, according to some, eight divisions, each extending downwards 10,000 *yojanas*, or miles. The soil of these regions, as the *Vishnu-Purâna* relates, is severally white, black, purple, yellow, sandy, stony, and of gold; they are embellished with magnificent palaces, in which dwell numerous dânavas, daityas, yakshas, and great snake-gods, decorated with brilliant jewels, and happy in the enjoyment of delicious viands and strong wines. There are in these regions beautiful groves, and streams and lakes, where the lotus blows, and the skies are resonant with the kokila's songs. They are, in short, so delightful, that the saint Narada, after his return from them to heaven, declared among the celestials that Pâtâla was much more delightful than Indra's heaven. Prof. Wilson, in his *Vishnu-Purâna*, says "that there is no very copious description of Pâtâla in any of the *Purânas;* that the most circumstantial are those of the *Vâyu* and *Bhâgavata Purânas;* and that the *Mahâbhârata* and these two *Purânas* assign different divisions to the dânavas, daityas, and nâgas. . . . The regions of the Pâtâla and their inhabitants are oftener the subjects of profane than of sacred fiction, in consequence of the frequent intercourse between mortal heroes and the serpent-maids. A considerable section of the *Vrihat-Kathâ* consists of adventures and events in this subterraneous world." For inferior regions of a different description, see NARAKA.

PATANJALI is the name of two celebrated authors of ancient India, who are generally looked upon as the same personage, but apparently for no other reason than that they bear the same name. The one is the author of the system of philosophy called Yoga (q.v.), the other the great critic of Kâtyâyana (q.v.) and Pânini (q.v.). Of the former, nothing is known beyond his work—for which see the article YOGA. The few historical facts relating to the latter, as at present ascertained, may be gathered from his great work, the *Mahâbhâshya*, or "the great commentary."

PATAP'SCO, a river of Maryland, rises on the northern boundary of the state, and flows south-easterly 80 m. to the Chesapeake bay, 14 m. s. of Baltimore, to which city it is navigable. Its falls furnish water-power to numerous factories.

PATARENES, or PATERENES, a name given in the 11th c. to the extreme opponents of clerical marriages. The party was led by Arialdus, a deacon of Milan, where its members used to meet in the Pataria, or ragman's quarter, *pates* being a provincial name for a rag. Early in the 13th c. the title, from an erroneous idea that it came from the word *pati*, to suffer, was appropriated by the Cathari, who condemned marriage altogether.

PATCH, SAMUEL (1807–1829), was born in Rhode Island, but little is known of his early life, except that he went to sea when very young. After a few years he returned and settled in Paterson, N. J., where he learned the trade of cotton spinning. Much was being said at this time about jumping, and he became possessed with a desire to jump from a bridge recently built over the Passaic at that point. It was a distance of about ninety feet, and the leap was considered so dangerous that he was finally placed under arrest; but a few months later he performed the feat successfully. This was in 1827, and it gave him such wide-spread popularity that he left his trade and traveled about giving exhibitions of his skill by leaping from the yard-arms or top-masts of ships. In the course of these exhibitions he made a trial in Rochester, N. Y., that he considered a partial failure, so he advertised that he would make another trial there, in which he would jump from the bank of Genesee river into the depths just below the falls, a distance of 125 feet. While waiting the day for this performance he went to Niagara and jumped from a projecting rock on Goat Island, a distance of nearly a hundred feet. At the appointed time, November 13, 1829, he made the leap into the Genesee river, but he never rose to the surface, and nothing was seen of his body for many months. It was finally found, and was buried at Charlotte, near the mouth of the Genesee river.

PATCHOGUE' a village and port of entry in Suffolk co., Long Island, N. Y., on the shore of Great South bay, and the Long Island railroad; 54 miles e. of New York. It has a public library, union school, Latin school, electric lights, state and savings banks, Holly system of waterworks, large oyster and fish interests, and manufactories of lace curtains, paper, and brass goods. It was incorporated in 1893. Pop. '90, not reported.

PATCHOU'LI. This very interesting material is the dried branches of *pogostemon patchouli* (natural order *labiatæ*), which was first introduced to this country as an article of merchandise in 1844. The plant is a native of Silhet, the Malay coast, Ceylon, Java, the neighborhood of Bombay, and probably also of China; but owing to the fondness of Asiatics for the perfume which it yields, it is difficult to say where it is native or cultivated. Every part of the plant is odoriferous, but the younger portions of the branches with the leaves are chosen; they are usually about a foot long. The odor is peculiar and difficult to define, but it has a slight resemblance to sandal-wood; it is very powerful, and to many persons is extremely disagreeable. The odor of patchouli was known in Europe before the material itself was introduced, in consequence of its use in Cashmere to scent the shawls with a view of keeping out moths, which are averse to it; hence the genuine Cashmere shawls were known by their scent until the French found the secret, and imported the herb for use in the same way. Its name in India is *pucha-pat*, and it is there used as an ingredient in fancy tobaccos, and as a perfume for the hair. It is also much prized for keeping insects from linen and woolen articles. The essence of patchouli is a peculiar heavy brown oil, with a disagreeably powerful odor; it is obtained by distillation, and requires extreme dilution for perfumery purposes.

PÂTÉ DE FOIE GRAS, sometimes called Strasburg pie, a dish greatly esteemed by epicures, and, as the name indicates, made of the livers of abnormally fattened geese or ducks. Strasburg and Toulouse are the chief places of manufacture, the *pâtés* are exported to every part of the world, and the trade amounts to several hundred thousand dollars annually. The fowls are fed to repletion with salted maize, and by this means the liver is increased to the unnatural weight of 2 or even 3 lbs.

PATEL'LA, or KNEE-CAP, is a sesamoid bone (q.v.), developed in the single tendon of the *rectus, vastus externus,* and *vastus internus* muscles—the greater extensor muscles of the leg. It is heart-shaped in form, the broad end being directed upwards and the apex downwards. The anterior or external surface is convex, perforated by small apertures for the entrance of vessels, and marked by rough longitudinal striæ, while the posterior or internal surface is smooth and divided into two facets by a vertical ridge, which corresponds and fits into the groove on the lower articulating surface of the femur or thigh-

bone, while the two facets (of which the outer is the broader and deeper) corresponds to the articular surface of the two condyles.

This bone is liable both to dislocation and fracture. Dislocation may occur either inwards or outwards; but it is most frequent in the outward direction. The displacement may be caused either by mechanical violence, or by too sudden contraction of the extensor muscles in whose conjoined tendon it lies; and is most liable to occur in knock-kneed, flabby persons. It may be readily detected by the impossibility of bending the knee, and by the bone being felt in its new position, and, except in one rare variety, the dislocation is capable of being reduced without any difficulty. Fracture of the patella may (like dislocation) be caused either by muscular action or by mechanical violence.

Fracture by muscular action is the more common of the two forms, and occurs thus: A person in danger of falling forwards attempts to recover himself by throwing the body backwards, and the violent action of the extensors (chiefly the *rectus*) snaps the patella across, the upper fragment being drawn up the thigh, while the lower portion is retained *in situ* by that portion of the common tendon which is continued from the patella to the tubercle of the tibia, and which is called the ligamentum patellæ. The treatment consists in relaxing the opposing muscles by raising the trunk, and slightly elevating the limb, which should be kept in a straight position. In consequence of the great difficulty of bringing the broken surfaces into exact apposition, it is very difficult to obtain bony reunion of the parts, and the case generally results either in mere ligamentous union or in no true union at all.

PATELLA and **PATELLIDÆ.** See LIMPET.

PA'TEN (Lat. *patina*, a dish), the plate employed for the elements of bread in the eucharistic service. Anciently it was of considerable size; and while the practice of the offertory (q.v.) continued, there was a special paten for the bread-offering. In the Roman Catholic church, in which the unleavened wafer-bread is used, and the communion is distributed from a distinct vessel called pyx (q.v.), the paten is a small circular plate, always of the same material with the chalice. It is often richly chased or carved, and studded with precious stones. It is used only in the mass.

PATENT, an exclusive right granted by an official document and securing to a person for a term of years the exclusive privilege of making, using, and selling something invented by him. The protection given covers new and useful arts, by which results are obtained in a cheaper, easier, or more advantageous manner; machines, or improvements thereof; manufactures, in the sense of essentially new fabrics or products, and designs connected with such manufactures; and compositions which result from new combinations of ingredients already in use. The articles newly discovered or invented must not have been surrendered to the public openly or by implication, and improvements must not have been patented or described in any printed publication, or sold to or used by the public for more than two years previous to the application of the patentee. It is often the case that the most useful inventions bring but little pecuniary gain to the discoverer, and, again, that from some very simple modification of an article large profits will occur.

Patents are issued in the name of the United States, and under the seal of the Patent Office, to any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use, or on sale for more than two years prior to his application, unless the same is proved to have been abandoned; and by any person who, by his own industry, genius, efforts, and expense has invented and produced any new and original design for a manufacture, bust, statue, alto-relievo, or bas-relief; any new and original design for the printing of woolen, silk, cotton, or other fabrics; any new and original impression, ornament, pattern, print, or picture to be printed, painted, cast or otherwise placed on or worked into any article of manufacture; or any new, useful, and original shape or configuration of any article of manufacture, the same not having been known nor used by others before his invention or production thereof, nor patented nor described in any printed publication, upon payment of the fees required by law and other due proceedings had.

Every patent contains a grant to the patentee, his heirs or assigns, for the term of seventeen years, of the exclusive right to make, use, and vend the invention or discovery throughout the United States and the Territories, referring to the specification for the particulars thereof.

If it appear that the inventor, at the time of making his application, believed himself to be the first inventor or discoverer, a patent will not be refused on account of the invention or discovery, or any part thereof, having been known or used in any foreign country before his invention or discovery thereof, if it had not been before patented or described in any printed publication.

Joint inventors are entitled to a joint patent; neither can claim one separately. Independent inventors of distinct and independent improvements in the same machine cannot obtain a joint patent for their separate inventions.

PATENT OFFICE. The business of the United States Patent Office previous to 1836 was conducted by a single clerk in the office of the secretary of state. The act of 1836 provided for the appointment of 4 clerks, one to act as examiner, and also of a draughts-

man, machinist, and messenger. Provision was also made for the establishment of a library. From this slender beginning has grown the immense establishment now occupying nearly the whole of the building of the department of the interior at Washington, and employing between four and five hundred persons. The Patent Office, as the building is usually called, is of marble, freestone, and granite; 453 ft. long, 331 ft. wide, and 75 ft. high, in Doric architecture. The model rooms occupy the upper story, and consist of 4 halls, 1350 ft. in length, and containing more than 200,000 models of patents. The capacity of the building is now taxed to its utmost, and it is thought by many that models have been required in many cases where drawings would answer the purpose. A recent rule of the office provides that applicants need not furnish models unless officially notified to do so. The model rooms are open to the public. Below are the offices of the commissioner, his assistant, and about 70 examiners divided into several classes. In the ten years ending Jan. 1, 1850, 5,941 patents were issued; from 1850 to 1860, 21,428; from 1860 to 1870, 77,315; from 1870 to 1880, 140,375. The ratio of this increase to that of the increase of pop. is sixfold. As compared with foreign nations the amount of business done in the Washington office is the largest in the world. The charge for application for a patent is $20 in the United States, against $50 in Canada, $75 in England, $100 in most continental countries, $300 in Russia and most British colonies, and $400 in Portugal and British India. These fees are for the application only, and subsequent fees are in proportion. In the year ending June 30, 1880, the number of patents issued was 12,471 (1629 less than in 1879); of trade marks, 1141; and of labels, 403. The total expenditure of the office was $548,651.47, and the receipts $703,146.79. By authority of congress the office issues weekly a *Gazette*, containing lists of the patents issued, description, and specifications of the more important, with engravings, notice of new rules adopted, and accounts of patent litigation, and decisions of the U. S. courts. The department also issues a pamphlet entitled *How to Obtain Patents*, sent free on application, which contains minute direction as to the course to be taken by inventors. We add a schedule of the present patent fees of the United States: On filing application, $15; on issuing original patent (17 years), $20; on application for re-issue, $30; on application for extension, $50; on granting extension of patent (7 years), $50; on each caveat, $10; on appeal to examiners-in-chief, $10; on appeal to commissioner of patents, $20; on filing a disclaimer, $10; on application for design (3½ years), $10; on application for design (7 years), $15; on application for design (14 years), $30; on each trade mark (30 years), $25; on each label (28 years), $6.

The receipts of the Patent Office during the fiscal year 1889–90 were $1,347,203, and expenditures, $1,081,174. Receipts over expenditures, $266,029.

The following is a statement of the business of the office for the fiscal year ending June 30, 1890:

Number of applications for patents	40,201	Number of patents granted, including reissues and designs	25,857
Number of applications for design patents	1,003	Number of trade-marks registered	1,332
Number of applications for reissue patents	121	Number of labels registered	304
Number of applications for registration of trade-marks	1,617		
Number of applications for registration of labels	868	Total	27,493
Number of caveats filed	2,330	Number of patents withheld for non-payment of final fees	3,403
Total	46,140	Number of patents expired	11,885

The total number of applications filed at the Patent Office, in fifty-four years, 1837–90, was 742,583; number of caveats filed, 91,165; number of patents issued, 475,785. Receipts, $25,349,584; expenditures, $20,354,110. Net surplus, $4,995,474.

PATENTS, LAW OF (see PATENT; PATENT OFFICE), though originally used to include the alleged authority for granting monopolies and the law of copyright, is now confined to the granting by the sovereign power in the state of certain immunities, privileges, and authority as to the making, use, and sale of useful articles newly discovered or invented and not already openly or by implication surrendered to the public; or as to the employment of some newly discovered process in art or manufactures. The privileges are continued for a limited time. To the inventor the consideration is the profit to be derived from the sale or use of the invention; to the public the consideration is, first, the stimulation of invention; secondly, the free public use of the invented article after the limited time expires. It is noticeable that the first patent granted in this country, 1641, was for a new *process*, that of making salt. Several others were granted before the revolution, under the royal charter, or by the authority of colonial statutes, the most important instances occurring in Connecticut and Massachusetts. By the U. S. constitution power was conferred upon congress to pass statutes "securing for limited times to authors and inventors the exclusive right of their respective writings or discoveries." The first statute was that of 1790. This fixed the limit at 14 years, or less, at the discretion of the grantors, who were to be the attorney-general and the secretaries of state and of war. The approval of any two of these sufficed. A foreigner could receive a patent. Fees were fixed; infringers were made liable to punishment, but no provision was made for the examination of the claims. The act was found deficient, and in 1793 a second was passed which introduced the principle of deciding interfering claims and made the form of petition to the secretary of state alone. Triple damages were to be paid by infringers; the fee was fixed at $30, and a method was provided for bringing disputed claims before a U. S. district court. The act of 1800 compelled the applicant to make oath that the invention had not been previously known or used in this or *any foreign*

country. These and other acts and amendments, in 1819 and 1832, were rendered void by the act of 1836, which, though changed in many points by subsequent statutes (1837, '39, '42, '48, '49, '52, '60, '61, '70, '72), forms the basis of our present regulations. This statute had for its marked features the establishment of a separate office (see PATENT OFFICE), the appointment of a commissioner as its head officer, and of another officer to examine the patentability of claims, and the introduction of the system of *caveats*. The fee to foreigners (except aliens resident here one year) was $500 if subjects of Great Britain; to others $300. A board was appointed to which appeal could be made from the decisions of the commissioner and examiner. The power of extending the patent for 7 years, after the expiration of the 14 was granted to a board of three commissioners. Reference must be made to the statutes for the details of changes made by later acts. Among the more important were: that of 1839, providing that an "abandonment" to the public must have taken place two years before the application for the patent, to justify refusal of the grant; that of 1848, extending the powers of the commissioner; of 1849, transferring the office from the department of state to that of the interior; of 1861, extending the term from 14 to 17 years, withdrawing the power of extension from the commissioner, removing the distinction between U. S. citizens, and those of nations not discriminating against this country in the matter, fixing the fees at $15 on application and $20 on issue of the patent, and establishing a "board of examiners-in-chief," to whom there is an appeal from the decisions of the primary examiner. The act of 1870 differed from the then existing statutes only in unimportant particulars. Under the present law patents are granted to aliens as well as to citizens, the only requirement being that the invention shall be original; and to this rule the exception exists that as against a previous knowledge or use in other countries it is necessary for the applicant to show only that he believed himself to be the original discoverer at the time of application. Executors and administrators of a deceased inventor may receive the patent, and the grant may issue to two or more jointly. An extension for 7 years may be obtained on paying an application fee of $50, and the same sum on issue. In applying for a patent a specification must be presented describing the nature and principle of operation of the invention, with a detailed account of the relation of the different parts, and a distinct statement of what is claimed as new. This must be signed and attested by two witnesses, and accompanied by a sworn statement of the applicant's *bona fide* belief of the originality of his invention. Wherever possible, a model, not to exceed a foot in the length of any dimension, must be furnished; and in case of a composition of matter, samples of the ingredients and specimens of the composition should be forwarded. The application is by petition to the commissioner of patents; by him it is referred to one of a number of primary examiners, each having charge of a special class of inventions. On the approval of such examiner the patent is granted; if adverse cause be found, an opportunity is given the applicant to remove the objection by explanation or proof. If unsuccessful he may appeal to the three examiners-in-chief; from this board he may again appeal to the commissioner, whose decision is final, unless reversed by the supreme court of the district of Columbia. A *caveat* is a paper filed by an inventor, briefly stating the nature of his intended claims, and accompanied by a fee of $10. Its effect is to secure the applicant for one year from the granting of any patent interfering with his claim, and thus allow him time to mature his invention. The *caveat* may be renewed from year to year. If application for an interfering patent be made, notice is given to the filer of the *caveat*, and he must then within three months make the regular application. The question of priority of invention is then tried as in other cases; and in all, appeal lies to the district supreme court. A *re-issue* is granted on the surrender of the old grant and a request to amend it in certain specified points; new claims cannot be introduced into the re-issue; the amendment must be for mistakes or errors by which the original intent of the grant was rendered void or incompletely carried out. No extension beyond the term of 17 years is now allowed. Patents are granted for designs, artistic, ornamental, or connected with manufactures. The question of *trade marks* (q.v.) was formerly closely connected with the patenting of designs. The patent takes effect from the day of issue.

What *subjects-matter* are properly within the domain of patent law and what is necessary to constitute a patentable invention or discovery, are important questions. As to the first the language of the statute provides for the granting of patents to the inventor "of any new and useful *art, machine, manufacture,* or *composition of matter,* or any new and useful improvement thereof." The term manufacture is construed in a more limited sense than in the patent laws of most foreign countries, as it is used exclusive of machinery and compositions. Under the head of "art" are included all patentable processes, or methods. It is often difficult to tell within which classification a specified invention properly falls, but it is sufficient that its nature is such as to bring it within the limits of one or more of the four classes. Every discovery does not entitle the discoverer to an invention. Thus a mere enunciation of a scientific theory, abstract principle, or philosophical truth, is not patentable. But if such principle be so reduced to a practicable and tangible form, so as to be a concrete construction of component parts, or structure capable of producing useful results, this will be patentable. It is not necessary that all parts of the invention be new, but what is new must produce some tangible useful effect or improvement. Where two or more existing processes or parts of machinery are for the first time united, if a new effect be produced, the combination is patentable, other-

wise not. No invention injurious to public morality, or which would assist crime, can be patented. But an invention of a process or tool which would be useful in legitimate business cannot be rejected on the ground that it might also be of aid to burglars or counterfeiters. That which is useful is also to be distinguished from that which is trivial or frivolous, but a glance at the patent office models will quickly dispel any fear that undue severity is exercised on this point. "Double use" is not patentable, that is, a new use of a process or machine already in use for a different purpose, is not considered a new invention. A mere substitution of one substance or element (or, in a process, of a chemical ingredient) will not be considered, if the two have the same function only. A patentable *process* is one which by the application of some principle or natural law, such as the application of one form of matter to another, or by chemical action, produces some new and useful effect. Important instances are the patented processes used in manufacturing vulcanized india-rubber, in smelting ores, and in making high grades of steel. An abandonment by an inventor may be inferred from his neglecting to make objection to the use of his invention by unauthorized parties within his knowledge, or from unreasonable delay in making application after the completion of the invention. If the latter be in public use for two years before the time of application the inventor's claim is absolutely forfeited. To constitute such public use it is necessary to show only a single instance. When a patent has been granted and application is made by a second person, claiming priority of invention, it is too late for the "interference" investigation by the patent office, and the only course for the commissioner to pursue is to grant a second patent to the applicant, if he feel warranted by the facts, and thus leave the parties to contest their rights on an equal footing in the courts.

Patents are the subject of sale in whole or in part, and may be mortgaged or assigned. Such assignment must be recorded at the patent office to protect the assignee against a vendee or mortgagee claiming through the original patentee. Licenses to use an invention may be written or oral, but cannot be assigned to a third party without special authority. A contract to sell or assign an invention not yet patented is a good executory contract, but actual sale or assignment is null. To constitute infringement of a patent there must be the making, use, or sale to another of that which is the subject matter of an existing patent. The test is whether the two are not substantially identical. Changes in form, relative position, or substitution of one material for another, will not save an infringer from the penalties attached to infringement. Damages may be recovered by the patentee in an action on the case in courts of common law, or by equity proceedings. In the former method the measure of damage is the actual damage incurred; in the latter the infringer may be compelled to account for the profits received by him, and a temporary or permanent injunction may be obtained. Notice must be given of the patentee's right by marking the article with the word "patented" and the date of issue. Penalties are provided for the wrongful use of such mark or stamp. The best work on patents in this country is that of George Ticknor Curtis; Phillips and Fessenden are also standard authors. The latest English work is that of Agnew.

PATER, Walter Horatio, was b. in London, August 4, 1839. He was educated at the King's school, Canterbury, and in 1858 entered Queen's college, Oxford, where he graduated B.A. in 1862. He was elected to a fellowship at Brasenose College, and after filling various offices in this institution, took the degree of M.A. in 1865. Mr. Pater traveled extensively in Italy, France, and Germany. In 1866 he made his first contribution to literature in the form of an essay on the writings of Coleridge, which appeared in the January number of the *Westminster Review*. In 1873 he published in *Macmillan's Magazine* a series of studies in art and literature entitled *The Renaissance*, of which a second edition appeared in 1877; *Marius, the Epicurean: His Sensations and Ideas*, in two volumes, appeared in 1885. This work reached its second edition for both England and America. Mr. Pater also contributed extensively both to the *Fortnightly Review* and *Macmillan's Magazine*. Among these contributions may be mentioned *Wordsworth; The School of Giorgione Dionysius; Charles Lamb; The Beginnings of Greek Sculpture*, in the former; *A Prince of Court Painters; Sebastian Van Storck*, and others, in the latter. He was the contributor to Ward's *English Poets* of the sketches on Coleridge and Rossetti. His last work was *Plato and Platonism* (1893). He d. in 1894.

PATER'CULUS, G. Velleius, a Roman historian, descended from an ancient and wealthy Campanian family, is thought to have been b. about 19 B.C. He entered the army at an early age, and from 4 to 12 A.D. served under Tiberius as prefect or legate in Germany, Pannonia, and Dalmatia. He was a great favorite with Tiberius, and when the latter became emperor, 14 A.D., Paterculus was appointed pretor. He was alive in 30 A.D., as his history comes down to that year; but it is conjectured that in the following year he was probably put to death as one of the friends of Sejanus, of whom he speaks highly in his work. Paterculus's claim to remembrance is his *Historiæ Romanæ*, a compendium of universal, but more particularly of Roman history, in two books. The work, as we have it, is not complete; the beginning, and a portion following the 8th chapter, being wanting. It seems to have commenced with the fall of Troy; and describes only the most prominent historical incidents, but these, fortunately, with considerable fullness of detail. Scholars are satisfied that it is a work of a man who is, on the whole, impartial and discriminating. The style is based on that of Sallust. The *editio princeps* of the *Historiæ Romanæ* appeared at Basel in 1520; the most valuable is

Ruhnken's, on account of its excellent notes (Lugd. Bat. 1789), reprinted by Frotscher (Leips. 1830-39); but Orelli's (Leips. 1835) has the least corrupt text.

PA'TERNOSTER (Lat. "Our Father") called also THE LORD'S PRAYER, a short form of prayer suggested or prescribed by our Lord to his disciples (Matt. vi. 9-13, Luke xi. 1-4) as the model according to which, in contrast with the prayers of the Pharisees, their petitions ought to be composed. The paternoster has been accepted as, by excellence, the form of Christian prayer. It formed part of all the ancient liturgies. So sacred, indeed, was its use, that it was reserved from pagans and catechumens under what is known as the discipline of the secret. The early fathers—Origen, Tertullian, Cyprian—refer to it in terms which show that even then it was a recognized form of private prayer. It was recited in baptism, and one of the privileges of the baptized was the use of the paternoster. More than one of the fathers, and very many later writers, have devoted special treatises to the exposition of this prayer, as embracing all the fitting and legitimate objects of the prayer of a Christian. The catechism of the council of Trent contains a detailed exposition and commentary of it, and in all the services, not only of the Roman missal, breviary, ritual, processional, and ordinal, but in all the occasional services prescribed from time to time, it is invariably introduced. In the rosary (q.v.) of the Virgin Mary, it is combined with the hail Mary (whence the larger beads of the "rosary" are sometimes called *paternosters*), and perhaps the most usual of the shorter devotions among Roman Catholics is the recitation of the "pater," with one or more "Ave Marias," concluding with the doxology. The paternoster as commonly used by Protestants concludes with the clause, "for thine is the kingdom, and the power, and the glory for ever. Amen." This clause is not used by Roman Catholics. Of the two gospels—that of Matthew and that of Luke—in which the prayer is contained, that of Luke has not this clause; and even in the gospel of Matthew it is found only in the later MSS., in which it cannot be doubted that it is a modern interpolation. It was retained, however, in Luther's German translation, and in the authorized version, whence its use became common among Protestants. Many polyglot collections of the paternoster have been published from the 16th c. downwards, the most remarkable of which are those of John Chamberlayne in 150 languages (1715), of Conrad Gesner in 200 (1748), and that of Padre Hervaz in 307 (1787).

PATERSON, city and co. seat of Passaic co., N. J.; on the Passaic river, the Morris canal, and the New York, Lake Erie, and Western, the New York, Susquehanna, and Western, and the Delaware, Lackawanna, and Western railroads; 16 miles n.w. of New York. It was founded in 1791 for a great manufacturing center; was incorporated as a city in 1851; and is widely known as the Lyons of America. The greater part of the city lies in a curve of the river, which has a perpendicular fall of 50 ft. at this point, supplying a great water power, and a decline of 20 ft. more to the plain. The manufactures, which make this the third city in the state in importance, include silk and silk goods, jute, paper, iron and steel, locomotives, machinery, engines, boilers, linen thread, malt liquors, etc. The U. S. census of 1890 reported 599 manufacturing establishments, which employed $27,603,549 capital and 24,232 persons, paid $11,578,082 for wages and $22,480,727 for materials, and had an output valued at $42,263,531. The silk factories are the most important in the U. S., employing over 11,500 persons, and producing goods valued at more than $22,000,000. The city has East and West side parks, a soldiers' monument, public library, county buildings, opera house, high school and many grammar schools, about 50 churches, hospitals, asylums, national and savings banks, and daily and weekly newspapers. The streets are broad, well paved and drained; there are several lines of electric street railroad, and efficient police and fire departments. The water supply is drawn from the Passaic. Pop. '90, 78,347.

PATERSON, WILLIAM, the most celebrated, after John Law (q.v.), of the commercial schemers of the 17th c., was, like Law, a Scotchman, and was b. in the parish of Tinwald, Dumfriesshire, in 1658. His early career is obscure, but before he was 30 he was a merchant, carrying on considerable transactions with the West Indies and other countries. It was he who first projected the bank of England (incorporated in 1694), and he was one of the original directors. He is best known, however, in connection with the famous Darien scheme, of which he was the prime mover, and which obtained the royal sanction in 1695. This project came to ruin in a few years; but the scheming activity of Paterson continued unabated. When, in 1701, William resolved to carry the contest with Louis XIV. into the heart of Spanish America, Paterson was taken into the king's confidence, and, but for that monarch's death, might have seen his dreams of Darien realized. He had a considerable hand in the union of Scotland with England. He d. 1719.

PATHOLOG'ICAL ANATOMY, or the anatomy of diseased organs, is included in, but must not be confounded with pathology, as until comparatively lately was often the case. It is merely a section—although a most important section—of pathology, contributing (as Prof. Vogel has well remarked "to practical medicine the solid materials from which to construct a basement, without having the power to erect a perfect edifice." Pathological anatomy enables the surgeon to decide whether a suspicious tumor is malignant or of a comparatively harmless nature, and in many other ways is of the greatest importance to surgery; and although at first sight it might appear to be of small importance in relation to therapeutics, this is not in reality the case. Scientific treatment

necessarily demands an accurate knowledge of the material changes which lie at the foundation of the various morbid symptoms. Hence pathological anatomy not only forms a portion of the positive basis of therapeutics, but it also points out the processes by which the different altered parts may be gradually restored to their normal condition. It not merely indicates what requires healing, but in many cases also the course that must be adopted in order to aid the curative tendency of nature. It likewise serves as a check on therapeutics, exposing, in a most conclusive manner, the absurdity of many pretended methods of cure. It points out, for example, that in a certain stage of inflammation of the lungs (pneumonia) a fibrinous fluid separates from the blood, and by its coagulation renders a portion of the tissue of the lung impermeable to air; and further that it requires several days for this coagulated matter to resume the fluid condition and to be removed. If any one should assert—and such assertions have often been made—that in this stage of the disease he could apply a remedy which would cure the patient in a few hours, a very slight knowledge of pathological anatomy would show the folly of such an assertion. The best English works on this subject are Vogel's *Pathological Anatomy of the Human Body*, and Jones and Sieveking's *Manual of Pathological Anatomy*.

PATHOLOGY (from the Gr. *pathos*, disease, and *logos*, a discourse) is that department of medicine which treats of the doctrine of morbid actions or diseases. In this country the term is so far restricted as not to include the causes, treatment, etc., of diseases, but the most eminent French and German writers regard it as equivalent to "the theory and practice of medicine," and consider it as treating not only of the classification, causes, symptoms, and physical signs of diseases, but as also including their seat, the phenomena which precede and follow them, their progress, their duration, their modes of termination, the different forms in which they occur, their complications, the changes to which they give rise in the solids and fluids of the body, and their treatment.

PATKUL, Johann Reinhold, 1660–1707; b. in a prison at Stockholm; of a noble Livonian family; educated for a soldier, attained the rank of capt., but his fame rests principally on his talent for diplomacy. He was prominent in the controversies between the Livonian nobility and the king of Sweden. Having incurred the displeasure of the king he was summoned to Stockholm for trial, was condemned as a rebel, sentenced to death, and his writings destroyed. He escaped to Courland, but his estates were confiscated about 1694. He resided subsequently in Switzerland and France, and busied himself with scientific studies. In 1698 he sued for pardon, was refused, and entered the service of Augustus II. of Saxony, king of Poland; was appointed one of his privy council, and was influential in bringing about the alliance formed against Charles XII. by Augustus II., Peter the Great, and Frederick IV. of Denmark. He made a journey to Russia as ambassador, won the favor of the czar, and became Russian ambassador to Dresden with the rank of gen. In 1705 Augustus II. had him arrested and imprisoned at Königstein, and surrendered him to Charles XII. as one of the conditions of peace (giving secret orders to further his escape), but he was taken out of Saxony by the Swedes, and by the command of Charles was broken on the wheel and beheaded at the convent of Kazimierz near Posen.

PATMORE, Coventry Kearsey Dighton, b. England, 1823; appointed an assistant librarian at the British museum in 1846, and held that position till 1868. His first publication was a volume of *Poems* in 1844. His subsequent works are: *Tamerton Church Tower and other Poems* (1853); *The Angel in the House* (1854–62); *A Garland of Poems for Children* (1862); *The Unknown Eros* (1877); *A Memoir of Barry Cornwall*, and *Amelia* (1878), and his collected poems (1886). He d. in 1896.

PAT'MOS, a bare and rocky island in the Ægean sea, about 45 m. in circumference. It belongs to the group called the Sporades, lies to the s. of Samos, and is now called Patino, but in the middle ages *Palmosa*, although there is now only one palm-tree in the whole island. It is celebrated as the place to which the apostle John was exiled, and where he saw the visions recorded in the book of Revelation. On the top of a mountain stands the famous monastery of "John the Divine," half way up to which a cave is pointed out to the traveler in which, according to tradition, the apostle received his revelations. See Ross's *Reisen auf den Griechischen Inseln des Agäischen Meeres*, and Guérin's *Description de l'Ile de Patmos*, etc. (Paris, 1856).

PATNA, a district of British India, bounded n. by the districts of Sarum, Tirhoot, and Monghyr; e. by that of Monghyr; s. by those of Monghyr and Behar; w. by that of Shahabad; the length from e. to w. is 85 m; breadth, 45; 2079 sq. miles. The Ganges flows along its n. border, and the Son, a tributary of the Ganges, forms the w. and n.w. boundary, and is navigable for a considerable distance. The soil is fertile and well cultivated. Rice, wheat, and barley are grown in abundance. The opium poppy is extensively raised. The climate is very hot in summer, but the winters are mild. The district is traversed by the East India railway, and by several roads. Patna was ceded to the English in 1765. During the mutiny of 1857 every part of the district except the capital was occupied by the rebels. Pop., '81, 1,756,856.

PAT'NA, or more correctly, Pattana (i.e., the town), an important trading city of Hindustan, capital of a British district and division of the same name in Bahar, presidency of Bengal, stands on the right bank of the Ganges, and 140 m. e. of Benares.

The city proper, forming a quadrangle, extends a mile and a half along the river-side, and is half that extent in breadth. Patna is generally supposed, however, to include the suburbs, which stretch on each side of it, on the s. bank of the Ganges. The European quarter is on the w. of the town proper. Here are a church, chapel, Roman Catholic cathedral, government offices, school, the nabob's palace, the great tank, and several noteworthy mosques and tombs. The streets of Patna are covered with mud and slime in winter, and its air is thickly impregnated with choking dust in summer. Pop. '91, 165,200, of which 124,500 were Hindus and 40,100 Mohammedans.

Patna, under the former name of *Padmavati*, is supposed to have been the capital of Bahar, 419 years B.C. Here, at an early period, the English established factories, and traded in opium, rice, etc. In 1763 disputes about transit-duties arose between the company's servants and the native government. A war ensued, resulting in the British taking possession of the district. Patna was the headquarters of the Wahabi or Mussulman conspiracy in 1864. Chief seat of the opium trade; trade also in table-linen, wax candles, toys, bird-cages, and talc-pictures. The division of Patna has an area of 23,467 sq. m., and a pop. of about 15,000,000, the great majority of whom are Hindus and Mohammedans.

PATOIS (of uncertain derivation), the French term applied to corrupt dialects of a language spoken by the uneducated. See DIALECT.

PATON, Sir JOSEPH NOEL, R.S.A., one of the most distinguished living Scottish artists, was born in Dunfermline in 1821. It is understood that in early life he employed himself in making designs for the damask manufacturers of his native place, and for the muslin and lace embroiderers of Paisley. He, however, soon turned his attention to the walk of art proper, and his cartoon sketch, "The Spirit of Religion," gained one of the three premiums at the Westminster Hall competition in 1845. Two years thereafter his oil picture of "Christ bearing the Cross," and his "Reconciliation of Oberon and Titania," jointly gained the prize of £300. He subsequently executed a companion-picture to the "Reconciliation," entitled the "Quarrel of Oberon and Titania;" and both now adorn the royal Scottish academy's galleries in Edinburgh. These pictures made the artist's reputation Although somewhat hard and dry in color, and without any retiring and shadowy depth, they are full of brilliant fancy; and the multitudes of figures, and the variety of fairy incident, affect the spectator much in the way that the constant sparkle of Congreve or Sheridan affects the reader. He has since painted much more simply and powerfully. "Dante Meditating the Episode of Francesca," was exhibited in Edinburgh in 1852; and the "Dead Lady," a work of great and solemn pathos, in 1854. In 1855 his great picture, "The Pursuit of Pleasure," was exhibited in that city, where it was much criticised and much admired. He has since painted "Home from the Crimea," a *replica* of which is in the possession of her majesty; and "In Memoriam," a scene from the Indian mutinies; and for the association for the promotion of the fine arts in Scotland, a series of picture illustrations of the "Dowie Dens o' Yarrow." Among his other pictures of importance are "Dawn: Luther at Erfurt," "The Fairy Raid," "Faith and Reason," "Gethsemane," "Christ and Mary at the Sepulcher," "The Man of Sorrows," "Mors Janua Vitæ," "The Spirit of Twilight," "Thy Will be Done" (1879), etc. Many of his works have been engraved, and are deservedly popular. Along with his brother he illustrated Aytoun's *Lays of the Scottish Cavaliers*, and in 1864 he executed twenty illustrations of the *Ancient Mariner*. Paton was appointed queen's limner for Scotland in 1865, received the honor of knighthood in 1867, and in 1876 was made LL.D. by Edinburgh university. He has published two volumes of poems.

PATONCE, CROSS, in heraldry (Lat. *patens*, expanding), a cross with its terminations expanding like early vegetation or an opening blossom.

PATOS, LAGO DES. See RIO GRAND DO SUL.

PATRAS (ancient *Patræ*, Turk. *Baliabadra*), a fortified sea-port, and the most important trading town in the w. of Greece, in the government of Achaia and Elis, stands on the eastern shore of the gulf of the same name, 70 m. w. n.w. of Corinth. It is overlooked by the strong citadel — on the site of the ancient acropolis — crowning a ridge, on the southern slopes of which the ancient city, as well as the modern one before the revolution, was built. The Patras of to-day stands on a level space close to the sea. The plain of Patras is exceedingly valuable for the currants grown, and which are the most important export of the town. Its harbor, though protected by a mole, is unsafe, and exposed to heavy seas. Earthquakes frequently occur, and most of the houses are on that account only of one story. Capotes are made here of mixed wool and goat's hair; and, besides currants, oils, valonia, raw silk and cotton, wool, hides, wax, etc., are exported. Patras is by far the most important commercial town on the continent of Greece, though it suffered severely during the Greek revolution. Pop. '89, 33,529.

Patræ is the only one of the "twelve cities" of Achaia which still exists as a town, but most of its relics have been swept away by earthquake and revolution.

PATRIA POTESTAS is the term used to express the power which the civil law gave to the Roman father over his children, and which has been the foundation of the greatly modified paternal authority recognized in modern systems of jurisprudence. The right

of a parent to control his child not come to years of discretion is a part of natural law, but the more extensive *patria potestas* of the Romans was probably a relic of those early times in which families, or tribes considered as families, led a wandering pastoral life in dread of each other, under the guidance of a chief, whom it was necessary to invest with an almost unlimited authority.

By the Roman law, the *patria potestas* was acquired naturally, by the birth of a child in wedlock, or civilly, by legitimation or adoption. An unemancipated son or daughter, a grandchild by a son, or any other descendant by males, was viewed as a part of the parent's property. In early times a father had the power of life and death over his children: by the laws of the twelve tables he could sell them as slaves, or could transfer them to another family by adoption. Under the republic, the despotic authority exercised by fathers over their offspring was practically limited to a considerable extent by the censors, and several emperors issued constitutions to restrain the cruelties often perpetrated by fathers towards their children. First the right of sale, and then that of life and death was taken away. Alexander Severus restricted the right of the father to moderate chastisement, and Constantine declared that the father who should kill his son was to be held guilty of murder. By the early Roman law, the son, being in his father's power, could not acquire property for himself; his acquisitions all belonged to his father; hence he was incapable of making a testament. There were, however, particularly in later times, modes by which he could acquire *peculium*, or property which should be independent of his father. A father might give his son property to trade on, which would be his own; and latterly a son acquired for himself whatever he gained in military service, or by the discharge of certain civil functions. In all matters belonging to the *jus publicum* a son was independent of his father; he could vote at the elections, hold the most important offices of state, or command the army. He could also be a tutor, tutory being considered a *munus publicum*. In later times a son promoted to the consular dignity ceased to be under the restraints of paternal control, but, unlike an emancipated son, he retained his rights of succession. Lawful children were entitled to aliment from their parents; an obligation attached in the first instance to the father and mother, and, failing them, to the grandfather. Until the time of Justinian, illegitimate children had only a claim for support against their mother; that emperor gave them a right to demand aliment from their father.

In no modern system has the paternal power been carried so far as under the Roman law. According to the French "code civile," a child is under the authority of his parents till majority or emancipation; up to that time he cannot quit the paternal residence without leave of his father, except for enrollment in the army at 18 years of age. Majority is attained at the age of 21, but a minor is emancipated by marriage. At 15 a minor may be emancipated by his father, or, if his father be dead, by his mother, by a simple declaration before a magistrate. The father possesses somewhat extensive powers of chastisement. He may obtain a warrant to arrest his child under 16, and detain him in prison for a month; and an order may be obtained for the incarceration for six months of a child above 16, on cause shown to the satisfaction of the magistrate. Parents are entitled to the usufruct of their children's property till the age of 18 or emancipation, subject to the burdens of maintenance and education; but this right does not extend to property acquired by the industry of the children, or bequeathed by a stranger under the condition of an exclusion of paternal interference.

By the law of England, a father is guardian to his lawful children in minority, though this right ceases to some extent at 14. He has the power of moderate chastisement. As guardian he receives the rents of any real estate which the child may possess, which he must account for when majority is attained. The paternal power never extends beyond majority, and, to some effect, marriage acts as an emancipation. A father may by deed appoint a guardian to such of his children as are unmarried at his death till thay attain majority.

This term is still recognized in the modern civil law, though its meaning is very different from what it was under the Roman law. It is now practically vested in both parents alike, though generally, as a matter of fact, exercised by the father; and when there is a difference of opinion his will prevails. Parents are entitled to the use of the property of minor children, subject, of course, to the obligation of properly supporting and educating them. In all legal matters the father acts as the general guardian of the child. The father may also designate by will a proper person as guardian for his children after his death, and such a person will become a "testamentary guardian." The power over the child for purposes of correction and training must be exercised with care, and excessive corporal punishment will be looked upon as a misdemeanor.

PA'TRIARCH (Gr. *patriarches*, the head of a tribe) is the name given to the heads of the families in the antediluvian period of Scripture history, and is still more familiar as the designation in Jewish history of the three progenitors of the Jewish people, Abraham, Isaac, and Jacob. In the later history of the Jews, too, after the destruction of Jerusalem, the name was used to designate the heads of the sanhedrim, one of whom, the patriarch of the west, resided at Tiberias, in Galilee, and the other, the patriarch of the eastern Jews, at Babylon. The most familiar use of the word, however, is in the history of the Christian church. It is the name given to the bishops of certain great metropoli-

tan (q.v.) sees, who not only held rank beyond other metropolitans, but also enjoyed a jurisdiction almost identical with that of the metropolitan in his own province over all the metropolitans themselves (with their provinces) included in their district, which was called a PATRIARCHATE. The name patriarch originally seems to have been given commonly to bishops, or at least was certainly given in a less special sense than what it eventually assumed; nor can the date at which the title first assumed its now received use be exactly determined. It is certain, however, that the name and the office were both recognized before the council of Nice, at which time, as we learn from the sixth canon, the patriarchal sees, acknowledged by "ancient custom," were three in number, Rome, Antioch, and Alexandria. After the translation of the seat of empire to Byzantium, thenceforward called Constantinople, that see, originally subject to the metropolitan of Heraclea, obtained, first metropolitan, and afterward patriarchal rank; and eventually established a precedency over the patriarchs of Antioch and Alexandria, being second only to Rome. The contests between the patriarchs of Rome and Constantinople were among the chief causes of the GREEK SCHISM (see GREEK CHURCH). To these four patriarchates was added in 451 A.D. that of Jerusalem, which was formed out of the ancient patriarchate of Antioch. The limits of these five patriarchates can only be loosely assigned. The authority of a patriarch was, in the main, that of a metropolitan, but extended over the metropolitans themselves. He had a right to consecrate the metropolitans, and to preside over the councils of his patriarchate. After the Greek schism, and particularly after the establishment of the Latin kingdom of Jerusalem, Latin prelates were appointed with the title and rank of patriarch in the four great eastern sees. It was hoped that the union of the churches, effected at the council of Florence, would have put an end to the contest thus created; but that union proved transitory, and the double series of patriarchs has been continued to the present day. The Nestorian and Eutychian sections of the eastern churches, too, have each their own patriarch, and the head of that portion of the former which in the 16th c. was reconciled with the Roman see, although known by the title of *Catholicos*, has the rank and authority of patriarch. After the separation of the Russian church from that of Constantinople, the name and authority of the metropolitan in the end was transformed into that of patriarch. But the office was suppressed by Peter the great.

Besides these, which are called the greater patriarchates, there have been others in the western church known by the name of minor patriarchates. Of these the most ancient were those of Aquileia and Grado. The latter was transferred to Venice in 1451; the former was suppressed by Benedict XIV. France also had a patriarch of Bourges; Spain, for her colonial missions, a patriarch of the Indies; and Portugal a patriarch of Lisbon. These titles, however, are little more than honorary.

In the non-united Greek church, the ancient system of the three prtriarchates of Constantinople, Antioch, and Jerusalem is nominally maintained, and the authority of the patriarchs is recognized by their own communion. But the jurisdiction-limits of the patriarch of Constantinople, who is acknowledged as the head, have been much modified. The Russo-Greek church withdrew from him partially in the 17th, and finally in the 18th century. That of Greece proper has been practically separated since the independence of the kingdom of Greece; and some years since it formally declared its independence. The patriarchs of Jerusalem and Antioch have few followers of their own rite.

PATRIARCHAL CROSS, a cross which, like the patriarchal crosier, has its upright part crossed by two horizontal bars, the upper shorter than the lower. A cross patriarchal fimbriated or was a badge of the knights templars.

PATRICIAN (Lat. *patricius*, from *pater*, father), a name given to the members of Roman *gentes*, of whom the *populus Romanus* consisted, and to their descendants by blood and adoption. *Patres*, and *patricii* were in the early days of Rome synonymous; they were so named from the *patrocinium* which they exercised over the whole state, and all classes of whom it was composed. Niebuhr's researches have established that, until the *plebs* became a distinct order, the patricians were the entire citizens or *populus* of Rome; a select number of them were senators; and the original inhabitants, reduced to a condition of servitude, were known by the name of *clientes* or *plebs*. The amalgamation of the three tribes of Ramnes, Tities, and Luceres, gave rise to a distinction between *patres majorum gentium* and *patres minorum gentium*—the latter term being applied to families recently elevated to an equality with the old patrician class. On the establishment of the plebeians as a distinct order, sharing certain rights with the patricians, the patriciate became an aristocracy of birth, in the exclusive possession of a number of important privileges. A long struggle between the two orders ended in the attainment by the plebeians of a political equality, and the establishment of a new aristocracy of *nobiles* based on wealth and office. Under Constantine the dignity of *patricius* became a personal title; not hereditary, but conferring very high honor and certain privileges. It was created at Constantinople, and not confined to Romans or subjects of the empire, but sometimes bestowed on foreign princes. These patricians, unlike the old Roman order, were distinguished in dress and equipage from the ordinary citizens. The popes in after times conferred the same title on eminent persons and princes, including many of the German emperors. In several of the Germanic kingdoms the title of patrician

was bestowed on distinguished subjects; and in some parts of Italy the hereditary nobility are still styled patricians.

PATRICK, a co. in s.w. Virginia, having the state line of North Carolina for its s. border, a range of the Alleghany mountains on the w. and n.w., drained by Dan, Smiths, Mayo, and North and South forks, affluents of the Roanoke, rising in its w. section; 521 sq.m.; pop. '90, 14,147, chiefly of American birth, inclu. colored. Its surface is mountainous in the w. portion, containing features of great natural beauty for which the region is celebrated; in the e. it stretches into broad plains extensively covered with forests. Live stock is raised, and the soil is adapted to the production of grain, honey, sweet-potatoes, cotton, tobacco, and dairy products. Iron ore is the principal mineral product which is abundant. Co. seat, Stuart.

PATRICK, Saint, a distinguished missionary of the 5th c., commonly known as the apostle of Ireland. There is some uncertainty as to the date and place of his birth. The year of his birth is variously assigned to the years 377 and 387, of which the latter, if not even a later date, is more probable. Of the place, it is only known for certain, from his own confession, that his father had a small farm near Bonavem Taberniæ; and in one of the ancient lives he is said to have been born at Nemthur. Arguing on these data, connected with other collateral indications, some writers assign his birthplace to the present Boulogne-sur-Mer; others to a place in the estuary of the Clyde (called from him Kilpatrick) at or near the modern Dumbarton. His father, he himself tells, was a deacon named Calpurnius; his mother, according to the ancient biographers, was named Conches or Conchessa; according to some of these authorities, a sister of St. Martin of Tours. Patrick's original name is said to have been Succat, Patricius being the Roman appellative by which he was known. In his 16th year he was seized, while at his father's farm of Bonavem Taberniæ, by a band of pirates, and with a number of others was carried to Ireland, and sold to a petty chief, in whose service he remained for 6 years; after which he succeeded in effecting his escape, and, probably after a second captivity, went to France, where he became a monk, first at Tours, and afterwards in the celebrated monastry of Lerins. In the year 431 he went to Rome, whence he was sent by the pope of the day, Celestine, to preach in Ireland; Palladius, who had been sent as missionary to that country a short time before, having died. Such is the received account of his mission; but Dr. Todd, his latest biographer, regards this statement as erroneous, and fixes the date of his coming to Ireland 8 years later. He was ordained in France, and arrived in Ireland in 432. His mission was eminently successful. He adopted the expedient of addressing himself first to the chiefs, and of improving, as far as possible, the spirit of clanship, and other existing usages of the Irish for the furtherance of his preaching; nor can it be doubted that he had much success in Christianizing the ancient Irish system of belief and of practice. By degrees he visited a large portion of the kingdom, and baptized great numbers as well of the chieftains as of the people. According to the accounts of his Irish biographers, he founded 365 churches, and baptized with his own hand 12,000 persons. He is said also to have ordained a vast number of priests, and to have blessed very many monks and nuns. After he had been about 20 years engaged in his missionary enterprise, he is said to have fixed his see at Armagh about the year 454; and having procured two of his disciples to be ordained bishops, he held probably more than one synod, the decrees of which have been a subject of much controversy. He died at a place called Saul, near Downpatrick; and his relics were preserved at Downpatrick down to the period of the reformation. The place is still venerated by the people. The date of his death is much disputed; the Bollandists placed it in 460, while Ussher holds it to have been 493. Dr. Todd inclines strongly to the latter opinion, in which case Patrick's age would have been 126, or at least 116. The only certainly authentic literary remains of St. Patrick are his "confession" and a letter, both of very rude Latinity, but of much historical interest. The letter is addressed to Coroticus, who is supposed to have been a Welsh chieftain named Caradoc (from whom Cardigan is named), who had made a descent on the Irish coast, and slain or carried off, with circumstances of great cruelty, a number of the Irish, many of whom were neophytes. These, with some other remains ascribed to him, as also decrees of synods, were published in Wilkins's *Concilia,* and separately by Ware, *Opuscula S. Patricii Adscripta* (1656) and by Villanueva (Dublin, 1835). The latest biography of St. Patrick is that of the Rev. J. H. Todd, 1 vol. 8vo (Dublin, 1863). St. Patrick's Day is March 17th.

PATRICK, Saint, Order of, a national order of knighthood for Ireland, established by George III. on Feb. 5, 1783, and enlarged in 1833. As originally constituted, it consisted of the sovereign, the grand-master (who was always the lord-lieut. of Ireland for the time being), and 15 knights. By the statutes of 1833 the number of knights was increased to 22.

The *collar* of the order (of gold) is composed of roses alternating with harps, tied together with a knot of gold, the roses being enameled alternately white within red, and red within white, and in the center is an imperial crown surmounting a harp of gold, from which the badge is suspended. The *badge* or *jewel* is of gold, and oval; surrounding it is a wreath of shamrock proper on a gold field; within this is a band of sky-blue enamel charged with the motto of the order, Quis Separabit mdcclxxxiii. in gold letters; and within this band a saltire gules (the cross of St. Patrick), surmounted by a

shamrock or trefoil slipped vert, having on each of its leaves an imperial crown or. The field of the cross is either argent, or pierced and left open. A sky-blue *ribbon*, worn over the right shoulder, sustains the badge when the collar is not worn. The STAR, worn on the left side, differs from the badge only in being circular in place of oval, and in substituting for the exterior wreath of shamrocks eight rays of silver, four of which are larger than the other four. The MANTLE is of rich sky-blue tabinet, lined with white silk, and fastened by a cordon of blue silk and gold with tassels. On the right shoulder is the HOOD. The order is indicated by the initials K. P.

PATRICK, MARSENA R., b. N. Y., 1811 graduated at West Point in 1835 and received his commission in the 2d infantry; promoted to 1st lieut., 1839; capt., 1847; served in the Mexican war as commissary under Gen. Wool, and was brevetted maj. for his conduct there. In 1850 he laid down his commission and interested himself in practical farming and in the scientific and experimental teaching of agriculture. In 1861 he was made inspector-gen. of the N. Y. militia, rendered great service in organizing the troops, and in 1862 was made brig.gen. of volunteers, took part in the Shenandoah valley and Virginia campaign, and at Antietam commanded a brigade of the 1st corps. In 1862 he was appointed provost-martial-gen. of the Potomac army, held the position till the close of the war, and then held the same rank in the military department of Virginia. In 1865 he resigned; became president of the N. Y. state agricultural society; and from 1880 till his death in 1888 was governor of the National Soldiers' home, Dayton, O.

PATRICK, SIMON, D.D., 1626–1707; b. Gainsborough, Lincolnshire, Eng.; entered Queen's college, Cambridge, at the age of 18; and received a fellowship in 1648; took orders, and in 1658 was received as chaplain into the family of sir Walter St. John, of Battersea. In 1662 he was appointed rector of St. Paul's, Covent Garden, London, endearing himself to his people by his faithful instructions, and especially by his remaining with them during the plague of 1665. In 1666 he was made chaplain in ordinary to the king. In 1672 he was made prebendary of Westminster, and in 1679 dean of Peterborough. During the reign of James II. he defended Protestantism against the papists. He was appointed to preach before the prince and princess of Orange. In 1689 he was made bishop of Chichester, and in 1691 transferred to the see of Ely. In his early life, he wrote against the Non-conformists, in a pamphlet entitled *A Friendly Debate between a Conformist and a Non-conformist*, but after he became bishop he changed his opinion, regarded them with favor, and used his great influence to allay strife. He stood next to Tillotson in learning and influence. Of his numerous works were, *Mensa Mystica*, or *A Discourse concerning the Sacrament of the Lord's-Supper; The Heart's Ease, or a Remedy against all Troubles; Jewish Hypocrisy, a Caveat to the Present Generation; Sermons; Tracts against Popery; Paraphrases and Commentaries upon the Holy Scriptures.* The last are published usually with the commentaries of Louth, Arnald, Whitby, and Lowman, entitled *A Critical Commentary and Paraphrase on the Old and New Testament and the Apocrypha.* The historical and poetical books of the Old Testament are by Bishop Patrick. A complete edition of his works was published in 1858 by the Rev. Alexander Taylor, in 9 vols. His *Autobiography* was published at Oxford in 1839.

PATRIOTS' DAY, the anniversary in the state of Massachusetts of the momentous double battle of Concord and Lexington on April 19th, 1775, when the first American blood was shed in the cause of liberty. It was first observed April 19th, 1894.

PATRIPASSIANS (Lat. *pater*, father, and *passus*, suffered), the name of one of the earliest classes of anti-Trinitarian sectaries, who, in maintaining the oneness of the Godhead, held that all that is ascribed in the Scriptures, according to the Trinitarian exposition, to any of the Three Persons, is in reality true of the one Principal, whom alone these sectaries admitted, being in consequence called "Monarchians" (Gr. *monos*, one, and *archē*, principle). The leader of this sect was Praxeas, a native of Phrygia, who lived in the end of the 2d century. The name Patripassians, for which the Greek equivalent was *Patropaschites*, was in some sense a sobriquet, being founded on what their antagonists regarded as the absurd consequence derivable from their doctrine—viz., that as it was true to say that Jesus, in whom dwelt the Logos, or the Son, suffered, therefore it would be true on their principles to say that the Father suffered. The sect in this particular form was chiefly known in Rome; but their principals are in the main the same with those of the Sabellians. In Rome, Praxeas was succeeded by Noetus, but the party does not appear to have been numerous or influential.

PAT'ROCLUS. See ACHILLES.

PATROL is a detachment of 5 or 6 soldiers, fully armed, sent out, under a sergeant, from the mainguard or picket to traverse the streets of a garrisoned town, etc., and arrest disorderly persons or soldiers out of barrack without proper passes. Prisoners are taken to the guard-house, and brought before the town-major.

PATRON (Lat. *patronus*, from *pater*, father), among the Romans originally signified a citizen who had dependents, who were called *clients*, attached to him. Before the time of the Laws of the Twelve Tables, the most frequent use of the term *patronus* was in opposition to *libertus*, these two words being used to signify persons who stood to one another in the relation of master and manumitted slave. The Roman was not denuded of all right in his slave when he freed him; a tie remained somewhat like that of parent

and child, and the law recognized important obligations on the part of the *libertus* toward his patron, the neglect of which involved severe punishment. In some cases the patron could claim a right to the whole or part of the property of his freed man The original idea of a patron apart from the manumitter of slaves continued to exist. A Roman citizen, desirous of a protector, might attach himself to a patron, whose client he thenceforward became; and distinguished Romans were sometimes patrons of dependent states or cities, particularly where they had been the means of bringing them into subjection. Thus the Marcelli were patrons of the Sicilians, because Claudius Marcellus had conquered Syracuse and Sicily. The patron was the guardian of his client's interest, public and private; as his legal adviser, he vindicated his rights before the courts of law. The client was bound, on various occasions, to assist the patron with money, as by paying the costs of his suits, contributing to the marriage portions of his daughters, and defraying in part the expenses incurred in the discharge of public functions. Patron and client were under an obligation never to accuse one another; to violate this law amounted to the crime of treason, and any one was at liberty to slay the offender with impunity. One obvious effect of the institution of *clientela* was the introduction of an element of union between classes of citizens who were otherwise continually brought into opposition to each other. As the patron was in the habit of appearing in support of his clients in courts of justice, the word *patronus* acquired, in course of time, the signification of advocate or legal adviser and defender, the client being the party defended; hence the modern relation between counsel and client.—*Patron*, in after times, became a common designation of every protector or powerful promoter of the interests of another; and the saints, who were believed to watch over the interests of particular persons, places, trades, etc., acquired in the middle ages the designation of their patron saints. The saint in whose name a church is founded is considered its patron saint.

The term patron has also been applied to those who endowed or supported churches and convents. See PATRONAGE, ECCLESIASTICAL.

PAT'RONAGE, ECCLESIASTICAL, the right of presenting a fit person to a vacant ecclesiastical benefice. The patron, in the original and more strict sense, was the person who founded or endowed the church. In the early ages of Christianity the countries where the new religion had been adopted were parceled out into large districts or dioceses, under the superintendence of a bishop, who usually resided in the neighborhood of one of the religious houses. Within such district the bishop had the nomination of the priests, who supplied religious instruction to the people. The priests were paid out of the episcopal treasury, and traveled about in the exercise of their duties, having their residence with the bishop, and forming that *episcopi clerus* which constituted the notion of cathedral churches and monasteries in their simplest form. Occasionally a bishop endowed a church in his diocese and attached a priest permanently to it; and in Gaul, in the 5th c., a bishop who founded a church in a neighboring diocese was allowed to appoint an incumbent of his choice. As Christianity became more universal, and the population increased, the means of worship supplied by the bishoprics, the monasteries, and occasional episcopally endowed churches, became inadequate for the demands of the people, and the proprietors of lands began to build and endow churches in their own possessions. In such cases the chaplain or priest was not paid by the bishop, but allowed to receive for his maintenance, and for the use of his church, the whole or a part of the profits of the lands with which the founder had endowed it, and the offerings of those who frequented the church for worship. A district was defined by the founder, within which the functions of the officiating priest were to be exercised; and both the burden and the advantages of his ministry were limited to the inhabitants of that district. As these pious foundations tended both to the advancement of religion and to the relief of the episcopal treasury, they were encouraged by the bishops, who readily consecrated the churches thus established, and consented that the incumbent should be resident at the church, and receive the tithes and offerings of the inhabitants and what endowment the founder had annexed to the church. Eventually, it came also to be stipulated with the bishop that the founder and his heirs should have a share in the administration of the property, and have the right to nominate a person in holy orders to be the officiating minister whenever a vacancy occurred. It also became a not unusual arrangement that when owners of estates rebuilt such churches as were dependent on the cathedral, or undertook to pay the incumbent, to the relief of the cathedral, the right of presentation was transferred from the bishop to these persons, who thenceforward stood in the same relation to these churches as if they had been the original founders. Out of these private endowments arose the parochial divisions of a later time, which thus owe their origin rather to accidental and private dotation than to any legislative scheme for the ecclesiastical subdivision of the country. The bounds of a parish were at first generally commensurate with those of a manor, and the lord of the manor was the hereditary patron. The person enjoying the privileges of a founder was called *patronus* and *advocatus*. He had a pre-eminent seat and a burial-place in the church; he enjoyed a precedence among the clergy in processions; his name and arms were engraved on the church and on the church-bells, and he was specially named in the public prayers. He had the right to a certain portion of the church funds, called *patronagium*, and enjoyed the fruits of the benefice during a vacancy. In the course of time it sometimes happened that, with the concurrence of all parties

interested, the patronage, and the church with its revenues and appurtenances, were made over to a religious house, which thus became both patron and perpetual incumbent of the parish, while the immediate duties of the cure were devolved on a vicar or stipendiary curate. In France the right of patronage was often extended to churches not originally private foundations by the necessities of the sovereigns, which led them to take possession of church property, and bestow it in fee on laymen, who appropriated the greater part of the revenues, and took the appointment of the clergy into their own hands. For a length of time not merely the nomination but the investiture of the clergy came to be exercised by lay patrons, a state of matters which roused the indignation of successive popes and councils: until it was at last ruled by the third and fourth lateran councils (1179 and 1215 A.D.) that the presentation of the patron should not of itself suffice to confer any ecclesiastical benefice, even when qualified by the discretionary power of rejection given to the bishop, when the presentee was a layman. It was declared necessary that the presentee should not merely have the temporalities of the benefice conferred on him by induction, but also be invested with the spiritualities by institution. When the bishop was patron of the benefice the ceremonies of induction and institution were united in that of collation. With the growth of the papal power, however, a practice arose by which the right of presentation or induction, which had nominally been left to the patrons, became in some degree nugatory. Toward the close of the 12th c., letters of request, called mandates or expectatives, began to be issued by the popes to patrons, praying that benefices should be bestowed on particular persons. What had at first been requested as a favor was soon demanded as a right, and a code of rules was laid down with regard to grants and revocations of expectatives. In the 13th c. the patronage of all livings whose incumbents had died at the court of Rome (*vacantia in curiâ*) was claimed by the pope; and, as ecclesiastics of all ranks from every part of Europe frequently visited Rome, the number of benefices *vacantia in curiâ* was always very great. Clement V. went so far as broadly to declare that the pope possessed the full and free disposal of all ecclesiastical benefices. The practice next arose of the pope making reversionary grants, called provisions of benefices, during the lifetime of the incumbent, and reserving what benefices he thought fit for his private patronage. By means of permissions to hold benefices *in commendam*, and dispensations for non-residence and holding of pluralities, upwards of fifty benefices were often held by one person; and throughout all Europe the principal benefices were filled by Italian priests, nominees of the popes, who were often ignorant of the very language of the people among whom they ministered. In the 14th c. these claims encountered much opposition. England took the lead in an organized resistance, which was in the end successful. A series of English statutes was passed, beginning with the statute of provisors, 25 Edw. III. c. 6, solemnly vindicating the rights of ecclesiastical patronage, and subjecting to severe penalties (see PRÆMUNIRE) all persons who should attempt to enforce the authority of papal provisions in England. The principles adopted by the third and fourth Lateran councils have since been substantially the law of patronage in Roman Catholic countries. A lay patron is, by the canon law, bound to exercise his right of presentation within four, and an ecclesiastical patron within six months, failing which the right to present accrues *jure devoluto* to the bishop of the diocese. Patronage has always been more or less subject to alienation, transmission, and the changes incident to other kinds of property. The modern practice of patronage in the Roman Catholic church is detailed under the head provision (q.v.).

In England, where the modified canon law, which was in use before the reformation, is still in force, the rights of patrons do not materially differ from those which they possess in Roman Catholic countries. For some details regarding the right of presentation in England see ADVOWSON.

In Scotland, at the reformation, the rights of patrons were reserved, and presbyteries were bound by several statutes to admit any qualified person presented by the patron. The principle of these statutes was retained in the enactments introducing episcopacy. On the establishment of presbytery under favor of the civil war, patronage was abolished by act 1649, c. 23, and the election of the clergy was committed to the kirk-session. At the restoration this statute fell under the act rescissory, and patronage was replaced on its former footing. On the re-introduction of presbytery at the revolution patronage was again canceled, and the right to present conferred on the Protestant heritors and the elders of the parish, subject to the approval or rejection of the whole congregation. In consideration of being deprived of the right of presbytery at the revolution, patronage was the parish a compensation of 600 merks (£33 6*s*. sterling), on payment of which they were to execute a formal renunciation of their rights. Only three parishes effected this arrangement with the patron, and patronage was permanently restored in all the parishes where no renunciation had been granted by 10 Anne, c. 12. This act, with modifications introduced by 6 and 7 Vict. c. 61, was law till 1874. If a patron failed to present for six months after the occurrence of a vacancy, the right to present fell to the presbytery *jure devoluto*. The presentee, before he acquired a right to the emoluments of the benefice, required to be admitted to it by the presbytery of the bounds. He was first appointed to preach certain trial sermons, after which a day was fixed within six weeks for moderating in his call. On that day the people were invited to sign a written call to the presentee to be their minister, and however few the signatures to the call might be, the presbytery were in use to pronounce a formal judgment sustaining it. They then proceeded to

examine into the qualifications of the presentee, and, provided the result were satisfactory, the ordination followed (if he had not been previously ordained), and he was formally admitted minister of the parish by the presiding minister. Soon after the above-mentioned act of queen Anne, a feeling which had sprung up in favor of popular election, in opposition to patronage, led to various acts of resistance to the settlement of presentees, and brought about two considerable secessions from the church of Scotland. It continued for a length of time to be a subject of dispute how far the right of the church to judge of the fitness of presentees could entitle her to make rules tending to disqualify them, and in particular whether she could legally make the dissatisfaction of the congregation a disqualification. For a long time prior to 1834 there had been no attempt to give effect to any dissent on the part of the congregation. In that year the law of patronage again became a ground of contention, when a majority of the general assembly embodied their views on the subject in the so-called veto act, which declared that no minister was to be imposed on a congregation when a majority of heads of families and communicants should dissent from his admission. The decision of the court of session, confirmed by the house of lords, finding this act to be *ultra vires* of the general assembly, led to the secession of 1843 and formation of the *Free church* (q.v.). After that event an act, 6 and 7 Vict. c. 71, commonly called lord Aberdeen's act, was passed to fix by a legislative provision the effect which the church courts were in future to be entitled to give to the dissent of the congregation in the collation of ministers. It was there enacted that after the trial sermons, the presbytery should give to the parishioners, being members of the congregation, an opportunity to state objections which did not infer matter of charge to be proceeded against according to the discipline of the church. The presbytery were either to dispose of the objections, or to refer them to the superior church judicatory; and if they were considered well founded, the presbytery might reject the presentee. No power was given to reject him on the ground of mere dislike by any portion of the congregation. By an act of parliament in 1874 patronage was abolished, and the right of choosing their minister transferred to the congregation, provision being made to compensate the previous patron to the extent of one year's stipend of the parish.

In the Protestant churches of Germany, Sweden, and Denmark, patronage exists to some extent, subject to restrictions, which differ much in different localities. The right to present is sometimes divided between the patron and the consistory.

In the Greek church the right to present is generally in the hands of the bishops, excepting in Russia, where lay patronage exists to a limited extent.

PATRONOMATOLOGY is a dissertation treating of the origin of the names of men, showing their relations to the arts or professions, their illustration of some quality or characteristic, or any other fact or circumstance from which they may have originated.

Suabia, St. George.
Sweden, SS. Bridget, Eric, Anscharius, and John.
Switzerland, SS. Martin, Gall, and Mary.
Venice, SS. Mark, Justina, and Theodore.
Wales, St. David.

PATROON. In the early settlement of America, the Dutch West India Company found it expedient, in order to facilitate emigration, to authorize its members in New York to take possession of land on the banks of the streams, with the proviso that, within a limited time, fifty settlers should be introduced for every mile of land occupied. The person so pledging himself received the title and privileges of a lord patroon or protector, and his colony or manor was governed by the same laws as were the feudal colonies of the United Provinces. After the revolution a very large proportion of the land of New York was occupied by these patroons, who were the landlords; and the farmers or cultivators held their leases for one or more lives, or from year to year, their rents, dues, and services being provided for, according to feudal tenures of England and Holland. In 1779 and 1785 laws were passed by the state abolishing the claims of the patroons, but the proprietors or patroons of the manor grants refused to give them up entirely, arranging with the cultivators to pay their rents, dues, and perform services in exactly the same manner as before. The countries of Albany, Rensselaer, Columbia, Greene, Ulster, Delaware, Schoharie, Montgomery, Herkimer, Otsego, and Oneida are those in which most of these grants were found. But the above arrangements not proving satisfactory to the tenants, the turbulent spirits among them formed associations to devise means for ridding themselves of these burdens, which were called anti-rent associations. The feeling exhibited itself very strongly by resistance to the collection of the rent by the patroons, even though that rent might be merely nominal. The anti-rent associations finally concluded to form a political party of their own, whose policy should be to elect all town and county officers from their own ranks, and to vote for no state, civil, judicial, or executive officers unfriendly to them. This had some influence, and Gov. Wright was defeated by 10,000 majority for John Young, their candidate. Under him the excitement died out, in 1847, and the party was merged into others. See ANTI-RENTERS. VAN RENSSELAER, STEPHEN.

PATRONYM'IC (Gr. *pater*, father, and *onoma*, name), properly a name taken from one's father, but generally applied to such names as express descent from a parent or ancestor. In Sanskrit, Greek, and Latin, patronymics are very numerous. They may be derived from the name of a father, mother, grandfather, or remoter ancestor, as Atrides, i.e., (Agamemnon), son of Atreus; Philyrides, i.e., (Chiron), son of Philyra; Æacides, i.e., (Achilles), grandson of Æacus. The names of the founders of nations have also been used to form a sort of patronymic, as when the Romans are called Romulidæ. In Greek and Latin the commonest terminations of patronymics are *ides* and *is*. Patronymics have no fewer than thirteen recognized terminations in Sanskrit. A number of the surnames in use in modern times are patronymics, as Johnson, the son of John; Thomson, the son of Thomas. Originally these names fluctuated from generation to generation, as still is, or very recently was, the case in Shetland, where Magnus Johnson's son calls himself John Magnusson or Manson. In the course of time, it was generally found more convenient to take a surname from one well-known ancestor, which should descend unchanged to the children of the bearer of it. The termination *s* is sometimes used as equivalent to son, as in Jones, Rodgers. To patronymics belong Norman, Highland, Irish, and Welsh surnames with the prefixes of *Fitz*, *Mac*, *O*, and *Ap*, respectively. In many cases the *Mac* of the Highlands of Scotland ceased to have a fluctuating character only a few generations ago. In 1465 an act of the parliament of Ireland was directed against the use of patronymics. Every Irishman "dwelling betwixt or among Englishmen in the counties of Dublin, Myeth, Uriel, or Kildare," was ordered "to take to him an English surname of a town, as Sutton, Chester, Trym, Skryne, Corke, Kinsale; or color, as White, Blacke; or arte or science, as Smith or Carpenter; or office, as Cooke or Butler; and that he and his issue should use the same." In Wales it was long the practice to use a string of ancestral names, each with the syllable *Ap* prefixed to it. Camden relates that "in the time of king Henry VIII. an ancient worshipful gentleman of Wales being called at the pannell of a jury by the name of Thomas Ap William Ap Thomas Ap Richard Ap Hoel Ap Evan Vaghan, etc., was advised by the judge to leave that old manner; whereupon he afterwards called himself Moston, according to the name of his principal house, and left that surname to his posteritie." See NAME.

PATTÉE, CROSS, in heraldry (Lat. *patulus*, spreading), also called cross formée, a cross with its arms expanding towards the ends, and flat at their outer edges.

PATTEN, SIMON NELSON, b. at Sandwich, Ill., May 1, 1852. He studied at the Northwestern university (Ill.), and at the university of Halle (Germany), receiving the degree

of Ph.D. in 1878. Ten years later he became professor of political economy in the university of Pennsylvania. Among his works are *The Stability of Prices* (1888), *The Consumption of Wealth* (1889), *The Economic Basis of Protection* (1890), *Principles of Rational Taxation* (1890), *The Educational Value of Political Economy* (1891), and *The Theory of Dynamic Economics* (1892). He has also contributed many valuable papers and essays to various economic periodicals.

PATTERSON, CARLILE POLLOCK, b. Miss., 1816; appointed midshipman 1830. He afterwards graduated at Georgetown college as a civil engineer, and was attached to the coast survey, 1838–41. He was 2d lieutenant of the U. S. ship *Boxer* till 1845, when he re-entered the coast survey, and led a hydrographic expedition to the gulf of Mexico. In 1861 he was appointed hydrographic inspector in the U. S. coast survey, of which he was appointed superintendent in 1874. He d. 1881.

PATTERSON, DANIEL TOD, 1786–1839; b. Long Island, N. Y.; entered the navy in 1800. He was on board the frigate *Philadelphia* in the expedition commanded by Capt. William Bainbridge, engaged in the blockade of Tripoli, Oct. 31, 1803, when the frigate ran upon the rocks and the vessel and entire crew were captured, all on board being held as prisoners in Tripoli for 13 months, or until peace was declared. On Jan. 24, 1807, he was promoted to the rank of lieutenant, and on July 24, 1813, to master-commander. He co-operated with Gen. Andrew Jackson in 1814–15 in the defense of New Orleans, commanding the naval forces, and lending such support as to assure the victory over the British, and elicit an expression of appreciation from congress. He commanded the expedition to capture the defenses of the corsair Lafitte on the island of Grand Terre in Barataria bay, took the settlement and all its vessels in port at the time, but failed to seize the pirate and his comrades. He was made captain Feb. 28, 1815; commanded the frigate *Constitution*, 1826–28; and was appointed navy-commissioner in the latter year, holding the position 4 years. In 1832–36 he was sent to the Mediterranean in command of a squadron, and on his return accepted the position of commandant at the navy-yard at Washington, which he held at his death.

PATTERSON (BONAPARTE), ELIZABETH, 1785–1879; b. Baltimore, Md.; educated chiefly by her mother, and noted for her remarkable beauty. Dec. 24, 1803, Jérôme Bonaparte, brother of Napoleon I., who was visiting the United States, married her after much resistance on the part of her family, the ceremony being performed by the Roman Catholic bishop of Baltimore. This marriage greatly incensed Napoleon, then first consul of France, who ordered his brother, who was in the French naval service, to return immediately to France, while prohibiting all French captains from receiving the wife of Lieut. Bonaparte on board their vessels, and refusing to give her an asylum in France. The French senate, by special act, refused to recognize the ceremony of marriage in this instance as valid, on the ground that it was without consent of the mother of Jérôme, and without previous publication in France. On the accession of Napoleon to the imperial throne, Jérôme was excluded from the dynasty in company with his brother Lucien, who had also made a marriage obnoxious to the emperor. The latter offered to make an allowance of 60,000 francs per year to Jérôme's bride if she would surrender the name of her husband. But this offer was rejected. Jérôme and his wife proceeded to Europe in 1804, but on reaching Lisbon, only the former was permitted to land, and his wife sailed for Amsterdam. No efforts could induce Napoleon to reconsider his determination, and in the end he even induced or forced his brother to contract another matrimonial alliance. Jérôme was married on Aug. 12, 1807, to the princess Frederika Catharina, daughter of the king of Würtemberg. In 1815 Mme. Bonaparte was divorced from her husband by a special act of the legislature of Maryland. She again visited Europe, where she achieved a profound impression by her beauty and intellectual gifts. She lived abroad for many years, only occasionally returning to her native land for a brief visit. By Jérôme she had one son, Jérôme Napoleon Bonaparte, who was eventually recognized by Napoleon III. as being legitimately a member of the family, and who was established in his rights as of French birth by a decree dated Aug. 30, 1854, though he was denied all right of succession. The last 18 years of Mme. Bonaparte's life were passed in Baltimore in obscurity, in a quiet boarding-house. See BONAPARTE, JÉROME.

PATTERSON, JOHN, 1744–1808; b. Conn,; educated at Yale, and admitted to the bar. He settled in Lenox, Mass., in 1774, and was elected a member of the Massachusetts provincial congress. The day after the news of the battle of Lexington reached Lenox, Patterson set out for Cambridge with a regiment of minute-men. They arrived in time to work upon the first redoubt along the lines around Boston. Patterson afterwards went to Canada, and took part in the battle of the Cedars. His regiment then went to New Jersey, and was in the battles of Trenton and Princeton. He was appointed a brigadier-general in Feb., 1777; led his brigade at Stillwater; and continued in the service through the war, witnessing the surrender of Burgoyne and the battle of Monmouth. He held a command in the Massachusetts militia during Shays's rebellion in 1786. He afterwards settled in Lisle, New York, and became county judge of Broome county. He served 4 terms in the state legislature, was a member of the state constitutional convention of 1801, and of congress, 1803–5.

PATTERSON, ROBERT, LL.D., 1743–1824; b. Ireland; emigrated to Philadelphia in 1768; was principal of an academy in Wilmington, Del., 1774; was assistant surgeon and brigade-major in the revolutionary war in 1776–78. In 1779–1814 he was professor

PATTERSON, ROBERT, LL.D., 1743–1824; b. Ireland; emigrated to Philadelphia in 1768; was principal of an academy in Wilmington, Del., in 1774; was assistant surgeon and brigade major in the revolutionary war in 1776–78. In 1779–1814 he was professor of mathematics in the university of Pennsylvania, and vice-provost; in 1805–24 was director of the U. S. mint; was chosen in 1819 president of the American peace society, and later, president of the American philosophical society. He is the author of *The Newtonian System;* an *Arithmetic;* and contributed many papers to the *Transactions* of the American philosophical society. He also edited Ferguson's lectures on *Mechanics,* his *Astronomy,* and Webster's and Ewing's *Natural Philosophy.* He was an elder in the Scotch Presbyterian church nearly half a century.

PATTERSON, ROBERT, 1753–1827; b. Penn.; in 1775 emigrated to Kentucky and became noted as a frontiersman and Indian fighter. He was concerned in Col. Clarke's expeditions against the Indians from 1778 to 1781, and in Bowman's attack on Chillicothe (1779). He also took part in the battle of Lower Blue Lick under Daniel Boone. He was the original owner of a large part of the land now occupied by the city of Cincinnati, Ohio.

PATTERSON, ROBERT, b. Ireland, 1792; came to this country while very young, and was employed in the counting-room of a merchant in Philadelphia. Subsequently he received a collegiate education and decided to enter the army. He was commissioned 1st lieutenant 22d infantry, 1813; in 1814 was made captain 32d infantry. After the war he turned his attention to manufactures, owning a number of factories, and when the Mexican war broke out resumed his sword and was appointed major-general U. S. volunteers, July 7, 1846, and participated in the battle of Cerro Gordo, April 18, 1847, under Gen. Winfield Scott, leading the cavalry charge and keeping his position in the front during the flight of the defeated Mexicans. In the war of the rebellion he entered the volunteer army as maj.gen. of Pennsylvania volunteers at the first call April 15, 1861, for 75,000, 3-months men, and was assigned to the command of the department which included the states of Pennsylvania, Delaware, Maryland, and the district of Columbia. He was mustered out of the service at the expiration of his commission, July 27, 1861, and afterward lived in Philadelphia, engaged in manufacturing. In 1865 he published a *Narrative of the Campaign in the Valley of the Shenandoah in* 1861, a vindication of the course pursued by him while in command at Winchester, prior to the unfortunate battle of Bull Run. He d. 1881.

PATTERSON, WILLIAM, LL.D., 1744–1806; b. at sea, his parents being Irish emigrants; educated at the college of New Jersey, where he graduated in 1763; afterwards studied law and was admitted to practice in 1769. He was a member of the New Jersey constitutional convention of 1776, and for the next ten years was state attorney-general. He was a member of the constitutional convention of 1789, and the same year was elected U. S. senator. In 1794 he was appointed judge of the U. S. supreme court and held that position until his death. In 1799 he published a revision of the laws of N. J. under the authority of the legislature.

PATTESON, JOHN COLERIDGE, D.D., 1827–71; b. at London; a relative of the celebrated Samuel Taylor Coleridge; and his father judge Patteson was an eminent lawyer. He was educated at Merton College, Oxford, became a fellow in 1852; was ordained in 1853 and made curate of Alfington; went in 1854 with Bishop Selwyn to New Zealand, where he assisted the bishop in a missionary college, and labored as a missionary until 1861, when he was made bishop of the Melanesian islands. He learned the languages of the islands with great facility, reduced the different dialects to writing, obtained a printing-press and types, and printed the grammars of nearly 30 of them. He translated hymns and portions of the Scriptures. He was a man of uncommon versatility, applying his mind or hands to whatever function high or humble, in which he might benefit the people. He made frequent excursions to the different islands, which were attended with great peril, either from shipwreck or from the hostility of the natives. In April, 1871, he set out on a voyage of visitation, and in September found himself off the Santa Cruz group where he had long desired to preach the Gospel. The natives had become distrustful of the whites, as many of their number had been captured by traders from Australia; and the traders having painted their ship like the bishops, the danger was greatly increased. The bishop landed on the beach, but was slain by the savages. His life has been written by Miss C. M. Yonge (2 vols., 1874), and also by Francis Awdry, *The Story of a Fellow-Soldier* (1875).

PATTI, ADELINA MARIA CLORINDA, a popular operatic singer of Italian extraction, b. at Madrid, Feb. 19, 1843. After a course of professional study, she sang at an early age in New York. Her *début* in London took place in 1861 as Amina in *La Sonnambula;* and she has ever since been looked upon as one of the first singers of the day. Her voice is an unusually high soprano, of rich, bell-like quality, and remarkable evenness of tone; to these qualities she adds purity of style and high artistic finish Equally at home in the tenderness of deep passion and the sprightly vivacity of light comedy, she has also sung with success in oratorio. She has also won golden opinions on the continent, wherever she has appeared, receiving, in 1870, the order of merit from the emperor of Russia. Her greatest success is generally considered to be in the part of Marguerite in Gounod's *Faust.* In May, 1868, she married the marquis de Caux, from whom she was divorced in 1885, and married Ernesto Nicolini in 1886.

PATTI (MUNCK), CARLOTTA, sister of ADELINA, b. 1840, a leading singer of her time, though a slight degree of lameness prevented her from appearing much in opera. Her voice was a soprano of unusual compass, and of a clear silvery quality, and much power in the upper register. Her peculiarly high notes, and a graceful *abandon* of manner, brought her into favor with the public, though in quality of tone she did not equal her sister. She made her *début* in London in 1863, but had for some time before been in the enjoyment of a high reputation in the United States. She d. 1889.

PATTISON, DOROTHY WYNDLOW (SISTER DORA), 1832–78; b. England; daughter of Rev. Mark James Pattison, rector of Hauxwell. In 1864 she joined a sisterhood of the Anglican church, and as "Sister Dora" served as nurse in the cottage hospital at North Ormesby, and afterwards in that at Walsall, Staffordshire, finally taking sole charge of the institution. Her wonderful courage, zeal, ability, and success are well described in *Sister Dora; a Biography*, by Margaret Lonsdale.

PATTISON, MARK, 1813–84; b. Yorkshire, England; graduated, 1836, at Oriel college, and was elected fellow of Lincoln college, 1840. In 1861 he became director of that college. During the latter part of his life he gave much of his time to writing upon literary and philosophical subjects. In 1860 he published *Tendencies of Religious Thought in England (1688–1750)*; *Life of Isaac Casaubon* (1875); *Life of Milton* (1880); *Milton's Sonnets, with Notes* (1882).

PATTISON, ROBERT EMORY, b. near Snow Hill, Somerset co., Md. 1850; son of Robert H. Pattison, a popular Methodist minister. He was educated in the public schools of Philadelphia, and admitted to the bar of that city, 1872. In 1877 he was elected city controller, and proved so efficient and courageous in his resistance of corrupt municipal combinations, that he easily secured a re-election in 1881. He was elected gov. of Penn. in 1882 and 1890.

PATTISON, ROBERT EVERETT, D.D., 1800–74; b. Vt.; graduated at Amherst college, 1830; was tutor in Columbian univ., Washington, D. C.; ordained as a Baptist minister at Salem, Mass., 1829; and settled, in 1830, pastor of the First Baptist church in Providence, R. I. In 1836 he was elected president of Waterville college, Maine, retaining the position until 1840, when he returned to his former pastorate in Providence. In 1846 he became professor in the theological seminary at Covington, Ky. In 1848 he was elected professor of theology in the Newton theological institution, Massachusetts, and in 1853 was again president of Waterville college. Subsequently he held other collegiate positions. He was the author of *Commentary on the Epistle to the Ephesians* (Boston, 1859).

PATTON, FRANCIS LANDEY, D.D., LL.D.; b. Warwick, Bermuda, 1843. His family removed to Toronto, Canada. He was educated at University and Knox colleges, Toronto; graduated at Princeton, N. J., theolog. seminary, 1865; was pastor of Presbyterian churches in New York, Nyack, and Brooklyn, 1865–71; prof. didactic and polemical theology in Pres. theolog. seminary, Chicago, 1871–81; editor of *The Interior*, 1873–76; pastor Jefferson Park Pres. church, 1874–81; and active in prosecuting Prof. Swing for heresy; in 1878 moderator of Pres. general assembly; in 1881 became Stuart prof. in Princeton, N. J., theolog. seminary, and prof. of ethics in Princeton coll., of which he was elected president, 1888. He is an editor of *The Princeton Review*, and has published *Inspiration of the Scriptures* (1869); *Summary of Christian Doctrine* (1874).

PATUXENT, a river of Maryland, rises 18 m. e. of Frederick, and, after a southeasterly course of 90 m., empties by a broad estuary into Chesapeake bay; navigable for small vessels for 50 miles.

PAU, a flourishing t. of France, capital of the department of Basses-Pyrénées, on the right bank of the Gave-de-Pau, 105 m. s.s.e. of Bordeaux. It occupies a rocky height, cloven into two portions by a ravine through which a streamlet flows into the Gave-de-Pau, and united by a high bridge. Toward the s. it commands most magnificent views of the western Pyrenees; indeed, for mountain views its situation is hardly surpassed by that of any town in France. As seen from this town, the distant Pyrenees rise in peaks, cones, and serrated ridges, and present an outline as varied as it is strikingly beautiful. The town contains a palace of justice, a promenade, royal square, with a bronze statue of Henri IV., beautiful theater, university-academy, museum, and library of 25,000 vols. Linen and cloth manufactures are the chief branches of industry; in the vicinity Jurançon wine (good but strong) is grown. Many swine are fed in the vicinity, and from the pork the famous *Jambons de Bayonne* are made. Pau is a favorite resort of the English, especially during winter, and is a general rendezvous for those who wish to explore the Pyrenees. Pop. '96, 33,012.

PAUCHONTI TREE, *Isonandra polyandra*, a large forest-tree, of the same genus with the gutta-percha tree, and producing a substance similar to gutta-percha, abundant in some of the forests at the base of the western Ghauts in India.

PAUL, the great apostle of the Gentiles, was born of Jewish parents at Tarsus, in Cilicia, and inherited from them the rights of Roman citizenship. His original name was Saul. He was educated first in his native city, then in the zenith of its reputation for its schools of literature and philosophy, where he doubtless learned to speak and write Greek; and afterwards, to be perfected "in the law of his fathers," was sent to Jerusalem, where he studied under Gamaliel, a great Jewish doctor, and became one of

the strictest, most zealous, and most ardent Pharisees. Whether it was here or at Tarsus that he acquired his knowledge—which we have no reason to believe was ever very deep—of the philosophy and literature of Greece, cannot be ascertained. According to the wholesome rule observed among the Jews, that every person should learn some trade, Saul became a tent-maker, and at this trade he afterwards labored (Acts xviii. 3) for his support. A few years after the death of Jesus, he became, as might have been expected from his training and temperament, a furious adversary of the new sect of Christians. We are told (Acts vi. 9) that the Jews of the Cilician synagogue at Jerusalem were among those who disputed with Stephen, and it is natural to suppose that the young and brilliant zealot, eager for disputation, was conspicuous among the crowd of Jewish students who poured out of their synagogues (of which, according to the Talmud, there were 480 in the holy city), in the insolence of their youth and scholarship, to crush the ignorant followers of the Nazarene. This supposition is rendered highly probable by the fact that he was present at the martyrdom of Stephen, which followed almost immediately, having charge of the raiment of them that slew him. He now became a prominent actor in the great persecution of the Christians that broke out at Jerusalem. The mysterious circumstances that led to and attended his conversion are familiar to all readers of the Acts of the Apostles, and need not be recapitulated here. After a solitary sojourn in Arabia—perhaps to calm his perturbed spirit in communion with God, and to solemnly prepare himself for his new mode of life—on his return to Damascus, he changed his name to Paul, and resumed or began (it is not quite clear which) his apostolic labors. Naturally he became an object of intense hostility to the unbelieving Jews in that city. They resolved to kill him; but his friends contrived a way of escape, and he fled to Jerusalem, where at first he was received with suspicion by the disciples, but afterwards, through the kind offices of Barnabas, with great cordiality. He now "spoke boldly in the name of Christ," disputing also against the "Grecians"—i.e., the Hellenistic Jews—with dangerous success, for his opponents sought to take his life. Again he was obliged to flee, and betook himself to his birthplace, Tarsus, where he seems to have remained till Barnabas brought him to Antioch (not far off), to assist in the great work of evangelization going on in that city. After a short visit to Jerusalem in the year of the famine, 44 A.D., they were set apart by the prophets and elders of the church at Antioch for the evangelization of the more distant Jews. From Seleucia they proceeded on their first missionary expedition to the southern districts of Asia Minor, Pamphylia, Pisidia, and Lycaonia, where they met, especially in some places, with considerable success, in preaching the gospel. It is very interesting to notice how gradually the light of Christianity dawned on the mind of the apostle. He did not grasp all at once its grand design. It was not even by abstract reflection that he arrived at it. Circumstances of quite an outward sort forced him to the sublime conclusions of his creed. It was when the Jews of Pisidian Antioch, enraged at his preaching the gospel indiscriminately to their Gentile fellow-townsmen and themselves, "contradicted and blasphemed" him, that he boldly announced Christ as the universal Redeemer. After the return of Paul and Barnabas to Antioch, they continued to labor in that city for a long time, till dissensions having arisen about the circumcision of Gentile converts, he, along with Barnabas and others, was chosen to go up to Jerusalem, to get the opinion of the apostles and elders there on the question, about 51 A.D. Paul and Barnabas now returned to Antioch, where they continued to teach and preach, till a yearning grew up in the heart of the former to revisit his Gentile converts in Asia Minor. In his second expedition, Paul was accompanied by Silas instead of Barnabas, and traversed the whole of Asia Minor from south to north, evangelizing with great success, after which the two missionaries crossed the Ægean and landed in Europe, planting at Philippi, the capital of Thracian Macedonia, the first Christian church in that continent. The details of his visits to Thessalonica, Berea, Athens, and Corinth are, doubtless, familiar to our readers, and need not be given here. We can only notice his appearance at Athens, where, on Mars's hill, before a crowd of the citizens, among whom were Epicurean and Stoic philosophers, he delivered that magnificent discourse in which he declared to the Athenians the character of the "unknown" God. On his return to Asia Minor he visited Ephesus, where, as usual, he "reasoned" with the Jews in their synagogue; sailed thence to Cæsarea, in Palestine, and proceeded to Jerusalem "to keep the feast;" after which he again returned to Antioch, the center from which his operations radiated. Thus closed his *second* evangelistic journey. The third journey of Paul commenced probably about 54 A.D., and extended over much the same district as the previous one. At Ephesus, where he remained for a period of two years and three months, his efforts were powerfully seconded by the eloquence of the great Alexandrian convert, Apollos. Here it is recorded (Acts xix.) that "God wrought special miracles by the hand of Paul, so that from his body were brought unto the sick handkerchiefs or aprons, and the diseases departed from them, and the evil spirits went out of them." In explanation of this very curious procedure, which has a disagreeable resemblance to ordinary legerdemain, it has been suggested, that as Ephesus was a city noted for its exorcisms, spells, and incantations—the famous *Ephesia Grammata* sold at a high price to the ignorant and superstitious populace—this style of miracle was an accommodation to their belief in magic and demonism, and intended to show them, according to their own way of regarding things, the superiority of Christ's power to that of the evil spirits of heathen worship.

From Ephesus Paul went up to Jerusalem with a presentiment that heavy evils were about to fall upon him through the ever-maddening malice of the Jews. The Jewish populace were goaded into the wildest fury by the very sight of Paul. The capt. of the Roman guard, Claudius Lysias, had to interfere to save him from being torn to pieces; but as 40 Pharisees had sworn neither to eat nor drink till they had taken his life, he was sent by night, under a strong escort, to the Roman governor Felix, at Cæsarea, where he was unjustly detained a prisoner for two years. Having finally appealed to the Roman emperor, according to the privilege of a Roman citizen, he was sent to Rome. On the voyage thither he suffered shipwreck at Melita (probably Malta), in the spring of 61 A.D. At Rome he was treated with respect, being allowed to dwell "for two whole years in his own hired house." His first thoughts were, as usual, directed towards his Jewish brethren in the city; but, on the whole, he made little impression on them. Whether he ever left the city or not cannot be positively demonstrated, but it is believed by many critics, from a variety of considerations, that he did obtain his liberty about 64 A.D., and that he made journeys both to the e. and to the w., revisiting Asia Minor, and carrying out his long-cherished wish of preaching the gospel in Spain. Meanwhile occured the mysterious burning of Rome, generally attributed to Nero, who threw the blame on the Christians, and in consequence subjected them to a severe persecution. Among the victims was Paul, who, according to tradition, suffered, 67 A.D.—See *Life and Epistles of St. Paul*, by Conybeare and Howson; Baur's *Paulus;* Lipsius, *Der Apostel Paulus* (1869); Renan, *Saint Paul* (1869); Pfleiderer, *Der Paulinismus* (1873; transl. 1878); Farrar's *St. Paul*, 1879.

PAUL, the name of five popes, of whom the following appear to call for special notice. —PAUL III., whose pontificate falls upon one of the most critical periods in the history of the church, was originally named Alessandro Farnese, and was born at Carino, in Tuscany, in 1468. Having been created cardinal he served in several important trusts, and eventually became bishop of Ostia and dean of the Sacred college. On the death of Clement VII. in 1534, he was elected pope, just at the crisis when the world was alive with expectation of the general council which was to decide all the controversies at that time agitating the public mind of Europe. After some delays Paul convoked the council to meet at Mantua in 1542; but it did not actually assemble (in Trent) until 1545. These delays are by some charged upon Paul; but it can hardly be doubted that much of it was due to the difficulties of the times. The bull of excommunication and deposition which he issued in 1538 against Henry VIII. of England is one of the last examples of the exercise of the temporal power claimed by the mediæval popes. In the contest of Charles V. with the Protestant league in Germany, Paul sent a large force to support him, and he opposed the pacification proposed by the emperor upon the basis of the interim (q.v.). Paul's conduct in aggrandizing the fortune of his son, Pietro Luigi Farnese, has been severely criticised by historians; the more so, that this son was born out of wedlock, in the early youth of his father. Paul died, Nov. 10, 1549, in his 82d year.—PAUL IV., named John Peter Caraffa, a member of the noble family of that name, was born in Naples in 1476. His early career was distinguished for ascetic rigor. He was appointed bishop of Chieti, in which see he labored most earnestly for the reformation of abuses, and for the revival of religion and morality. With this view he established, in conjunction with several congenial reformers, the congregation of secular clergy called theatines (q.v.), and was himself the first superior. It was under his influence that Paul III. organized the tribunal of the inquisition in Rome. On the death of Marcellus II. in 1555, although in his 79th year, he was elected to succeed. He entered upon the wider career of reformation which his new position opened for him with all the ardor of a young man, and with all the stern enthusiasm which had characterized him during life. He enforced vigorously upon the clergy the observance of all the clerical duties, and enacted laws for the maintenance of public morality. He established a censorship, and completed the organization of the Roman inquisition; he took measures for the alleviation of the burdens of the poorer classes, and for the better administration of justice, not sparing even his own nephews, whom he banished from Rome on account of their corrupt conduct and profligate life. His foreign relations, too, involved him in much labor and perplexity. He was embroiled with the emperor Ferdinand, with Philip II. of Spain, with Cosmo, grand duke of Tuscany. Having condemned the principles of the peace of Augsburg, he protested against its provisions. Under the weight of so many cares, his great age gave way. He died, Aug. 18, 1559, in his 84th year. At his death the populace broke out into an insurrectionary tumult, which lasted till the conclave for the appointment of his successor.—PAUL V., originally named Camillo Borghese, was born in Rome in 1552. In his early life he was a distinguished canonist and theologian; and after the ordinary prelatical career at Rome he rose first to the post of nuncio at the Spanish court, and afterwards to the cardinalate under Clement VIII. On the death of Leo XI., in 1605, cardinal Borghese was elected to succeed him. His pontificate is rendered memorable by the celebrated conflict with the republic of Venice, into which he was plunged at the very outset of his career. The original ground of dispute was the question of the immunity from the jurisdiction of civil tribunals conceded to the clergy, who claimed to be tried by ecclesiastical tribunals alone. This claim the senate resisted; and further causes of dispute were added by a mortmain law, and a law prohibiting the estab-

lishment of new religious orders or associations unless with the sanction of the senate. Each party remaining inflexible in its determination, Paul issued a brief, directing a sentence of excommunication against the doge and senate, and placing the republic under an interdict unless submission should be made within twenty-four days. The senate persisted, and an animated conflict, as well of acts as of writings, ensued, in the latter of which the celebrated Fra Paolo Sarpi, on the side of the republic, and on the papal side, Bellarmino and Baronius, were the leaders. Preparations were even made for actual hostilities; but, by the intervention of Henry IV. of France, the dispute was accommodated and peace restored in 1607, although dissatisfaction afterwards arose on the subject of the nomination of a patriarch. Paul, whose administration was a vigorous and noble one, died Jan. 28th, 1621.

PAUL, Hermann, philologist, was born in Magdeburg in 1846; studied at Berlin and Leipzig, and in 1874 became Professor in the University of Freiburg. His publications comprise *Gab es eine mittelhochdeutsche Schriftsprache?* (1873); *Zur Lautverschiebung* (1874); *Kritische Beiträge zu den Minnesingern* (1876); *Zur Nibelungenfrage* (1877); *Mittelhochdeutsche Grammatik* (1884). He is best known in the United States by his *Prinzipien der Sprachgeschichte*, (1880; second ed., 1886), which has been translated into English by Prof. Strong (1888), and retranslated with changes by Professors Strong, Logeman, and Wheeler (1891).

PAUL (Petrowitsch), Emperor of Russia, the second son of the unfortunate Peter III. and the empress Catherine II., was b. in 1754, became heir-apparent on the death of his elder brother in 1763, and succeeded his mother on the imperial throne in 1796. The tragical death of his father when he was still a child, and the neglect and want of confidence with which his mother treated him, exerted a baneful influence on the character of Paul, who was kept in compulsory seclusion while Catharine shared the administration of the government with her favorites. In 1776 Paul, on the death of his first wife, a princess of Hesse-Darmstadt, married the princess Dorothea of Würtemberg, by whom he had four sons—the late emperors Alexander and Nicholas, and the grand dukes Constantine and Michael, and several daughters. After spending some years in traveling with his wife through Germany, France, and Italy, Paul was recalled by his mother, who assigned to him the palace of Gatchina, 30 m. from St. Petersburg, as his settled residence, while she took his children under her own immediate care. The death of the empress in 1796 released him from his unnatural restraint, and he ascended the throne with no practical acquaintance with the mechanism of government, and no knowledge of the people whom he was called to rule over. A determination to change everything that had existed under the previous reign, and to wreak vengeance on the murderers of his father, were the predominating influences that guided his actions; and his earliest measures, which were the disgrace of his father's murderers, and the pardon of all Polish prisoners, gave hopes of a good reign; but the capricious violence of character and incapacity for business which Paul betrayed, soon disappointed the hopes that he had awakened. No department of the state was free from his frivolous interference, and no class of the nation exempt from the effect of his arbitrary legislation. While he irritated the soldiery by vexatious regulations in regard to their dress, he offended the nobles by imperious enactments as to the ceremonials to be observed in his presence. His foreign policy was marked with similar caprice. After having adopted a system of neutrality in the war between France and the rest of Europe, he suddenly declared in favor of the allied powers, and sent an army of 56,000 men under Suwaroff into Italy. The success of his general encouraged him to send a second army of equal strength to co-operate with the Austrians; but their defeat in 1799 induced Paul to recall Suwaroff with the Russian troops; and having retired from the allied coalition without having given any reason for his conduct, he quarreled with England, because she would not comply with his whimsical demand for the surrender of Malta, and his own recognition as grand master of the order of Malta, and entered into a close alliance with Bonaparte, who was then first consul. The jealousy and hatred of England by which both were actuated, proved a powerful bond of union between them; and in furtherance of their scheme of uniting all the smaller maritime powers into one vast confederation against England, Paul concluded a convention with Sweden and Denmark for the purpose of opposing the right insisted on by England of searching neutral vessels. The result was that the English government sent a fleet into the Baltic under Nelson to dissolve the coalition, at the close of March, 1801. Paul was preparing to give material aid to the Danes, when a conspiracy was formed at St. Petersburg to put a stop to the capricious despotism under which all classes of men in Russia were groaning. The conspirators, whose numbers included count Pahlen, the most influential man at court, gen. Beningsen, Uwarow, and many other distinguished nobles and officers, appear originally to have intended only to force Paul to abdicate, but his obstinate disposition led to a scuffle, in which the emperor was strangled, Mar. 24, 1801.

PAUL I., Pope, d. 767; b. Rome; brother of Stephen III., whom he succeeded 757. He was the candidate of the Frankish party, which was opposed by the Italian party, who presented Theophylactus for the vacancy; and the latter at first refused to acknowledge him, but finally submitted. He secured the favor of Pepin I., as a protection against the Byzantines and Lombards. He strengthened the papal power, and in 766 was reconciled to Desiderius, king of the Lombards, who endowed the church with some of his property. His anniversary is June 28.

PAUL II., Pope, born Italy, 1418; nephew of Eugenius III. His name was Pietro Barbo, and he had been archdeacon of Bologna, and bishop of Cervia before his elevation to the pontificate in 1464. At the beginning of his reign he reformed a number of abuses in the papal court, and attempted to form a general alliance of Christian sovereigns against the Turks. His relations with many of those sovereigns were unfriendly. He demanded from Louis XI. the revocation of the pragmatic sanction, attacked Podiebrad, king of Bohemia, as a Hussite, and caused a civil war in that country, and quarreled with Ferdinand in regard to some fiefs in Naples. In 1468, after the capture of Negropont by the Turks, he ordered a general peace throughout Italy, on pain of excommunication, but he died before the arrangements for a combined campaign against the Turks had been completed. He d. 1471.

PAUL OF SAMOSATA, so called from his native city; b. early in the 3d century. Concerning his childhood and youth little is known. He was at first a sophist and obtained admittance among the clergy in some unknown way. He became bishop of Antioch, 260 **A.D.**, probably through the influence of Zenobia, queen of Palmyra, who admired his learning and genius. His enemies assert, but without proof, that his character previous to his appointment was in some respects unworthy of the episcopal office. After his elevation, if the current accounts are to be trusted, he was rapacious, arrogant, and vain. In addition to his spiritual office, he obtained the secular appointment of procurator, which, yielding him large emoluments, prompted him to surround himself in the church with greater pomp and ceremonial than had hitherto been witnessed. He built an episcopal judgment seat and a lofty throne which were screened from public view. He traveled, attended by a large retinue, reading letters and dictating answers along the road to display his manifold and urgent engagements. During public worship he allowed persons of both sexes to applaud him according to the custom in theaters. In his preaching he freely denounced others, and praised himself more, as Eusebius says, "after the manner of a rhetorician, or a mountebank, than of a bishop." He allowed praises of himself to be sung publicly in church during the Easter services, and encouraged bishops of less important cities around him to extol him in their sermons as an angel from heaven. Besides these definite charges he was under suspicion of others more secret. His theological heresies, which closely resemble those of Sabellius, aroused more opposition against him than his notorious faults or suspected crimes. Over his wickedness many declared that "they groaned in secret, yet feared to accuse him, but when he set himself in opposition to God they were compelled to depose him, and elect another bishop in his place." Several councils were convened to consider his case; by the last of which, held about 269 **A.D.**, he was divested of his office and excommunicated. Trusting to the favor both of Queen Zenobia and of the populace, he refused to vacate the episcopal residence, in which also the meetings of the church were held. In 272 the emperor Aurelian, having conquered Zenobia, referred Paul's case to the bishops of Rome and of Italy. They decided against him. There is no notice either of the time or place of his death.

PAUL, VINCENT DE, one of the most illustrious saints of the Roman Catholic church, was born of humble parentage at Pouy, in Gascony, in the year 1577. The indications of ability which he exhibited led to his being sent to school at Toulouse. He became an ecclesiastical student, and was admitted to priest's orders in 1600. On a voyage which he was making from Marseilles to Narbonne his ship was captured by corsairs, and he with his companions sold into slavery at Tunis, where he passed through the hands of three different masters. The last of these, who was a renegade Savoyard, yielded to the exhortations of Vincent, resolved to return to the Christian faith, and, with Vincent, made his escape from Barbary. They landed in France in 1607. Having gone thence to Rome, he was intrusted with an important mission to the French court in 1608, and continued for some time to reside in Paris as the almoner of Marguerite de Valois. The accident of his becoming preceptor of the children of M. de Gondy, the commandant of the galleys at Marseilles, led to his being appointed almoner-general of the galleys in 1619. It was at this time that the well-known incident occurred of his offering himself, and being accepted, in the place of one of the convicts, whom he found overwhelmed with grief and despair at having been obliged to leave his wife and family in extreme destitution. Meanwhile he had laid the foundation of what eventually grew into the great and influential congregation of priests of the missions, an association of priests who devote themselves to the work of assisting the parochial clergy by preaching and hearing confessions periodically in those districts to which they may be invited by the local pastors. The rules of this congregation were finally approved by Urban VIII. in 1632; and in the following year the fathers established themselves in the so-called priory of St. Lazare, in Paris, whence their name of *Lazarists* is derived. From this date his life was devoted to the organization of works of charity and benevolence. To him Paris owes the establishment of the foundling hospital, and the first systematic efforts for the preservation of the lives, and the due education of a class theretofore neglected or left to the operation of chance charity. The pious sisterhood of charity is an emanation of the same spirit, and Vincent was intrusted by St. Francis of Sales with the direction of the newly-founded order of sisters of the Visitation. The queen, Anne of Austria, warmly rewarded his exertions, and

Louis XIII. chose him as his spiritual assistant in his last illness. He was placed by the queen-regent at the head of the *conseil de conscience*, the council chiefly charged with the direction of the crown in ecclesiastical affairs; and the period of his presidency was long looked back to as the golden era of impartial and honest distribution of ecclesiastical patronage in France. Vincent was not, in any sense of the word, a scholar, but his preaching, which (like that of the fathers of his congregation of Lazarists) was of the most simple kind, was singularly affecting and impressive. He left nothing behind him but the *Rules or Constitutions of the Congregation of the Mission*, 1658; *Conferences* on these constitutions, 4to; and a considerable number of letters, chiefly addressed to the priests of the mission, or to other friends, on spiritual subjects. He died at the advanced age of 85, at St. Lazare, Sept. 27, 1660, and was canonized by Clement XII. in 1737. His festival is held on July 19, the day of his canonization.

PAULDING, a co. in n.w. Georgia, drained by the Tallapoosa and Etowah rivers; 340 sq.m.; pop., '90, 11,948, chiefly of American birth, with colored. The surface is uneven and hilly, and the soil only fairly fertile; Indian corn, cotton, and pork are the chief products. There are extensive forests of pine and several kinds of oak. Co. seat, Dallas.

PAULDING, a co. in n.w. Ohio; bounded on the w. by Indiana; drained by the Maumee and Auglaize rivers and several creeks; intersected by the Wabash, and the Cincinnati, Jackson, and Mackinaw railroads; about 414 sq. m.; pop. '90, 25,932, chiefly of American birth. The surface is level and much of it is morass. Oats, hay, Indian corn, and wheat are the staples. Co. seat, Paulding.

PAULDING, Hiram, 1797–1878; b. N. Y.; son of John Paulding, one of the American soldiers who captured André; entered the Navy, Sept. 1, 1811; served with distinction under Commodore Macdonough in the battle of lake Champlain, and received a sword from congress in recognition of his services; he was made lieutenant, 1816; afterwards master commander; and in 1823 accompanied navy commissioner David Porter on a successful expedition to suppress piracy in the gulf of Mexico. In 1844 he was raised to the rank of captain, and in command of the *Vincennes* cruised in the West Indies. He captured Gen. William Walker the filibuster, on his second landing at Punta Arenas, Nicaragua. In Dec., 1860, he was presented with a sword by the republic of Nicaragua, in acknowledgment of his services, and received an offer of a tract of land, which he was not permitted by the U. S. senate to accept, but instead was censured by President Buchanan, who released Gen. Walker. In April, 1861, he was commander of the Norfolk navy yard, and in 1861 he was made rear-admiral on the retired list. In 1862–65 he was in command at the Brooklyn navy yard, and in 1866 was appointed governor of the Philadelphia naval asylum. In 1831 he published a *Journal of a Cruise among the Islands of the Pacific*. He was port admiral at Boston, 1869–71.

PAULDING, James Kirke, an American author, was born in Dutchess co., N. Y., Aug. 22, 1779. His father was a farmer, descended from the early Dutch settlers. Self-educated, and early developing a tendency to literature, he was a friend of Washington Irving, and wrote a portion of *Salmagundi*. During the war of 1812 he published the *Diverting History of John Bull and Brother Jonathan;* in 1813, a parody of the *Lay of the Last Minstrel*, entitled *A Lay of the Scottish Fiddle;* and in 1814, a more serious work, *The United States and England*, a defense against articles in the *Quarterly Review*. This work attracted to him the attention of President Madison, and caused him to be appointed a member of the board of naval commissioners. In 1816 he published a defense of the southern states and of slavery in *Letters from the South, by a Northern Man;* in 1819, a new series of *Salmagundi;* in 1822, *A Sketch of Old England, by a New England Man;* and in 1824, *John Bull in America, or the New Munchausen*, a satire on the writings of certain British tourists. This was followed by *Konigsmarke*, a novel (1825); *Merry Tales of the Three Wise Men of Gotham* (1826); *The New Pilgrim's Progress* (1828); *Tales of a Good Woman* (1829); *Book of St. Nicholas* (1830). These works, mostly humorous and satirical, had various degrees of local popularity; but in 1831 he produced *The Dutchman's Fireside*, a novel that was reprinted in England, and translated into French and Dutch; and in 1832, *Westward Ho!* which attained to a similar popularity. These were followed by a *Life of Washington* (1835), *Slavery in the United States* (1836), in which the institution is defended on social, economical, and physiological grounds. He held at this period the lucrative post of navy agent of New York, and was by Mr. Van Buren appointed secretary of the navy, which gave him the position of cabinet minister. At the close of Mr. Van Buren's presidency in 1841, Mr. Paulding retired to a country residence at Hyde Park, N. Y., where he wrote *The Old Continental*, a novel (1846); *The Puritan and his Daughter* (1849); and with his son, a volume of Plays and Fairy Tales. He died at Hyde Park, New York state, April 6, 1860.

PAULDING, John, 1758–1818; b. N. Y., a revolutionary soldier who served through the war, taken prisoner three times; one of those who captured Maj. André, 1780, receiving for the service a silver medal from congress, bearing the inscription *Fidelity*, on one side, and on the reverse *Vincit amor patriæ*. In 1827 the city of New York erected a monument to his memory at Peekskill, where he was buried; and he

as well as his comrades in the capture, Van Wart and Williams, have had counties in Ohio named in their honor.

PAULI'CIANS, an ancient sect of the eastern empire, who, by Catholic writers, are reckoned an offshoot of the Manichæans (q.v.). According to Peter of Sicily and Photius, the sect originated in Armenia from two brothers, named Paul (from whom it is alleged to have received its name) and John, who flourished in the 4th century. Others trace it to an Armenian named Paul, who lived under Justinian II. The Paulicians were at all times treated with much suspicion, and repressed with great severity, by the eastern emperors; Constans, Justinian II., and Leo the Isaurian especially labored to repress them, and indeed, with the exception of Nicephorus Logotheta (802–811), it may be said that all the emperors, with more or less rigor, persecuted them. Their greatest enemy, however, was Theodora (841–855), who, having ordered that they should be compelled to return to the Greek church, had all the recusants cruelly put to the sword or driven into exile. A bloody resistance, and finally an emigration into the Saracen territory, was the consequence; and it is from the Paulician settlers in Bulgaria (Catholic historians) that the Manichæan doctrines which tinged the opinions of most of the mediæval sects are supposed by Roman Catholic historians to have found their way into the eastern provinces of the western empire. Even so late as the 17th c., according to Mosheim (ii. 238), there was a remnant of this sect existing in Bulgaria.

It is proper, however, to notice that a very different view of the character and doctrines of the Paulicians has been advocated by such modern writers on ecclesiastical history as Gieseler and Neander, according to whom they had their origin from one Constantine of Mananalis (near Samosata), an Armenian, who had received a present of two volumes—one containing the four gospels, and the other the epistles of Paul—and who afterwards assumed the name of Paul, in testimony of his great veneration for that apostle. The distinctive characters of his doctrine and that of his followers were the rejection of the worship of the Virgin, the saints, and the cross, the denial of the material presence of Christ in the eucharist, and the assertion of a right freely to search the Scriptures; and the charge of Manichæism was falsely brought against them by their persecutors.

PAULINUS, Saint, d. 644; sent to England by Pope Gregory I. in 601. In 625 he was made bishop by Justus the archbishop, and went to Northumbria, in attendance on Æthelburga, daughter of Æthelbert, king of Kent, and wife of Edwin, king of Northumbria. In 627 King Edwin, with many others, was baptized. Soon afterwards Paulinus was consecrated archbishop of York, founded the cathredral, and in 631 ordained Honorius archbishop of Canterbury. On the death of King Edwin in 633 the Northumbrians relapsed into heathenism, and Paulinus fled to Kent, where he was raised to the see of Rochester.

PAULINUS, Pontius Mesopius Anicius, Saint, 353–431, b. France; a pupil of the poet Ausonius, who secured him the favor of the emperor Gratian. He attained the dignity of *consul suffectus*, and was married to a wealthy lady named Therasia. Through the efforts of St. Ambrose he was converted to Christianity, distributed most of his property among the poor, and continued, for a time, to reside in Spain. He was ordained a presbyter in 393, at Barcelona, but soon left Spain for Rome. On his way he was warmly received by St. Ambrose at Florence. He failed to win the favor of pope Siricius, who regarded his ordination as irregular. In 394 he went to Nola, where he had an estate. Near the city was the tomb of the martyr Felix, over which a church had been built, and a few cells for pilgrims. Here Paulinus lived for fifteen years in a strict monastic fashion, except that his wife seems to have been with him. In 409 he was made bishop of Nola, a position which he retained till his death. He was present at the council of Ravenna in 419. Of his works there have been preserved 50 epistles, 32 poems, and a tract called *Passio S. Genesii Arelatensis.* His name is of frequent occurrence in the letters of Augustine and Jerome.

PAULIST FATHERS, a society of missionary priests of the Roman Catholic church, founded in New York in 1858 by the Rev. Isaac T. Hecker and some other priests. It is called the congregation of the missionary priests of St. Paul the apostle. Hecker and his associates belonged to the order of the Redemptorists engaged in home mission work in New York, but desired to form an organization composed chiefly of those whose native tongue was English. Archbishop Hughes approved, and Pius IX sanctioned, the plan. The congregation reports a growing number of houses and churches in many localities, and several students preparing for the ministry. The Paulists originated the Catholic publication society, and the monthly periodical *The Catholic World.* Hecker, Stone, and Hewitt have published several theological works. These priests are very earnest in their preaching, holding "missions," which correspond to revival services in Protestant churches.

PAULLI'NIA. See Guarana Bread.

PAULOWNIA, the common, and also generic name of an ornamental tree brought from Japan in 1840, named in honor of the princess Anna Paulovna of the Netherlands, afterwards queen. It belongs to the order *Scrophulariaceæ* or figwort family, of which it is a remarkable member, attaining a height of 20 to 30 feet. It has somewhat the appear-

ance of a catalpa, the leaves being similar, but much more downy. The flowers make their appearance in April and May. They are somewhat cylindrical, with rounded lobes at the mouth, and clustered in large panicles. Each flower is from one and a half to two inches long, of a beautiful violet color, and having a slight agreeable odor. Calyx, fine, segmented, thick, and leathery, densely covered with a rusty down. Capsules 2-valved, ovate, and pointed, an inch or more in length, containing numerous small, winged seeds. The tree was at one time much sought after in the United States, as it was preceded by a great reputation, but it has since fallen somewhat from its high favor. It is not hardy north of New York, and even there and further south it often fails to bloom for several seasons in succession. The flower buds are formed in the previous season, a severe winter generally blights them, and the tree is not ornamental without its flowers. The growth of the tree in a favorable climate is very rapid and vigorous, and the leaves are remarkable for their size and fine appearance, often measuring two feet in breadth on young trees. It is said that a good way to cultivate the tree is to cut it down to the ground every year and use it as a sort of hedge or division, the young shoots growing very rapidly and becoming ornamental on account of their luxuriant leaves.

PAULUS, Heinrich Eberhard Gottlob, a German theologian of great note in his day, and one of the leaders of the Rationalists at the close of the last and the first quarter of the present c., was b. at Leonberg, near Stuttgart, Sept. 1, 1761. He gave himself to the study of oriental languages at Göttingen, and afterwards prosecuted it in London and Paris. In 1789, he was called to the professorship of oriental languages at Jena, and in 1793 became professor of geology, on the death of Döderlein. Here he especially signalized himself by the critical elucidation of the Scriptures of the Old and New Testament, in so far as they presented oriental characteristics. The results of his labors may be seen in his *Philologisch-kritischen und historischen Commentar über das Neue Testament* (4 vols. Lüb. 1800–4); *Clavis über die Psalmen* (Jena, 1791); *Clavis über den Jesaias*, and other writings belonging to this period of his literary activity. In 1803 he removed to Würzburg; in 1808, to Bamberg; in 1809, to Nuremberg; and in 1811, to Ansbach. During these various changes he had ceased to be a professor, and become a director of ecclesiastical and educational affairs; but in 1811 he accepted the professorship of exegesis and ecclesiastical history at Heidelberg. In 1819 he started a kind of historico-political journal entitled *Sophronizon*, in which he continued to write for about ten years. His contributions were marked by weighty sense, moderation, and knowledge of his various subjects, and won him great applause at the time. As a theologian, he is generally looked upon as the type of pure unmitigated rationalism—a man who sat down to examine the Bible with the profound conviction that everything in it represented as supernatural was only natural or fabulous, and that true criticism consisted in endeavoring to prove this. From his numerous writings, we select for mention the following: *Memorabilien* (Leip. 1791–96); *Sammlung der merkwurdigsten Reisen in den Orient* (7 vols. Jena, 1792–1803); *Leben Jesu als Grundlage einer reinen Geschichte des Urchristenthums* (2 vols. Heidelb. 1828); *Aufklärende Beiträge zur Dogmen-Kirchenund Religionsgeschichte* (Bremen, 1830); and *Exegetisches Handbuch über die drei ersten Evangelien* (3 vols. Heidelb. 1830–33). Paulus died, Aug. 10, 1851, at the advanced age of 90—having lived long enough to see his own rationalistic theory of Scripture give place to the "mythical" theory of Strauss, and that in its turn to be shaken to its foundations partly by the efforts of the Tübingen school, and partly by those of Neander and the "broad church" divines of Germany. See Paulus's *Skizzen aus meiner Bildungs-und Lebensgeschichte zum Andenken an mein 50-jähriges Jubiläum* (Heidelb. 1829), and Reichlin Meldegg's *H. E., G. Paulus und Seine Zeit* (2 vols. Stuttg. 1853).

PAU'LUS ÆGINE'TA, a celebrated Greek physician, was b. in the island of Ægina, and flourished during the conquests of the caliph Omar in the 7th century. Of his life we know almost nothing more than that he pursued his medical studies first at Alexandria, and afterwards in Greece and other countries. His forte lay in surgery and obstetrics, in the latter of which departments of medicine his practice was great. He abridged the works of Galen, and was deeply read in those of Ætius and Oribasius, while he always exercised an independent judgment in forming his conclusions. His descriptions of diseases are brief and succinct, and also complete and exact. He often grounds his explanation of morbid phenomena on Galen's theory of the cardinal humors; while in surgery his writings abound with novel and ingenious views. His works—the principal of which is commonly called *De Re Medica Libri Septem* (Lond. 1834)—have passed through many editions, of which the best is that completed at Lyons in 1567, and they have also had many translators, of whom the best in English is Dr. Francis Adams.

PAULUS DIACONUS (also called Paulus Levita, both surnames being derived from his ecclesiastical office), one of the most learned men of his time, and the greatest Lombard historian, was born of a noble Lombard family at Friuli about 725. His father's name was Warnefrid. He received a superior education at Pavia, at the court of the Lombard king Ratchis, and appears to have continued at court during the reigns of his successors, Aistulf and Desiderius, and to have accompanied Adelperga, the daughter of Desiderius, whose education he had conducted, to the court of her husband, duke Arichis of Beneventum. For her he wrote, in 781, after he had become an ecclesiastic, one of his principal works, his *Historia Romana*, a work of no authority, as it is a mere compilation

from works which we possess, but which was greatly used during the whole of the middle ages, as the many manuscripts, recensions, and continuations of it attest. An edition of the genuine text is still awanting, but a great part of it is given in Muratori's *Rerum Italicarum Scriptores*, vol. i. (Milan, 1728). In 781 Paulus became a monk of Monte Casino; but afterwards went to France, and won the esteem of Charlemagne in a high degree by his character and learning. He aided that monarch in his schemes for the promotion of learning, and introduced the study of the Greek language into France. He made a collection of homilies from the best sources, at the emperor's desire, known as the *Homilarium*, often printed between 1482 and 1569, and translated into German and Spanish. At the request of Angilram, bishop of Metz, he also wrote a history of the bishops of Metz, *Gesta Episcoporum Mattensium* (printed in Pertz's *Monumenta Germaniæ Historica*, vol. ii.), the first work of the kind on the n. of the Alps, but the example of which was soon very generally followed. In 787, he returned to his convent, where he remained till his death, which is said to have taken place in 797. In the latter years of his life he wrote his history of the Longobards (*De Gestis Langobardum, Libri* 6), but did not live to complete it, bringing down the history only to the dath of Liutprand in 744. There are several editions or this work, the best of which is contained in the work of Muratori. It is characterized by remarkable candor, and a style unusually pure for that age. The high repute in which this work also was long held is attested by the great number of manuscripts and continuations. Paulus was likewise the author of a number of theological works, and of some hymns and letters still extant.

PAUL VERONESE. See CAGLIARI, PAOLO.

PAU'PER COLONIES are organized settlements of paupers, founded for the purpose of relieving the poor, morally as well as materially, by providing them labor, agricultural as far as possible, compelling them to work, and maintaining among them the utmost economy. Experiments in this direction were made in the last century at Flottbeck, near Hamburg, and at Liancourt in France. Only in the Netherlands has this method of dealing with the pauperism of a nation been seriously and extensively tried. In 1818, under the direction, chiefly, of gen. van den Bosch, an association of 20,000 members began planting P. C. in Antwerp in the s., and in Friesland, Overyssel, and Drenthe in the n. The results fell short of the expectations that had been formed; the membership declined, and the association had from time to time to draw subsidies from the state. At length, in 1859, such was the crisis in the association's finances, that the state took over into its own hands the colonies of Ommerschans and Veenhuizen, the society retaining under its own administration Fredericksoord and Willemsoord, Klein and Gross Watern, and Vledder. Then the association had the charge of 2608 colonists, 89 boarders, 115 orphans, and 207 officials—altogether, 3054, of whom 1552 were men. In 1866 the population of the beggar colonies was 5475, of whom 4685 were "beggars," 310 old soldiers, and 190 orphans, foundlings, and deserted children. Their live stock counted 835 head of cattle, 134 horses, 1278 sheep, and 113 pigs; and the land under cultivation measured 2108 acres. They made their own cloth, and produced yearly 400,000 coffee sacks and 600,000 meters of cloth. In 1875 the government colonies contained 2809 persons. These institutions are a great expense to the nation, but have reduced the numbers and improved the social condition of destitute people. The position of the colonists has of late improved, and their homes show signs of industry and comfort. When working in the factories, a tenth part of their earnings is placed in a reserve fund, to be paid to them in winter or in time of sickness. The Dutch institution has found imitation on a small scale in Belgium, France, Bavaria, etc.

PAUPERISM, the state of indigent persons supported or aided at the public charge, was recognized: 1, under the Mosaic economy, by special enactments authorizing the right of gleaning, setting apart portions of the produce of the land in sabbatical years, providing for re-entry in years of jubilee, enjoining loans without interest, forbidding perpetual bondage and regulating the manumission and redemption of bondsmen and bondswomen, allotting portions of the tithes, providing for the participation of the poor on festal occasions, and instituting the daily payment of wages; 2, among the Greeks, by public donations, such as the free distributions of corn, the so-called *cleruchiæ* among colonists (who, being mostly poor, were to be raised to a state befitting the dignity of Athenian citizens), the revenues from the mines, and the *theorica*, in the first instance designed to enable the poorer classes to attend theatrical exhibitions at the public cost, but afterwards considerably extended; 3, among the Romans, as one of the duties of government, the many frumentarian laws providing not only for the purchase and sale of corn to the people at a low price and at a price below cost, but also for its gratuitous distribution. The first legal provision of the second nature was made 123 B.C.; that of the third in the lex Clodia, 58 B.C., with the result that the free distribution of corn absorbed one-fifth of the entire revenue of the state. The great danger of the practice induced Cæsar to apply a remedy, in reducing the number of the recipients, by the rigorous exclusion of all persons unable to prove their Roman citizenship from the list of corn-receivers, from 320,000 to 150,000, and it was enacted that this number should not be exceeded. The *congiaria*, which in the early times of the republic were contribu-

tions of a *congius*, of oil or wine (= about 6 pints), designated afterwards liberal donations to the *people* (as contrasted with the *donativa*, or donatives to the *soldiers*) of oil, wine, corn, money, or other things, and always denoted that they were gratuitous. The limits fixed by Cæsar were soon exceeded, and the number of recipients had risen, 5 B.C., to 320,000. Augustus, 2 B.C., revived many of Cæsar's regulations, reducing the number to 200,000 entitled to receive corn on payment of a small sum, and providing for the gratuitous distribution to the absolutely indigent, who were furnished for the purpose with certain tokens, called *tesseræ nummariæ* or *frumentariæ*. These *tesseræ* became very valuable property in course of time, when the distribution of corn had become entirely gratuitous, and could be sold and bequeathed by will. At a still later period the public bounty, instead of supplying corn, furnished wheaten bread, baked at the public charge. Constantine extended the same privilege to Constantinople, with the amplification that the privilege, which at Rome was personal, became in the new capital attached to the *houses*. The daily allowance at Constantinople was, according to Socrates, eight myriads of corn, i.e., either of *modii* or of loaves. The history of Constantinople proves the disastrous consequences of the emperor's short-sighted policy, just as in the decline and fall of imperial Rome the policy of congiaria and donatives was a powerful factor of disintegration. When Odoacer reigned in Italy (476–90 A.D.), and the tributary harvests of Egypt and Africa were withdrawn, Pope Gelasius affirmed with strong exaggeration, that in Æmilia, Tuscany, and the adjacent provinces the human species was almost extinct. The plebeians of Rome were reduced to starvation, and actually perished when the cessation of the congiaria, a soil exhausted by famine, war and pestilence, the decay of agriculture, habits of idleness, and the interruption of commerce, left them in the most deplorable state of helplessness (see Gibbon, ch. 36). The care for the poor, at that period, passed from the hands of an impotent government into those of the church, and was dispensed on the principle of Christian charity. Through the instrumentality of the church the globe has been covered with countless institutions of mercy, of which the pagan world was utterly ignorant. But that subject belongs elsewhere, and is here only referred to for the purpose of indicating that the evil and spread of poverty have increased with the multiplication of charitable institutions. That aspect of the case, which is a stubborn fact, belongs to the venue of political economy, which has proved beyond all doubt that charity ceases to be charity when it supports and fosters idleness and destroys what has been felicitously called the parsimony of foresight. It is not the whole truth to say that charity is an unproductive expenditure: discriminating charity *is* productive expenditure, and to the latter belong certainly popular education, savings banks, insurance companies, law associations, and broad efforts for the suppression of vice. We have to deal with two forms of pauperism—one the result of improvidence, the other the result of providential visitations; and to the alleviation of both the attention of legislative bodies and philanthropists should be directed.—A brief survey of what has been done and is doing in that direction among the leading civilized nations is now in place. Beginning with Rome under papal rule, and the Latin-Catholic countries, excepting France, the affairs of the poor were generally administered, and with the qualifications above-named, well and exhaustively, though not without a tinge of bigotry, through ecclesiastical channels. The convents, monasteries, hospitals, and asylums were often liberally endowed and supported by public and private munificence. Many of the latter, even since the suppression of religious orders, are maintained, wholly or in part, at the public charge. Relief is often afforded by means of money, food, fuel, clothing, and tools. In Austria the "Institutes of the Poor," composed of the parochial minister, two persons called "fathers of the poor," and a controlling officer, all duly recognized by the state, are charged with the administration of hospitals, asylums, etc., and the dispensation of relief to the indigent. The system in cities is municipal, in country districts parochial in the English sense. In Switzerland, the communes must provide for their poor if disabled, and find work for those who are able. In Germany, a poor-tax is raised either by state assessment or self-assessment; communal and, in many instances, congregational boards afford relief; poor-houses, asylums, orphanages, and hospitals, mostly supported at the public charge, are abundant. In Russia, most of the comparatively few charitable institutions are supported by government. Hospitals outside the large cities are not frequent. In Norway and Sweden the public charities are administered by the church which is established; the system resembles that of Germany. The characteristic feature of the Danish system is the provision of monetary relief by loans. Holland compels all able-bodied paupers to support themselves by work in certain public institutions. The relief of destitute families in free pauper colonies flows from private sources. In Belgium, besides the vast array of charitable religious institutions taking cognizance of multifarious forms of distress, exist the public alms-houses in the different departments, in which able-bodied paupers are compelled to work for their support. In France, besides the religious charitable work done in hospitals, asylums, homes, etc., which began at a very early period (the Hôtel Dieu at Paris, formerly known as the Maison Dieu, was founded in the 7th c.), public relief dates back as far as the edict of John II. in 1350. The institution of boards of charity, begun at Lyons in 1531, enlarged at Paris in 1544, and extended in 1566 over France, with power to levy a poor-rate on all property, continued in operation until 1791. In successive reigns, in periods of general distress and destitution, paupers found employment in

industrial hospitals; public works were constructed to give employment to the poor; and the colonies were to be stocked with the surplus pauper population, which at times increased to a prodigious extent. The public almshouses (*dépôts de mendicité*), originated in 1793, were extended over all the departments in 1808, but speedily used for other purposes, revived in 1830, with the important modification that they should be for the reception of paupers required to work for their support. Inadequate to meet the evil, private benevolence, of strictly voluntary character, has created a large number of local bureaux of charity, which, however, as well as all philanthropic institutions, are under the supervision of government, which, in the administration of those of Paris, is represented by the prefect of the Seine as presiding officer of a council of clerics and laymen. Similar boards exist throughout the country. See Poor and Poor-Laws.

In the United States pauperism has from a very early period attracted the notice of the state legislatures and philanthropists, and originated a large number of charitable institutions, supported either at the public charge, or by private benevolence. In most of the states are state, county, or district almshouses or poor-houses, asylums for the insane and other forms of distress, orphanages and hospitals. The states generally assume the charge of the pauper insane, the counties and cities that of the strictly poor, and private charity that of the sick poor. The state legislatures make also very liberal grants to the different charitable institutions. The systems are by no means uniform, and differ in the various states, and the want of system is painfully apparent in the great paucity of statistics. Pauperism has grown with the growth of the country, and its increase after the rebellion was very marked; it prevails to a greater extent in winter than in summer, and thrives more in cities than in the country. It speaks well for the amelioration conditions of our republic that the vast immigration, which includes of course large numbers of paupers, adds a hardly perceptible percentage to our pauper population. The majority of those who leave Europe as paupers swell the ranks of the industrious and productive. The manifest tendency of pauperism to assume formidable dimensions in large cities suggests the expedient of devising a system for transferring the redundant unproductive labor collected in our large cities, to localities where it may at once become productive. There are not less than 100,000 unemployed persons in New York and Brooklyn, who might find profitable work in the interior of New York, Pennsylvania, and notably in certain portions of the south and west. Savings' banks for the benefit of those who have employment in summer and none in winter are also a step in the right direction. According to the U. S. census of 1880, the pauper element is set down as 88,665 in a population of 50,155,783; this is a palpable understatement of that number. New York and Pennsylvania are credited with 28,000. The cost of maintenance of paupers in the U. S. is estimated at not less than $10,000,000, half of which is allotted to New York, Pennsylvania, and Massachusetts. This is a fair sample of the bewildering confusion in all statistics bearing on this important subject, and impairs their value for comparison. According to Hausner, the smallest pauper population in Europe is in Prussia and Austria, then comes France, then Great Britain, Switzerland; and the small states of Holland and Belgium have the largest. Holland has 1 pauper to every 7 inhabitants; France 1 in 29½ (a Swiss authority says 1 in 9); Great Britain 1 in 22; Germany and Austria together, 1 in 30. It is mere guess-work to give the proportion in the United States, but it is safe to say that it exceeds 1 in 100. The practice of administering relief varies in the different countries. In-door relief in France is restricted to the insane, the sick and decrepit, and to abandoned children. Illegitimate children are given to their mothers, who receive out-door relief; the greater number of other children are boarded out at the public charge. Out-door relief is practiced on a large scale with very satisfactory economical results. In Prussia, likewise, out-door relief is the favorite mode. The system adopted at Elberfeld (and imitated elsewhere) combines features worthy of all acceptation. Judicious persons, representing both public and private charity, seek for the deserving poor by systematic house-to-house visitation and dispense to them the relief flowing from both sources. Similar work is done in some of our large cities, and the urgency of measures blending public charity and private benevolence is very widely felt. An effort to combine the independent charitable organizations in New York city was begun, in 1882, and with such success that in the year 1891 the following agencies were in co-operation: 55 general societies for out-door relief, 9 national societies for out-door relief, 36 medical charities, 19 asylums and institutions for in-door relief, 203 churches and congregations. The city is divided into districts, each having a governing committee, paid agent, and body of friendly visitors. An alphabetical street register is kept, showing how many families have received charitable relief during each year or have had members in the penitentiary. See Mendicancy; Beggars.

PAUSA'NIAS, a famous Spartan regent and general, the son of Cleombrotus, and nephew of Leonidas. He commanded the confederate Greeks in the important battle of Platæa (479 B.C.), in which the Persians were totally routed, and their leader, Mardonius, slain. He then marched his troops against Thebes, and compelled the inhabitants to give up the chiefs of the Persian party to him for punishment. Elated by this victory, however, he became in an extreme degree haughty and vain-glorious, took all the credit to himself, and allowed none to the Athenian generals, Aristides and Kimon, who commanded under him, and treated all the other Greeks as if the Spartans were their lords.

Nevertheless, he still continued his conquests, capturing Cyprus and Byzantium. It was here he first began to play false to Greece. He entered into secret negotiations with Xerxes, with the view of becoming ruler, under the Persian monarch, of the whole country, and in his journey through Thrace, even adopted the dress and luxurious habits of a Persian satrap, and surrounded himself with a body-guard of Persians and Egyptians. Being recalled, on account of these things, by the Spartans, his former services procured his acquittal. He then returned to Byzantium, where he renewed his traitorous intrigues, was expelled from the city for a criminal assault upon a Byzantine lady, withdrew to the Troad, and there continued his treachery. He was a second time called to account by the Spartan ephors, but again escaped, though with greater difficulty. Yet his passion for the sovereignty of Greece, even though at the expense of the national liberties, once more drove him to play the traitor. He tried to stir up the Helots, but was taken in his own net. A Helot betrayed him. When Pausanias found his position desperate, he took refuge in a temple of Athene. Hereupon the people blocked up the gate of the temple with heaps of stones, and left him to die of hunger, his own mother depositing the first stone.

PAUSANIAS, one of the most eminent of Greek geographers and historians, was probably a native of Lydia in Asia Minor, and was born some time in the 2d century. He traveled through almost all Greece, Macedonia, and Italy, and also through part of Asia and Africa, and composed from his observations and researches an Itinerary, entitled *Hellados Periēgēsis*, in ten books, describing the diferent parts of Greece, and giving a particular account of the monuments of art and of the legends connected with them. His style is by no means pure; but in matters of his own observation he is most trustworthy, and his work is, on many subjects, one of the most valuable sources of information that we possess. There are numerous editions of his work: the oldest was printed at Venice in 1516 by Aldus; and the most recent is that by J. H. C. Schubart and C. Walz (3 vols. Leip. 1838–40). Translations of Pausanias exist in English, German, and French.

PAUW, Cornelis de, 1739–99; b. Amsterdam; educated at Göttingen. He is known as the uncle of the revolutionist Anacharsis Clootz. He became canon of Xanten in the duchy of Cleves; was afterwards appointed reader to Frederick II. of Prussia. He declined the place of an academician of Berlin and a bishopric at Breslau. He published works on the history and physiology of several nations and countries, among which were *Recherches sur les Américains*, designed to show the native inferiority of the savages of America; *Recherches sur les Egyptiens et les Chinois*, 2 vols.; *Recherches sur les Grecs*, 2 vols. These were translated into English. They contain curious information, but many unproved assertions made in a dogmatic spirit. His attacks on the Jesuits rendered him unpopular with the Roman Catholic clergy, though they respected his talents and learning.

PAUWELS, Ferdinand, b. Belgium, 1830; studied painting at Antwerp and under Woppers, and lived in Rome, 1852–57. His first picture, exhibited in 1851, was the "Meeting of Baldwin I. with his daughter Joan at Constantinople in 1206." His "Coriolanus" attracted much attention the next year, and gave him the means of living in Rome, where he still further improved himself, taking his subjects from the Old Testament and the hagiologies. From 1862 to 1872 he was professor at Weimar. He now lives in Antwerp. Among his pictures may be mentioned "Banished by Alva," 1861; "Reception by Louis XIV. of a Deputation from the Doge of Genoa," 1864; "Queen Philippa of England Relieving the Poor of Ghent," 1866; "Hans Pleinhorn, a Merchant of Nuremberg, surprised with his Family while engaged in Protestant worship," 1868.

PAVEMENT, flat stones or "flags" used for the flooring of halls, kitchens, and other apartments, and frequently for footpaths; also the stone covering of the roadway of streets. The stones used for flags vary in different districts, according to the geological formation of the neighborhood. The pavements now most commonly used in England and Scotland are the Arbroath and Caithness stones—the former a softer and more agreeable stone than the latter, which is exceedingly hard and slippery when wet. Pavement should be carefully laid on a solid dry foundation, and set in a good bed of concrete or lime, and the joints pointed with cement. It may also be laid on small dwarf walls, built of brick, so as to support all the edges—this is a good method for keeping the floor dry.

The Paving of Streets is of early date, and is, in fact, necessary to any considerable degree of civilization and traffic. The Romans paved their streets in the same elaborate and solid manner in which they paved their highways. See Roads. Portions of the ancient pavement of the streets of Rome are in use to the present day, and the pavement of Pompeii remains entire. It is laid with large blocks of stone of polygonal shape (like Cyclopean masonry), very carefully fitted together, and of considerable depth, and below there is a carefully prepared basis, often composed of several distinct strata. Some of the Italian towns—Florence, for instance—have still pavement of this description, and no foot pavement.

The mediæval cities were almost all unpaved till about the 12th c., when the main streets of the chief towns began to be protected with stone. The plan now adopted is nearly the same in all the cities of Europe. The first thing to be done is to secure or

make a solid foundation. This is done, where the natural substratum is not of a solid kind, by laying the street with a solid bed of concrete, having a slope from the middle to the sides to throw off the water. On the concrete is placed the real pavement, which is composed of blocks of granite, trap, or other tough rock. These should be rectangular, and the deeper the better. They are generally about 10 in. to 12 in. in depth, and 6 in. or 7 in. broad, and from 1 to 2 ft. in length. They should be all bedded and jointed in strong mortar. This is not often done, as it is thought sufficient to bed the stones in sand, and grout them with hot lime on the top. It is clear, however, that the more equal the stones are *in depth*, and the more solidly they are bedded, the longer they will last. Other materials besides stone have been tried for the paving of streets—such as blocks of wood with the end up, and blocks of cast-iron. The wooden pavement is delightfully easy, and not noisy, but in wet weather it is exceedingly slippery. Cast-iron is too hard, and causes too much jolting and noise.

The great obstacle in the way of really good pavement in modern streets is the necessity of frequently breaking it up for the laying and repairing of pipes for gas, water, etc. The true remedy—and, in the end, the cheapest—would be to have, in the chief streets at least, sub-ways or tunnels for drains and pipes, accessible without breaking up the pavement.

Although the term pavement is in its proper use strictly applicable only to a single kind of covering for a roadway, it is better here to regard it as including all the various materials used in constructing durable roads, and especially the streets of cities. The oldest, the best, and the most durable of all roads, the Roman, was built under wholly different conditions from any modern road. The raised center-part on which was the pavement was first excavated and rammed, then a double layer of flags was set, on this a kind of rough concrete some 18 in. thick, and on this the large thick paving-stones, random-jointed, but cut and butted to match with perfect accuracy, the whole in mortar and cement. This is a flat wall, not a roadway, and, costing more than any modern race would put into such an improvement, remained just as good as at first when, as at Pompeii, the chariot-wheels had worn ruts 4 in. deep in the stones.

Modern road-making dates only from the French superintendent of 1775, Tresaguet. He made a foundation of large flat flags, double thick, if desired; on this laid broken stone; and over all sand and fine stones. The system was good, but the administration of the time was without means of timely repair. Macadam's system, of about 1820, rests on two points; a dry road is a good road, therefore the compact earth itself will serve as a foundation, and there is no need of heavy flags beneath the surface proper; again, large stones never amalgamate, and dirt, sand, and soft stones, only turn to dust or mud. On a rammed and rounded surface, dry and in good condition, are successively spread two layers of medium cracked stone, and on these one or two more of fine cracked stone. All materials must be clean, and all stone must be hard. As soon as the materials are amalgamated by traffic, the road must be carefully surfaced and continually repaired. His whole thickness was of about 9½ in., and the crown of 1 in. to the yard. Telford made certain changes in construction, and Polonceau invented the heavy roller, to avoid the wear and tear of vehicles in consolidating the surface. At present the "metaled" road is laid on a foundation of clear screened gravel, on rammed cobble-stones or on a compacted clay; two layers of stone will be sufficient, and these are amalgamated by the roller. It is a mistake to suppose that the surface needs repicking and re-rolling at intervals; the surface is lightly picked when new materials are added, but all further disturbance should be avoided. Paved roads are usually made by ramming to a crowned surface, throwing on this ½ to ¾ in. screened sand, laying the pavings on this, and ramming to an even surface with a pavior's rammer. All old work, both in this and other countries, was done with cobble-stones; and although some modern work has been made of small flags with cuts upon them, the best and only satisfactory pavement is a block. These are either square or oblong, and should be about 1⅞ to 2, as deep as wide, and not tapered, as they must be turned and relaid when worn smooth. Joints should always break, nor should they ever be allowed to get in line with the street, since wheels immediately start a rut at the point. At the crossing of two streets, we usually set the blocks in circles, but abroad they are set at right angles to the X joining the corners. The best material for our common square-block pavement is the blue gneiss or the trap, but for long blocks, exposed to more fracture, any of the granites. For bridge-stones at crossings, greywack, quartzoze gneiss, the oölite limestones, or the compact granites. No gutter stones are needed, nor is there, as once supposed, an enormous pressure outwards, as of the thrust of an arch. The rounded surface, or crown, has been much reduced; originally $\frac{1}{40}$, $\frac{1}{70}$ is now enough. Metaled roads should be kept rather flat in the center, with a quicker slope at the sides; paved roads, the opposite. Friction is greater on paved roads, but traction is easier; in other words, carriages take the macadam; wagons, the pavement. The life of a pavement depends on the stone, and on the traffic, but in a city street of average use it may be called about 14 years. Some of the London pavements laid in mortar exceed this, and the Paris pavements, constantly repaired, do better yet. A road must be capable of drainage, since no road-bed is waterproof, the surface water being thrown off; but, infiltration taking place continually if on a sand, no impervious bed must be interposed, and if on

a clay, and it be found impossible to sand-fill below frost level, a crowned surface and a layer of cobble-stones must act as sub-soil drains. The surface of the road must not be broken up. In the newer streets of Paris, sewers and pipes are beneath the sidewalks, but in the older, as elsewhere, the streets are continually torn up by the workmen. With us the system is lax. To relay a long line of pavement over an excavation by throwing in dirt, and setting the pavement to one long joint, is to violate every known principle of road-building. Over a pipe the earth should be settled by water, then more put on and rammed; finally, for heavy traffic, 2 in. concrete at least under the stones. In laying block pavements everything depends upon careful hand-work. If a block drives too much or too little, it should be replaced, the joints should be carefully hand-filled with fine screened sand, and, a light covering of sand sprinkled over when finished, should be thoroughly flushed down before opening for traffic. No inch layer of sand need be left; it only chokes the sewers. Above all, every defect must be immediately remedied by competent workmen, with portable tool-boxes and equipments, under a responsible superintendent.

A bitumen covering to a sidewalk and, for easy traction and lessening of noise, to a road-bed, was the subject of experiment at Paris from before 1840 to 1854, when the first real success was effected. Many experiments with bitumen and wood were made in America from 1862 to 1874. A wood pavement must expose the cross-grain of the wood; it should be kyanized or otherwise treated against rot, and it should be graveled so that the sand, imbedding itself in the wood, offers a harder and, in wet weather, a rougher surface. The mixture of sand and bitumen does not set, and sand, lime, and bitumen show the effect of hot weather. The addition of asphalt, a calcareous earth soaked with bitumen, almost supplies the needed element, but the success of the process has never been attained without compression. Our wood pavements, and all the asphalt or bitumen surfaces laid on them or on sand, have failed. They soaked, rotted, burst, or sunk, because of inattention to the foundation. An asphalt pavement must be prepared as in France, by a concrete foundation, or by a mixed foundation ending in rolled gravel, as for a Telford metaled road; or it may be laid on a well-rammed, well-repaired block pavement. The asphalt, whatever mixture may be selected, is applied hot and rolled slightly and gradually, then heavily. It need be only thick enough to make a surface; it is easily cut out and easily repaired; and in fact, a street made piece by piece, is, if rightly done, after some traffic, homogeneous. The asphalt must, however, be perfectly free from damp, and in wet weather repairs can only be made by heat and under cover. The real objection is its slipperiness in wet weather, and the disagreeable and muddy condition it always shows in wet weather, unless continually swept and watered.

PAVIA, a province of Italy in the *compartimento* of Lombardy, having the Milanese on the n., Piacenza on the e., Alessandria on the s.w., Novara on the n.w., and Genoa on the s.; 1239 sq. m.; pop. 237,527. The length from n.w. to s.e. is about 40 m., the breadth at the narrowest portion, 10 miles. It is drained by the Po, the Ticino, and other small streams. It is intersected by a network of canals, among which are the Naviglio-di-Bereguardo, and the Naviglio-di-Pavia, supplying communication by water between Milan and the Lago Maggiore, the Ticino and Po, and by the Po with the Adriatic sea or gulf of Venice. Its surface is generally level, consisting exclusively of the broad plain of the Po. Its soil is remarkably fertile, and the vine, olive, and fruit trees yield abundant crops, and a specialty of the region is mushrooms. Hemp is raised, the pasturage is excellent, and much attention is paid to the raising of cattle. Silk and cheese are the principal manufactures. It is divided into the four districts of Bobbio, Mortara, Pavia, and Voghera. Capital, Pavia.

PAVI'A, a city of northern Italy, capital of the province of the same name, on the left bank of the Ticino, 20 m. s. of Milan, and 2 m. above the confluence of the Ticino and the Po and on the Milan and Genoa railway. A covered bridge of seven arches and an iron railway bridge connect the city with the *Sobborgo Ticino*, on the right bank of the river, and right through the town from n. to s. runs the *Corso Vittorio Emmanuele*. The city is large, surrounded by walls, and has an imposing appearance, bearing the impress of antiquity. In former times it was called the "city of a hundred towers;" but the palace of Theodoric, and the tower where Boëthius wrote the treatise *De Consolatione Philosophiæ*, no longer exist; among the remaining ones are those of Belcredi and Del Maino, which are each 169 ft. high. Its oldest church, and perhaps the oldest in Italy, is that of San Michele, which is first mentioned in 661 and was restored, 1863–76. The cathedral, containing some good paintings, was commenced in 1488, but was never finished. In a beautiful chapel attached to it are the ashes of St. Augustine, in a sarcophagus ornamented with 50 bassi-rilievi, 95 statues, and numerous grotesques. In the church of San Pietro in Ciel d'Auro are deposited the remains of the unfortunate Boëthius. The Certosa of Pavia, now secularized, the most splendid monastery in the world, lies five miles north of the city. It was founded in 1396, contains many beautiful paintings, and abounds in the richest ornamentation. It has an octagonal cupola, painted ultramarine, and enameled in gold. It was sacked by the French in 1796. Its church is in the form of a Latin cross, and is 249 ft. long, and 173 ft. wide. The university of Pavia is said to have been founded by Charlemagne in 774, and was one of the most famous seats of learning during the middle ages. Its efficiency was much in-

creased by Galeazzo Visconti, who bestowed many privileges upon it in the year 1396. It consists of numerous colleges, and attached to it are a library of 135,000 vols., a numismatic collection, anatomical, natural history, and other museums, a botanic garden, a school of the fine arts, etc. The university is attended by 1529 students and auditors. It has numbered among its professors Alciati, Fidelfo, Spallanzani, Volta, Scarpa, Foscolo, and Monti. The other chief edifices comprise private palaces, theater, gymnasium, etc. Pavia carries on a good trade in wine, rice, silk, and cheese, and manufactures machines, hats, organs, chemicals, etc. Pop. '94, 37,400.

Pavia, the ancient *Ticinum* (afterwards *Papia*, whence the modern name), was founded by the Ligurii; it was sacked by Brennus and by Hannibal, burned by the Huns, conquered by the Romans, and became a place of considerable importance at the end of the Roman empire. Then it came into the possession of the Goths and Lombards, and the kings of the latter made it the capital of the kingdom of Italy. It became independent in the 12th c., then, weakened by civil wars, it was conquered by the Visconti in 1359. Since that period, its history is merged in that of the conquerors of Lombardy. Here, in 1525, the French were defeated by the imperialists, and their king taken prisoner; but in 1527, and again in the following year, it was taken and laid waste by the French. It was stormed and pillaged by Napoleon in 1796, and came into the possession of Austria by the peace of 1814. Since 1859 it has been included within the kingdom of Italy.

PAVIA. See Horse-Chestnut.

PAVIE, Théodore Marie, 1811; b. at Angers; traveled at an early age in the United States, Central America, and Asia, where he mastered the Chinese language, Sanskrit, and other Asiatic languages; became a contributor to the *Revue des Deux Mondes* and the *Bulletin de la Société de Geographie*, and was professor of Sanskrit literature in the college of France, 1852–57. His most important work is the *San-koué-tchi*, a history of China in the 13th c., published, Paris, 1851, 2 vols. His works descriptive of his travels are numerous. His latest works are *Recits de Terre et de Mer*, 1860, and *Recits des Landes et des Grèves*, 1863.

PAVIL'ION, a portion of a building, under one roof, of a tent-like form, with the slope of the roof either straight or curved. This form is much used in France—the higher parts of the new buildings at the Louvre are good examples of pavilions. Pavilion roofs are sometimes called French roofs.

PAVLOGRAD', a t. of south Russia, in the government of Ekaterinoslav, and 57 m. e.n.e. of the town of that name, on the Voltcha, an affluent of the Dnieper. It was founded in 1780, during the reign of the empress Catharine II., and its first colonists were the Zaporogsky Cossacks. But in 1782 a great portion of the English garrison of fort Magon in Minorca, having been subdued by the Spaniards, and being forced by the terms of their capitulation to renounce the English service, obtained liberty from the empress Catharine to settle in Pavlograd. The garrison was composed chiefly of Corsicans. Pop. of the town, '92, 16,264.

PAVON'IDÆ, a name sometimes used to designate the family of gallinaceous birds more commonly called *phasianidæ* (q.v.), sometimes applied as a designation to a portion of that family separated from the rest on very slight grounds, the chief distinction being the greater expansion of the tail. See Peacock.

PAWCATUCK' RIVER is formed by the union of Charles and Wood rivers in Washington co., R. I., flows w. and then s.w., forming the boundary line between Westerly, R. I., and Stonington, Conn. It empties into Little Narragansett bay, and is navigable for several miles.

PAWHE'A, a t. in Guinea, Africa, consisting of a mere collection of huts, on the road from Dahomey to the coast; pop. 16,000.

PAWL, on shipboard, is a catch or hook to prevent the capstan from flying round backwards during a pause in the heaving. A similar catch is used in the common windlass.

PAWN'BROKING (Du. *pand*, Ger. *pfand*, Fr. *pan*, a pledge). The business of lending money on pawns or pledges appears to have been carried on in England by certain Italian merchants or bankers as early at least as the reign of Richard I. By the 12th of Edward I., a messuage was confirmed to these traders where Lombard-street now exists; the name being, according to Stow, derived from the Longobards who used to congregate there for business purposes. Subsequently, these merchant adventurers became known generally by the name of Lombardens. Their wealth became proverbial. Among the richest of them were the celebrated family of the Medici; from whose armorial bearings it is conjectured that the pawnbroking insignia of the three balls have been derived. The bankers of Lombard-street appear to have exercised a monopoly in pawnbroking until the reign of Elizabeth. The trade is first recognized in law by the act 1st James I. c. 21. In the perilous days of Charles I. the goldsmiths were very frequently chosen as the custodiers of plate and money; which circumstance seems to have suggested to them the profitable business of lending on pawns and discounting bills. From this time, the oppression and extortion often exercised by brokers has continued to attract much public attention and discussion; and an effort has been made, both in England and on the con-

tinent, to obviate the evil by the establishment of what are called Monts de Piété, the object of which is to advance small sums to the very poor at a moderate interest. See MONT DE PIÉTÉ. In England, after many abortive efforts, a Mont de Piété office was started in 1708; but in 1731 it came to a disastrous end. The bubble mania of 1824–25 gave rise to a similar scheme. In this instance upwards of £400,000 was subscribed; but the undertaking miscarried and the capital was lost. A similar fate attended the Irish Monts de Piété, of which there were eight in 1841. In 1848 they had all disappeared except one, which lingered to 1853; when it also expired. It would thus seem hopeless to attempt to establish a pawnbroking office in England on any other footing than an ordinary commercial one. The cause of failure will be found to lie, generally, in the great difficulty of conducting a commercial undertaking on charitable principles, with sufficient energy and ability to compete successfully with others originating in the ordinary motives which lead men to engage in trade.

It hardly admits of dispute that the pawn-shop, in its practical working, is an evil—necessary, it may be, but still an evil; and the having recourse to it is strongly to be discouraged. There are, doubtless, cases where men are driven to pawn their goods from causes which are not discreditable, and which do not render it certain that they are on the road to ruin; but such cases are rare exceptions to the general rule. Besides making borrowing too easy, and thus encouraging the fatal habit of anticipating income, the pawn-shop is, in nine cases out of ten, the door to the drinking-shop. Even where the one does not directly lead to the other, it generally does so in the end. That "borrowing dulls the edge of husbandry" applies with a force increasing in a geometrical ratio as we descend in the scale of society. Admitting, however, that with all its tendency to demoralize, pawnbroking is, in many cases, of value in tiding over unforeseen pecuniary difficulties, it is sufficient to say, that so long as improvidence prevails among large classes of society, and so long as even the most prudent are liable to unforseen accidents, the accommodation of the pawn-shop is to a certain extent a necessity, and like other demands of the public will continue to be supplied. Nor are those who supply this demand to blame, any more than the caterers for many other expenses which economists pronounce to be wasteful. The fault, where there is a fault, is in those who borrow, not in those who lend. The legislature, accordingly, instead of trying to put down pawnbroking, has wisely confined itself to putting it under stringent regulations so as to prevent as far as possible its abuses.

Pawnbrokers are restricted in their business as regards loans under £10, by the statute 35 and 36 Vict., c. 93, which repealed all the prior statutes, and defined new offenses, and it also extends to "leaving-shops." The statute requires them to take out a license (for which they pay £7 10*s*.), and keep exhibited outside their names and business, fixes the rate of interest, and makes it necessary that a table of interest should be put up in a conspicuous part of the shop, to keep books with correct entries of the name and place of abode of the owners of goods, etc. If the owner of goods has just cause to suspect that such goods have been pawned at a particular shop, the justices of the peace may grant a search warrant, and if found, the goods may be restored to the owners. Pawnbrokers are expressly prohibited from taking in pledge linen, apparel, or unfinished goods, intrusted to any person to wash, manufacture, make up, etc., and also any goods under circumstances which should have aroused their suspicions. Goods which have been in pledge for a year may be sold, and the pawnbroker may bid for them if done openly. If the duplicate is lost, the owner of the goods may obtain a fresh one on verifying the fact of his being the owner before a justice of the peace. If the money borrowed be tendered with interest within the year, the pawnbroker is bound to deliver them up, otherwise a justice of the peace may by order compel him to do so. The mode of selling forfeited goods is prescribed by the statute, for all pledges above 10*s*. to be by auction—the catalogues to contain the names of the pawnbrokers, and the month when the goods were pawned, and the number entered in the pawnbroker's books. The result of the sales is to be entered in the books of the pawnbroker and auctioneer, and the surplus is to be paid on request to the owner of the goods if claimed within three years. In the case of pledges below 10*s*., the pawnbroker becomes the absolute owner after 12 months. Pawnbrokers are not to take goods in pawn from persons under the influence of drink, or under the age of 12. In case of penalties imposed on pawnbrokers for offenses against the act, the complainant, if the party aggrieved, and then only, generally gets half. In case of fire the pawnbroker is liable to the owner for the value of the goods (after deducting the amount of loan and profit), and 25 per cent. on the amount of the loan; but this only if the claim be made within 12 months after the pawning.

The greatest pawnbroking establishment in the world is the Mont de Piété of Paris. It trades with borrowed capital, and with the profits of former years temporarily capitalized. Recent statistics are not at hand; but it has been reported to receive in one year 1,431,575 pledges, valued at $5,180,000, including renewals, and the average charge was about 15 per cent. per annum. Taking one of the largest offices in England out of London, we find that in one year it received 142,835 pledges, valued at £36,560, including renewals, and the average charge was 25 per cent. per annum. Various circumstances render the difference between the rates really much less than these figures indicate; still there is no doubt that the interest charged on small loans is lower at the Mont de Piété of Paris than in the pawnbroking offices in this country; but this con-

venience is limited by the fact of the French establishment taking no loans under 3 francs.

The statutes of the United States generally regulate this business very carefully. The usury laws do not apply to loans by pawnbrokers, and they charge a high rate of interest, fixed by statute. The laws on this point are, as a rule, modeled after the English statute, but vary from it in unimportant details. In N. Y., for example, the statute provides that no person shall act as a pawnbroker without a license as such; and such licenses can be granted only in cities whose charters of incorporation give them specially the right to issue such licenses. Pawnbrokers must return goods to the rightful owner, but can oblige him to give a bond to answer in damages, should the title prove to be in some other person.

PAWNEE', a co. in central Kansas, intersected in the s.e. by the Arkansas river, followed in its course by the Atchison, Topeka and Santa Fé railroad; 756 sq.m.; pop. '90, 5204, chiefly of American birth, with colored. It is drained by the Arkansas river and its affluent, Pawnee creek, on which is Fort Larned, a military post, 7 m. from Larned railroad station. Co. seat Larned.

PAWNEE', a co. in s.e. Nebraska, having the state line of Kansas for its s. boundary; 432 sq. m.; pop. in '90, 10,340, chiefly of American birth. It is intersected by the Chicago, Rock Island, and Pacific, and the Burlington Route railroads. It is drained by the Big Nemaha river, the South fork, and Turkey creek, affluents of the Missouri river. Its surface is hilly in some localities, containing extensive beds of bituminous coal, with a large proportion prairie and some woodland. Its soil is calcareous, and by the rivers a rich sandy loam, adapted to the production of all kinds of grain and stock-raising. Co. seat, Pawnee city.

PAWNEES', a tribe of Indians in Nebraska, about the Platte river and its affluents, and comprising the four tribes of Loups, Republican Pawnees, Grand Pawnees, and Tapage Pawnees. They are on Marquette's map in 1673. In the 18th c. numbers of them were slaves in Canada, where Pani became a synonym for any slave Indian. Then as now, they were always at war with the Sioux. They lived in lodges roofed with earth, raised small crops of maize and vegetables, and were in the habit of sacrificing prisoners to the sun as a means of securing large crops. Besides the Sioux, they fought the Sacs and Foxes, the Kiowas, and the Arapahoes. In 1832 the Delawares, who had settled in their vicinity, destroyed the village of the Great Pawnees on Republican fork. In 1833 the tribe ceded their lands s. of the Nebraska river. They remained on that portion of their territory n. of the Nebraska, and were prosperous for a time, devoting themselves to agriculture; and schools were established among them. An irruption of the Sioux broke up their settlements, and drove them s. of the Nebraska. This was contrary to their stipulations in the treaty of 1833, and in consequence they ceased to receive the annuity which that treaty secured to them from the United States. Their numbers, which had some years before been greatly reduced by small-pox, were now still further lessened by the cholera; and the Sioux continued to attack their settlements in spite of an additional treaty between the United States and the Pawnees in 1857. They furnished a contingent to the United States in the war with the Sioux in 1861. They are now under the management of the society of Friends, and are granted an annuity by the government, which maintains schools among them.

PAWTUCK'ET, a city in Providence co., R. I.; on both sides of the Pawtucket river and on the New York, New Haven, and Hartford, and the New York and New England railroads; 4 miles n. of Providence. It was settled in 1665; was selected by Samuel Slater as the site of the first cotton factory in the United States in 1790; and was chartered as a city in 1886. It has an area of over 8 sq. miles, national and savings banks, electric lights and street railroads, excellent waterworks, over 20 churches, numerous public and parochial schools, public library, public park, and extensive thread mills, print works, machine shops and foundries, and cotton, woolen, and hair cloth mills. Its manufactories use a capital of over $16,000,000, and have products valued at about the same amount. Pop. '90, 27,633.

PAX, called also PACIFICALE and OSCULATORIUM (Lat. *osculor*, I kiss), the "kiss of peace," and also a sacred utensil, employed in some of the solemn services of the Catholic church in the ceremony of giving the so-called "kiss of peace" during the mass. The practice of saluting each other—the men, men, and the women, women—during public worship, and particularly in the *agape*, or love-feast, is frequently alluded to by ancient writers, as Cyril of Jerusalem, Catech. xv., and St. Augustine, Serm. 227. All the ancient liturgies, without exception, refer to it as among the rites with which the eucharist was celebrated; but they differ as to the time and the place in the eucharistic service in which it is introduced. In the eastern liturgies it is before, in the western after the offertory (q.v.); and in the Roman it immediately precedes the communion. The ceremony commences with the celebrating bishop or priest, who salutes upon the cheek the deacon; and by him the salute is tendered to the other members, and to the first dignitary of the assistant clergy. Originally, the laity also were included, but this has long since been abandoned. It is when the mass is celebrated by a high dignitary that the utensil called the pax is used. The pax is sometimes a crucifix, sometimes a reliquary, sometimes a tablet with a figure sculptured or enameled upon it. Having

been kissed by the celebrant, and by him handed to the deacon, it is carried by the latter to the rest of the clergy. In ordinary cases the pax is given by merely bowing, and approaching the cheek to the person to whom it is communicated. The pax is omitted in the mass of Maundy-Thursday (q.v.), to express horror of the treacherous kiss of Judas.

PAXOS, the smallest of the Ionian islands, lies 10 m. s.w. of the coast of Albania, and 9 m. s.s.e. of the island of Corfu. It is about 5 m. long, and about 2 m. broad. The capital, or rather the chief village, is Port Gayo, on the e. coast. Produces fruits and olive oil, also goats and mules. The island is mountainous, and there is no drinkable water. Pop. with Antipaxos, 5,000.

PAXTON, JOHN R., D.D., b. Canonsburg, Penn., 1843; was educated at Jefferson coll., Penn., and at Princeton and Alleghany theol. seminaries. At the outbreak of the civil war he enlisted as a private in a Penn. regiment, and was mustered out as second lieut., 1865. He was pastor of the Pres. church, Churchville, Md., 1870–74; of the Pine st. church, Harrisburg, Penn., 1874–78; of the New York ave. church, Washington, D. C., 1878–82, whence he was called to the West Pres. church, New York, where he served till his resignation, 1893.

PAXTON, Sir JOSEPH, English architect and horticulturist, was b. at Milton-Bryant, near Woburn, Bedfordshire, in 1803. He was sent to Woburn free school, but left it at an early age, and obtained employment as a working gardener. He entered the service of the sixth duke of Devonshire, at Chiswick, and was thence transferred to Chatsworth, where he became the duke's chief gardener. His abilities as a horticulturist found ample scope in the beautiful gardens of Chatsworth, and are further attested by *Paxton's Magazine of Botany*, of which he was editor, as well as other works on plants and flowers. The experience he obtained in designing capacious glass conservatories at Chatsworth led him to propose a crystal palace of glass and iron for the great exhibition (q.v.) of 1851. It was the first time these materials had been employed on so extensive a scale, and visitors found an inexhaustible theme of admiration in a fairy palace so novel, beautiful, and magnificent. His design obtained for him great popularity and the honor of knighthood. The crystal palace of 1851 was removed from Hyde park, but became the germ of the nobler and more splendid palace at Sydenham, the construction of which he superintended; the grounds were also laid out by him. Crystal palaces for exhibitions of artistic and industrial objects have since 1851 been constructed at Dublin, New York, Paris, Manchester, etc. In 1854, Paxton was returned to parliament on the liberal interest for Coventry, which he represented for about 10 years. He was a member of many learned societies in Europe, and his works on horticulture and botany are much esteemed. He died in 1865.

PAY-MASTER (in GREAT BRITAIN).—Military pay-masters are either "control" or "regimental." Of the latter, who constitute by far the more numerous class, there is one to every brigade of artillery, regiment of cavalry, and battalion of infantry. The pay-master holds no other commission, but the appointment is nearly always conferred upon some person who has previously held a combatant rank in the army. The functions of pay-master comprise issuing and accounting for the pay of officers and men, and having charge generally of all the finances of the corps. In discipline, the pay-master is responsible to the officer commanding the regiment; but in all money matters he looks for orders to the war office alone. He commences with a pay of 12s. 6d. a day, with the relative rank of captain; and after 20 years' service attains the pay of £1, 2s. 6d. a day and relative rank as major. Regimental pay-masters were first appointed during the French war.

Control pay-masters have financial charge in the military districts or sub-districts. They form a separate department under the surveyor-general of the ordinance, comprising pay-masters, deputy pay-masters, and assistant pay-masters.

The NAVAL PAY-MASTER is for a ship what the military pay-master is for a regiment; but he adds to these duties some of those performed in the army by the quartermaster, commissariat, and military store-keeper, for he has charge of the provisions, clothing, and miscellaneous stores, as well as of mere money. Pay-masters are commissioned officers, receiving from 14s. to £1, 13s. a day, and ranking, according to service, with lieutenants, commanders, and captains. Up to the year 1844, pay-masters were styled pursers, and were paid by profits they made on certain of the ship's charges. At a still earlier period these pursers had been warrant-officers.

PAY-MASTER (in the UNITED STATES).—It is the duty of pay-masters in the United States army to pay all the regular and other troops in the service of the United States, making correct reports to the paymaster-general once in two months. When volunteers or militia are called into service, the president may assign to any officer of the army the duty of pay-master. Pay-masters are required to give bonds. In the navy the pay corps is the outgrowth of the old system of pursers, who were formerly civilians appointed for the cruise of a vessel only, whose duties were to supply all articles needed for the cruise and to pay all officers and men on board, and all bills incurred. The system was reorganized by congress, and the corps of pay-masters established, which now comprises 13 pay-directors, ranking with captains; 13 pay-inspectors, ranking with commanders; 50 pay-masters, ranking with lieutenant-commanders or lieutenants; 30 passed assistant pay-masters, ranking with lieutenants or masters; and 20 assistant pay-masters,

ranking with masters or ensigns. Pay-masters purchase all supplies, pay the officers and men, and have charge of all ship-stores, when at sea; and when on shore-duty are employed in the naval purchasing agencies, or have charge of provisions, clothing, and small stores in navy-yards. The senior pay-master of a fleet makes all purchases and distributes all funds to the pay-masters of the vessels of the fleet, being himself generally attached to the flag-ship.

PAYMASTER-GENERAL is an officer of the British ministry, but not of the cabinet, charged with superintending the issue of all moneys voted by parliament. He is virtually the pay-master of the public service, having no control over the sums issued, paying merely on the order of the department concerned; and receives £2,000 a year as chancellor of the duchy of Lancaster. He is always either a peer or a member of the house of commons, and changes with the ministry. Of late years the office has been held in conjunction with that of vice-president of the board of trade. The paymaster-general is assisted by a deputy and a staff of clerks, the annual cost of the whole department amounting to about £25,000.

PAYMENT, in law, the discharge in money of a sum due, or, in a more general sense, the fulfilling of any obligation assumed. In order to be effectual the payment must be made by one having a right to do it, must be in kind and quantity such as will satisfy the contract, must be made to the person legally entitled to receive it and at the time and place agreed upon or implied by law. Payment may be to an agent only when the latter is authorized to receive it, either specially or by general usage or implication of law. Thus if payment is made to the wife of a creditor it is not sufficient unless it be shown that she is allowed by the husband to collect debts and transact business for him. The payment must be made in money unless it be specially provided that goods are to be received or personal service accepted. So if an agent have authority in general to receive payment, and without special authority so to do, take goods, the creditor will not be bound by the agent's receipt. The U. S. constitution gives congress the power to declare what is a legal tender; that is what may be demanded and must be taken if offered. See MONEY. Subsidiary copper coins are not legal tender. The most usual evidence of payment is a receipt, but this is only *prima facie* evidence and may be overthrown by proof of non-payment either of a part or the whole. Where the sum is sent by mail, express, or messenger, if the debtor remit in compliance with the exact instructions of his creditor, the former is relieved from responsibility for loss. The giving of a check is not such a payment as will discharge a debt until the check has been cashed; and the drawer remains liable unless there have been gross negligence on the part of the holder. But where negotiable paper is given, the creditor may signify his acceptance of the transfer as good payment. A bill of exchange drawn on a third person, and by him accepted, discharges the drawer. Where two or more parties stand in the position of joint creditors, (as in a bank deposit) the payment should not be to one unless the debtor have the direct consent of the others. But there are exceptions in the case of partnership, executors, and trustees. Thus, if money be paid to a trustee and be misappropriated, the *cestui que trust* has no claim as against the original debtor. The compromise of a debt by accepting a partial payment in discharge of the whole debt was until recently considered as not being of effect, on the ground of want of consideration and to prevent the exertion of undue pressure or taking of advantage. But it is now fully established that if the compromise be untinged by fraud or undue influence, the discharge is complete. Payment of a part may go to the jury as evidence tending to show payment of the whole. The question as to whether there have been acceptance or not is one for the jury and depends on evidence of the intent of the parties at the time. It is now generally held that any act of a third party which is accepted by the creditor as payment will act as a discharge. Payment by or to an attorney is as good as though the principal had acted. As to the time of payment, courts of law hold strictly to the rule that it must be on the exact day agreed upon, but subsequent payment may in many cases be compelled by courts of equity. If no day be specified the payment must be on demand. Where payment has been made in bank notes which proved to be forged or counterfeit, there is no discharge of the obligation. Where the notes are not forged, but the bank of issue proves insolvent, the general rule is that the loss should fall on the payer, but if the bank were solvent at the time of acceptance, and the loss occurred through the unreasonable delay of the payee in presenting the bills, he must sustain the loss. As in the case of checks and negotiable paper, the question as to what is unreasonable delay must be determined by the court in view of the special features of each case. Payment of part of a debt bars the action of the statute of limitations. In England it has been held that money paid under a mistake of law cannot be recovered, but in this country a distinction is made between *ignorantia legis* and mistake. The rules for the appropriation of payments are important. Appropriation consists in the application of money paid to one or more of several debts due from the payer to the payee. There are three cases:—where the debtor applies, where the creditor applies, and where the appropriation is made by law. The debtor has the first right to say to which debt the payment shall apply, and if he neglect to do so, the creditor may exercise the same right; but the latter cannot so apply the money as to revive debts barred by the statute of limita-

tions. Where the payment is a forced one, as upon judgment and execution, the money must be applied *pro rata* upon all claims. When the appropriation is made by order of the court, it is usual to prefer the least secured debt, but in other respects the debtor is usually favored, as in applying money to a mortgage rather than to a contract debt.

PAYN, James, b. Cheltenham, Eng., 1830; graduated at Cambridge, 1854, and adopted literature as a profession. He published two youthful vols. of poems; contributed largely to periodicals; and in 1858 became editor of *Chambers's Journal*. His novel of *Lost Sir Massingberd*, which he contributed to that magazine, is said to have largely increased its circulation. Since then he has published numerous novels, the best known of which are *Cecil's Tryst*, *Fallen Fortunes*, *What he Cost Her*, *Less Black than We're Painted*, *By Proxy*, *A Grape from a Thorn*, *Gleams of Memory* (1894), *In Market Overt* (1895), etc. In 1882–96 he was editor of the *Cornhill Magazine*.

PAYNE, Henry B., b. Hamilton, N. Y., 1810; graduated at Hamilton coll., 1832, and began to practice law at Cleveland, O., 1834; served in the O. senate, 1849–50; was the dem. candidate for U. S. senator, 1851, and for gov. 1857. He was elected to the XLIVth congress by a fusion of democrats and liberal republicans. He was elected U. S. senator in 1884. He d. in 1896.

PAYNE, John Howard, 1792–1852; b. in New York. He showed great precocity, and at 13 years of age, while a clerk in a mercantile house in New York, secretly edited a weekly paper, *The Thespian Mirror*. In 1807 he issued 25 numbers of a periodical called *The Pastime*. He was at that time a student of Union college, but the bankruptcy of his father led to his departure from this institution before completing his collegiate course. Having evinced considerable dramatic ability, he decided to go on the stage, as the best means of supporting the family. He made his début at the Park Theatre, New York, Feb. 26, 1809, as "Young Norval." This enterprise proved an artistic and pecuniary success, and he subsequently appeared before large and enthusiastic audiences in Boston, Philadelphia, and Baltimore. In 1813 he sailed for England, and made his first appearance in London at Drury Lane theater as Master Payne, "the American Roscius," in his original part of Young Norval. His performances were well received by the public. After this he supported himself in England as actor, manager, and playwright, but owing to his lack of business ability was often in financial embarrassments. He adopted many plays from the French, and produced a number of original plays, including *Brutus*, *Thérèse*, *Virginius*, and *Charles II*. But it is as the author of *Home, Sweet Home*, (adapted to an old Sicilian melody) which occurs in his play *Clari, or the maid of Milan*, that Payne has acquired a lasting reputation. The publishers of this song are said to have cleared by it, for the benefit of Charles Kemble, the manager of the theater, 2,000 guineas within 2 years after its first publication; and by the year 1832 it was computed that more than 100,000 copies had been sold. In 1826–27, Payne edited in London a periodical, the *Opera Glass*, and returned to America in 1832. In 1841 he was appointed American consul at Tunis, Africa, recalled in 1845, and re-appointed in 1851. He died there April 10, 1852, and the United States government has erected a monument over his remains in the cemetery of St. George at Tunis. There is also a bust of him in Prospect Park, Brooklyn, erected through the efforts of his biographer, Gabriel Harrison, in connection with the Faust club of that city. In 1815 he published a selection of juvenile poems, *Lisping of the Muse;* of his fugitive writings the best known are a series of papers on *Our Neglected Poets;* and an account of East Hampton, published in the *Democratic Review*. In 1883 his remains were removed from Tunis to Washington.

PAYSON, Edward, d.d., 1783–1827; b. N. H.; graduated at Harvard college in 1803; was for three years teacher of an academy in Portland, Me.; then studied theology with his father, the Rev. Seth Payson, pastor at Rindge, N. H.; was ordained colleague of Mr. Kellogg, minister of the congregational church at Portland, in 1807, and in 1811 became the sole pastor, remaining there until his death. Several calls received from Boston and New York he declined. His labors were very successful, over 700 having been added to his church. He had great breadth of intellect, a rich imagination, familiar acquaintance with the Scriptures, and intense zeal in the work of the ministry. His complete works were published in 1859, in 3 vols., with a memoir by the Rev. Dr. Cummings.

PAYTA, a seaport of Peru, at the head of a very safe bay between cape Blanco and Sechura bay; lat. 5° 5′; connected by railway with Piura; pop. under 4,000.

PAZ (La) **DE AYACU′CHO**, a t. of Bolivia, South America, capital of a dep. of the same name, about 20 m. from the s. shore of lake Titicaca, is situated on the e. declivity of the Andes, at an elevation of 12,000 ft. above the sea, on both sides of a deep ravine, here crossed by nine bridges. The whole city is subdivided into sections by numerous ravines. The streets are generally irregular and steep; there are some good public buildings, several educational institutions, a noble cathedral, and many other churches. It is the seat of a bishop and a university. La Paz is the largest city and the principal commercial emporium of Bolivia—the exports consisting of bark, copper and alpaca wool; and the imports of manufactured goods, the bulk of which comes through Peru. This city, whose original name was Nuestra Señora de la Paz, was founded in 1548. The name was changed in 1825 to its present form, in

honor of the national victory of Ayacucho (q.v.). The population in 1892 was given as 45,007, the greater part of which was Indian.

PEA, *Pisum*, a genus of plants of the natural order *Leguminosæ*, suborder *Papilionaceæ*, closely allied to the genus *Lathyrus* (q.v.), from which it differs chiefly in the triangular style. Two species, supposed to be natives of the s. of Europe and of the east, are very extensively cultivated for their seeds (peas), which are the best of all kinds of pulse; the COMMON PEA or GARDEN PEA (*P. sativum*) in gardens, and the FIELD PEA (*P. arvense*) in fields; both of them climbing annuals, with pinnate leaves, ovate leaflets, and branching tendrils in place of a terminal leaflet; the garden pea distinguished by having two or several flowers on each flower-stalk, the flowers either red or white, more generally white, and the seeds subglobular; the field pea having one flower on each flower-stalk, the flowers always red, and the seeds angular from crowding and compression in the pod. But it is not improbable that they are truely one species, of which the garden pea has, through cultivation, departed furthest from the original type. Peas have been cultivated in the east from time immemorial, although the ancient Greeks and Romans do not seem to have been acquainted with this kind of pulse, the cultivation of which was apparently introduced into Europe very early in the middle ages; and its cultivation extends from warm climates, as India, even to the Arctic regions, the plant being of rapid growth and short life. The seeds of the garden pea are used for culinary purposes both in a green and in a ripe state; also the green succulent pods of some varieties, known as sugar peas or wyker peas, in which the membrane lining the inside of the pod—parchment-like in most kinds—is much attenuated. Field peas are used both for feeding cattle and for human food. For the latter purpose, peas are often prepared by being *shelled*, or deprived of the membrane which covers them, in a particular kind of mill; they are then sold as *split peas*, and are much in use for making *pea soup*. They are also ground into meal, which is used in various ways, chiefly for making a kind of pottage and of unleavened bread. In the countries bordering on the Mediterranean, peas are roasted in order to eat.

There are innumerable varieties both of the field pea and the garden pea, those of the latter being so much the products of horticultural art, that they cannot be preserved without the utmost attention. Some of the kinds of garden peas have long stems, and require for their support stakes of six or eight feet in height; others are of humbler growth; and certain dwarf kinds, preferred as most convenient in many gardens, succeed very well without stakes. The largest kinds are sown in rows about four feet asunder. In Britain, garden peas are sown at different times from February to June, in order to secure a supply of green peas during a considerable part of summer and autumn; and in the southern parts of the island they are also sown in the end of autumn, a very little protection being sufficient for them during the winter. Certain small kinds, of very rapid growth, known as *early peas*, are preferred for the first sowings, although less productive than many others. The varieties known as *mammoth peas* are remarkable for their size and tenderness in a green state, but shrivel as they ripen.

Branches of trees are generally used for pea-stakes, when they can be obtained, and nothing can be better; but in lieu of them, strings are sometimes stretched between poles along the rows. Field peas are sometimes sown alone, and allowed to support each other, where the soil is not very rich, but are very generally sown with beans, to which they cling.

Chalky and other calcareous soils are particularly suitable for peas, and in other soils a good field crop is seldom obtained unless the land has been well limed, or manured with gypsum. The free use of lime is supposed, however, to be unfavorable to the quality of garden peas intended to be used green.

Peas are cultivated to a considerable extent as a field crop in America, but are best adapted to those districts in which the climate in least moist, the seeds being very apt to grow in the pods when moist weather prevails in autumn, by which the crop is injured or destroyed. The most productive kinds, being also in general the most bulky in straw, are very apt to lodge before the pods are filled, in wet seasons, and particularly on rich land. The crop is therefore rather a precarious one.

The haulm or straw of peas is used for feeding cattle; and for its sake, field peas are often reaped before they are quite ripe, great care being taken in stacking the straw to provide for ventilation, so that it may not *heat*. Pea haulm is more nitrogenous and more nutritious than hay.

Land to be sown with field peas should be very *clean*, and in particular free of couch grass; otherwise the best management cannot prevent its becoming more foul whilst bearing the pea crop. The seed ought always to be sown in rows, twelve inches apart, or, in rich soils, eighteen or twenty inches apart. Various means are employed for sowing peas; they are not unfrequently plowed under each second furrow; but the seed ought not to be buried more than four inches under the surface, and indeed that depth is too great; although many farmers sow their peas deeper than they otherwise would, to place them beyond reach of wood pigeons. All possible means ought to be used to keep the land free of weeds. In some districts, peas are generally sown broadcast, which renders it impossible to do anything for this purpose. In the harvesting of peas, the sheaves are generally left loose till the haulm is somewhat dry. In drying, it shrinks

very much. Broadcast peas are often cut with the scythe, and the harvesting of them is managed much as that of hay.— *Winter field peas*, a variety with very small seeds, are much cultivated in France and Germany, being sown in October, enduring the severest frosts without injury, and ripening very early.

Besides being one of the most important agricultural and horticultural crops, peas are largely imported into Britain, the quantity sometimes reaching 120,000 quarters. They are shipped from Denmark, Prussia, the Hanse Towns, Holland, Morocco, United States, British North America; and of these, Denmark and the North American colonies send the greater part. As an article of food, if not taken too often or without other food, peas are very valuable, as they contain a large percentage of *casein*, which is a flesh-forming principle. This principle in the pea has been called *legumin*, but chemists are now generally agreed that it is identical with the casein of cheese. The following is an analysis of 100 parts of pea meal:

Water	14.1
Casein	23.4
Starch	37.0
Sugar	2.0
Gum	9.9
Fat	2.0
Woody fibre	10.0
Mineral matter	2.5
	100.0

The unripe peas of the garden varieties are amongst our most esteemed vegetables, and the meal of the white or yellow varieties used in soups is a highly nutritious and agreeable food.

A plant found on some parts of the shores of Britain, as well as of continental Europe and North America, and known as the SEA PEA, has been commonly referred to the genus *pisum*, and called *P. maritimum*, although botanists now generally refer it to *lathyrus*. It much resembles the common pea; has large reddish or purple flowers on many-flowered stalks; and its seeds have a disagreeable bitter taste. Its abundance on the sea coast at Orford, in England, is said to have saved many persons from death by famine in 1555. The other species of *pisum* are few. But the name pea is often given to species of other papilionaceous genera. The SWEET PEA and EVERLASTING PEA are species of *lathyrus*. The CHICK PEA (q.v.) is a species of *cicer*.

PEA BEETLE, or PEA CHAFER, *Bruchus pisi*, a coleopterous insect, very destructive to crops of peas in the s. of Europe and in North America. It is about a quarter of an inch long, black, variegated with bright brown hairs, and with white spots and dots on the wing-cases. It lays its eggs in the young pods, one for each pea, and the larva eats its way into the pea, and completely hollows it out. See illus., BUTTERFLIES, ETC., vol. III. p.

PEABODY, a town in Essex co., Mass.; on the Boston and Maine railroad; 2 miles e. of Salem. It contains West Peabody, South Peabody, North Peabody, and several other villages, and has electric railroad communication with Lynn, Salem, and Danvers, national and savings banks, high school, the Peabody institute with library, Sutton reference library, and manufactories of morocco, leather, sheepskin, boots and shoes, electric supplies, wool, thermometers, etc. The town was formerly South Danvers; name changed in honor of George Peabody in 1868. Pop. '90, 10,158.

PEABODY, ANDREW PRESTON, D.D., LL.D., b. Mass., 1811; graduated at Harvard college in 1826, and was tutor in mathematics there. In 1833 he was settled over a Unitarian church in Portsmouth, N. H., where he remained till 1860, when he became Plummer professor of Christian morals in, and chaplain of Harvard university, which position he resigned in 1881. He edited the *North American Review*, 1854–63. Among his numerous works are *Lectures on Christian Doctrine* (1844); *Moral Philosophy* (1873); *Christianity and Science* (1874); *Christian Belief and Life* (1875). As a thinker, preacher, and writer, standing firm in the Christian faith, with abounding charity, presenting careful thought with natural rhetorical grace, he won esteem from men of various theological opinions; while, as the pastor in the university, his influence was beneficent over successive classes of students. He d. in 1893.

PEABODY, ELIZABETH PALMER, b. Mass., 1804; educated in Salem, and in 1820 became a teacher in Boston. She was one of the first to introduce object-teaching into schools, and through life did much to spread kindergartens and the views of Froebel in the United States. She published many works of an educational character, particularly on kindergarten work. She d. in 1894.

PEABODY, EPHRAIM, D.D., 1807–53; b. N. H.; educated at Bowdoin college, and studied theology at the Harvard divinity school. He was settled over a Unitarian church in New Bedford, 1838–46, when he became pastor of King's chapel, Boston, where he remained till his death. He was the founder of the Boston Providence society. A selection from his writings was published in 1858 under the title of *Christian Days and Thoughts*.

PEABODY, GEORGE, an American merchant whose name deserves to be held in remembrance on account of his munificent philanthropy, was b. at Danvers, Mass., Feb. 18, 1795. His parents were poor, and his only education was received at the district school. At the age of 11 he was placed with a grocer, and at 15 in a haberdasher's shop in Newburyport. When 22 years old, he was a partner with Elisha Riggs in Baltimore. In 1827 he first visited England, where he settled permanently ten years later. Withdrawing from the Baltimore firm in 1843, he established himself in London as a merchant and money-broker, and accumulated a large fortune. As one of three commissioners appointed in 1848 by the state of Maryland to obtain the restoration of its credit, he refused all payment, and received a special vote of thanks from the legislature of that state. In 1851 he supplied the sum required to fit up the American department at the great exhibition. In the following year he sent a large donation, afterwards increased to $270,000, to found an educational institute, etc., in his native town of South Danvers (now called Peabody). He contributed $10,000 to the first Grinnell Arctic expedition; $1,400,000 to the city of Baltimore for an institute of science, literature, and the fine arts; $8,000,000 for the promotion of education, endowment of libraries, etc., in the United States. From 1862 to 1868, he gave £350,000 for the benefit of the London poor, and in his will he left £150,000 for the same purpose; half a million in all, which has been employed in building dwellings for the working-classes. He died in London in 1869. See PEABODY EDUCATIONAL FUND.

PEABODY EDUCATIONAL FUND. In 1867 the eminent philanthropist George Peabody (q.v.) made a gift of $1,000,000, with $1,100,000 Mississippi state bonds, to be dispensed by them for promotion of "intellectual, moral, or industrial education in the most destitute portions of the southern states," its object being not so much to create new schools as to strengthen or resuscitate old ones. In 1869 Mr. Peabody contributed another million dollars and $384,000 Florida bonds. The trustees (a corporate body) had authority to expend 40 per cent. of the principal during the first two years, after which the amount was to remain unchanged for thirty years, when they might close the fund, giving not less than ⅔ for educational purposes and the remainder for literary.

The rules guiding the action of the trustees may be summarized thus: 1. Schools aided must have at least 100 pupils, with a teacher for every 50, be graded, and open 10 months yearly. 2. Trustees to act in unison with state authorities, and co-operate with school superintendents. 3. The largest sum allowed to a school of 100 pupils to be $300; of 200, $600; of 300, $1000. 4. Every grant to be made on condition of the district paying twice as much. 5. Limited aid to normal schools by grants and scholarships for training teachers.

PEABODY, NATHANIEL, 1741–1823, b. Mass.; studied medicine with his father, practiced for some years at Leominster, Mass.; and in 1761 moved to Plaiston, N. H., where he soon obtained a large practice. In 1774 he resigned the commission of lieut. col. of militia which he held from the king, and the same year assisted in the capture of fort William and Mary. He was afterwards a member of the legislature, and, as chairman of the committee of safety, delegate to the New Haven convention of 1779, and state adjutant-general he rendered valuable services to the revolutionary cause. In 1779 he was a delegate to congress and, 1780–98, filled many positions of honor, such as member of the legislature, senator, speaker of the house, and major-general. He was one of the founders of the state medical society of New Hampshire. Toward the end of his life he was confined several years in prison for debt.

PEABODY, OLIVER WILLIAM BOURN, 1799–1848; b. N. H.; twin brother of William O. B.; graduated at Harvard in 1816, read law at the Harvard law school, and practiced at Exeter, N. H., 1819–30, which town he represented in the state legislature. He settled in Boston in 1830, was associated with Alexander H. Everett in the editorship of the *North American Review*, and was an editor of the *Advertiser*. He was register of probate for Suffolk co., 1836–42, when he became professor of English literature in Jefferson college, Louisiana. He studied theology, and in 1845 was settled over the Unitarian church in Burlington, Vermont. He published an edition of Shakespeare, 1844, and wrote the lives of Gens. Putnam and Sullivan for Sparks's *American Biographies*.

PEABODY, SELIM HOBART, PH.D., LL.D., b. Vt., 1829; graduated at the univ. of Vermont, 1852; became professor of mathematics and civil engineering in the polytechnic college of Pennsylvania, at Philadelphia, 1854; principal of high school at Fond du Lac, Wis., 1859; superintendent of schools, Racine, Wis., 1862; professor of physics, Chicago high school, 1865; of physics and civil engineering, Massachusetts Agricultural college, at Amherst, 1871; of mechanical engineering and physics, in the university of Illinois, at Urbana, 1878; literary editor, American Book Exchange, New York, 1880; from which in the same year he was called to the presidency of the Illinois university, a position which he resigned in 1892 to assume a directorship on the World's Fair Committee. Among his published writings are: *Elements of Astronomy; New Practical Arithmetic;* and *Cecil's Books of Natural History.*

PEABODY, WILLIAM BOURN OLIVER, D.D., 1799–1847, b. N. H.; educated at Harvard, and from 1820 till his death settled over the Third Congregational church (Unitarian) in Springfield, Mass. His *Literary Remains* were published in 1850. He was of a nature gentle yet strong, with poetic sensibilities, fine literary taste and spiritual fervor.

The well-known hymn, "Behold the western evening light," is a specimen of his verse. His sentiments were evangelical.

PEACE RIVER, in the northwest territories of Canada, rising in about lat. 50° n., flowing n. and n.e. for about 1000 m. into Great Slave lake. It is navigable for the greater part of its course, and from near lake Athabasca to its mouth is known as Slave river.

PEACE, OFFENSES AGAINST THE PUBLIC, are those offenses which consist in either actually breaking the peace or constructively doing so by leading directly to a breach. These offenses are now usually known under the heads of unlawful assemblies, seditious libels and slanders, riots, affrays, challenges to fight, forcible entry and detainer, and libel and slander. Those who take part in an unlawful assembly commit a misdemeanor against the public safety. All persons assembled to sow sedition, and bring into contempt the constitution, are in an unlawful assembly. Thus it was held that an attempt to hold a national convention was illegal, for it was impossible to anticipate with certainty the peaceful result of such a meeting. It is, however, somewhat difficult to define precisely what amounts to an illegal assembly, except by saying that it points to some course inconsistent with the orderly administration of the laws. It is the duty of all individual citizens to resist and oppose any unlawful assembly; but the duty rests primarily with the magistrates of the district, who are indictable for breach of duty in not taking active and immediate steps to put down riots. Thus the mayor of Bristol was indicted for not suppressing the riots at the time of the Reform bill. The magistrates ought to call at once upon special constables to be sworn in, and if these are insufficient, to call for the aid of the military. Seditious libels are also offenses against the peace, as inciting directly to a breach. Such are libels vilifying the sovereign or the houses of parliament, or the courts of justice, or even a foreign sovereign, as in the case of Peltier, who was tried for a libel against the emperor Napoleon I., the tendency of such a libel being to breed misunderstanding between our own sovereign and the foreign sovereign. A riot is the most active form of an offense against the public peace. To constitute a riot, there must be at least three persons engaged together in pursuance of an illegal purpose. Riots often originate in an attempt to redress summarily some private wrong. On such an occasion, before extreme measures are resorted to, and as a test of the good faith of those who are spectators, instead of parties, and by way of full notice to all concerned, the justices of the peace may read the riot act, 1 Geo. I. st. 2, c. 5, which commands all persons to disperse within one hour after a proclamation is read, otherwise they will be guilty of felony. Persons not removing within one hour thereafter may be arrested, and carried before a justice, and committed to prison. It is, however, possible that the justices may make a mistake in thinking that to be an illegal assembly which is not so, for the mere reading of the riot act does not alter the character of the assembly, and accordingly if the party arrested prove at the trial that it was no illegal assembly he will be discharged. An affray is also an offense against the public peace, being a public assault, i.e., an assault committed in presence of third parties, for this is apt to lead to further breaches of the peace by others joining in it. Thus prize-fights and duels are affrays, and all present at them are principal offenders, and may be arrested by a constable and bound over to keep the peace, and punished by fine and imprisonment besides. So challenges to fight, provocations to fight, and forcibly entering into a house, are misdemeanors against the public peace. The laws in the U. S. on this subject are identical with those of England.

PEACH, *Amygdalus Persica*, a tree much cultivated in temperate climates for its fruit; a native of Persia and the n. of India; of the same genus with the almond (q.v.), and distinguished by oblongo-lanceolate serrulate leaves; solitary flowers, of a delicate pink color, appearing before the leaves; and the sarcocarp of the drupe succulent and tender, not fibrous as in the almond. This difference in the drupe has been made by some the ground of a generic distinction, but there are intermediate states, so that others have doubted if the peach and almond are even specifically distinct. The nectarine differs from the peach only in having a smooth fruit, whilst that of the peach is downy or velvety, and is a mere variety, probably produced and certainly preserved by cultivation. Both peaches and nectarines are divided into *freestones* and *clingstones*. In the former the flesh of the fruit parts from the stone; in the latter it adheres to it. The freestone peach is the *pêche* of the French, the clingstone peach their *pavie*, the freestone nectarine they call *pêche lisse*, and the clingstone nectarine *brugnon*. Of all these there are many subvarieties, the finer ones being perpetuated by budding; which in Britain is generally on plum or almond stocks. There is a remarkable variety of Chinese origin, with the fruit compressed and flattened, and with almost evergreen leaves. The peach is much cultivated in the s. of Europe, in many parts of the east, in the warmer temperate parts of North and South America, in Australia, etc., as a standard tree; in general, it is rather a small tree with a full head; in Britain, it is generally trained on walls, and in the northern parts of it on flued walls or in hot houses, although even in Scotland excellent peaches are ripened on open walls without artificial heat. The nectarine is rather more tender than the peach. In the extensive peach orchards of New Jersey, Pennsylvania, Maryland, and other states of North America, which sometimes contain 10,000 or 20,000 trees, the fruit is often of very inferior quality, from want of care in cultivation—the orchards being planted by simply depositing the

seed in the ground; and much of the fruit is used for making a spirituous liquor called *peach brandy*; much of it is dried in ovens, or in drying-houses furnished with stoves, or, in the more southern states, in the sun, each fruit being divided into two parts, and the stone taken out, and when dried it is sent to market to be used for pies; the refuse of the orchards is used for feeding swine. The peach is a very pleasant and refreshing fruit, and in a stewed form is useful in slight cases of constipation. The leaves, when fresh, have the smell and taste of bitter almonds; and by bruising them, mixing the pulp with water, and distilling, the *peach water* is obtained which is so much esteemed by many for flavoring articles of cookery. They have been employed as a sedative and as a vermifuge. The seeds almost entirely agree in their properties with bitter almonds; the flowers exhale an odor of bitter almonds; and both seeds and flowers are employed in the manufacture of a liqueur called *persico*.

PEACH-WOOD, or LIMA-WOOD, a dye-wood imported from South America, supposed to be the produce of a species of cæsalpinia, allied to that which yields the Nicaragua wood. It yields a fine peach color, whence its name, and is now much used in muslin and calico printing and dyeing. See BRAZIL-WOOD.

PEACOCK, or PEAFOWL, *Pavo*, a genus of gallinaceous birds of the family *pavonidæ*, or *phasianidæ*, of which only two species are known, natives of the East Indies; birds of large size, and remarkable for magnificence of plumage. The bill is of moderate size, somewhat arched towards the tip; the cheeks nearly naked; the head crested; the tarsi rather long, and armed with a single spur; the wings short; the upper tail-coverts prolonged far beyond the tail, and forming a splendid train—popularly called the *tail*—which is capable of being erected and spread out into a great disk, the true tail being at the same time erected to support it. The common peacock (*P. cristatus*) has for crest a kind of aigrette of 24 upright feathers, with slender almost naked shafts and broad tip. The tail consists of 18 brown stiff feathers, and is about 6 in. long. The train derives much of its beauty from the loose barbs of its feathers, whilst their great number and unequal length contribute to its gorgeousness, the upper feathers being successively shorter, so that when it is erected into a disk, the eye-like or moon-like spot at the tip of each feather is displayed. The lowest and longest feathers of the train do not terminate in such spots, but in spreading barbs, which encircle the erected disk. The blue of the neck, the green and black of the back and wings; the brown, green, violet, and gold of the tail; the arrangement of the colors, their metallic splendor, and the play of color in changing lights, render the male peacock an object of universal admiration—a sentiment in which the bird himself evidently participates to a degree that is very amusing, as he struts about to display himself to advantage, and labors to attract attention, affording a familiar proverbial image of ostentation and pride. When the disk is erected, the peacock has the power of rattling the shafts of its feathers against each other in a very peculiar manner, by a strong muscular vibration. The peahen is much smaller than the male bird, has no train, and is of dull plumage, mostly brownish, except that the neck is green. As in some other gallinaceous birds, the female has been known, in old age, to assume the plumage of the male. Individuals with white plumage not unfrequently occur, in which even the eye-like spots of the tail are but faintly indicated; and pied peacocks, having the deep blue of the neck and breast contrasted with pure white, are sometimes to be seen. The peacock is generally supposed to have been known to the Hebrews in the time of Solomon, but it is not certain that the word commonly translated *peacocks* in the account of Solomon's importations from Tarshish (2d Chron. ix. 21) does not signify *parrots*. It is commonly stated that it first became known to the Greeks on the occasion of Alexander's expedition to India, but Aristophanes mentions it in plays written before Alexander was born. The peacock became common among the Greeks and Romans; a sumptuous banquet in the latter days of Roman greatness was scarcely complete without it; and wealth and folly went to the excess of providing dishes of peacocks' tongues and peacocks' brains. Throughout the middle ages, also, a peacock was often presented at the tables of the great, on great occasions, the skin with the plumage being placed around the bird after it was cooked. The peacock is now common in most parts of the world; generally kept, however, except in warm countries, for ornament rather than for profit, although both the flesh and the eggs are very good. It readily partakes of all the ordinary food provided for the poultry-yard, and is fond of buds and succulent vegetables. It is hardy enough even in cold climates, except that few eggs are laid, and the young are difficult to rear, but the adult birds sit on trees or on the tops of houses, stacks, etc., during the keenest frosty nights, never, if they can avoid it, submitting to the confinement of a roosting-place, like that of the common fowl. Peacocks are found in almost all parts of India, Siam, etc., and the multitudes in which they occur in some districts are wonderful. "About the passes in the Jungletery district," col. Williamson says, in his *Oriental Field Sports*, "whole woods were covered with their beautiful plumage, to which a rising sun imparted additional brilliancy. The small patches of plain, among the long grass, most of them cultivated, and with mustard then in bloom, which induced the birds to feed, increased the beauty of the scene; and I speak within bounds when I assert that there could not be less than 1,200 or 1,500 peafowls, of various sizes, within sight of the spot where I stood for near an hour." Sir James Emerson Tennent, also, in his work on Ceylon, says that "in some of the unfrequented por-

tions of the eastern province, to which Europeans rarely resort, and where the peafowl are unmolested by the natives, their number is so extraordinary that, regarded as game, it ceases to be 'sport' to destroy them; and their cries at early morning are so tumultuous and incessant as to banish sleep, and amount to an actual inconvenience."—The harsh cry of the peacock seems to have been imitated in its Greek name *Taōs*, and probably has given rise also to the Latin *pavo* and the English *pea*-cock. The peacock, in a wild state, also roosts on trees, but makes its nest on the ground. When alarmed, as it feeds on the ground, it cannot readily take wing, and is sometimes run down by dogs or by horsemen.—The other species of the peacock is the JAPAN PEACOCK or JAVANESE PEACOCK (*P. Japonensis*, *Javanicus*, or *muticus*), a native of some of the south-eastern parts of Asia and neighboring islands. It is nearly equal in size to the common peacock, but of less brilliant although very similar plumage. The cheeks and around the eyes are yellow; the neck, and other fore parts, greenish with golden reflections. The crest is longer than that of the common peacock, its feathers less equal, and webbed along their whole length. See illus., FOWL, ETC., vol. VI.

PEACOCK, THOMAS LOVE, 1785–1866; b. England; from 1818–56 connected with the East India office, and in the last year was retired on a pension. He was a man of scholarly attainments, a friend of Charles Lamb and Shelley, and the executor of the latter. He published a number of poems, novels, and tales. Of the first *Palmyra* and *Rhododaphne* were the most noted. Of his stories, the first published, *Headlong Hall*, is usually considered the best. His works were published in 1875, in 3 vols., with a biographical sketch.

PEACOCK-STONE, the name under which the dry cartilaginous ligaments of some large lamellibranchiate mollusks, as the pearl oyster, are sold by jewelers. They are used for ornamental purposes, although not so much as formerly; and far more on the continent of Europe, particularly in Portugal, than elsewhere. They have opaline reflections, and are therefore sometimes called *black opal*.

PEA CRAB, *Pinnotheres*, a genus of brachyourous crustaceans, with nearly circular and not very hard carapace. They are of small size, and interesting from their living within the mantle-lobes of lamellibranchiate mollusks, a circumstance which was well known to the ancients, and gave rise to many curious fables. A species (*P. veterum*) is very common in the *pinnæ* of the Mediterranean, and was imagined to render important services to its host in return for its lodging, keeping a lookout for approaching dangers, against which the blind pinna itself could not guard, and particularly apprising it, that it might close its shell when the cuttle-fish came near. It is curious to find this repeated by Hasselquist, in the middle of last century, as a piece of genuine natural history. Whether the pea crab lives at the expense of the mollusk, and sucks its juices, is uncertain. It is certain that the flesh of such mollusks is palatable to pea crabs, and they eat it greedily in the aquarium. The friendship of the pea crab and the pinna is of course as fabulous as that of the lion and jackal, or of the rattlesnake, the owl, and the prairie-dog. A species of pea crab (*P. pisum*) is very common within the mantle-lobes of the common mussel on the British coasts. Species are found in almost all parts of the world.

PEALE, CHARLES WILLSON, 1741–1827, b. Md.; apprenticed to a saddler, but at the age of 26 took lessons in painting from Heselius and Copley. He afterward studied a year under Benjamin West; and returning, opened a studio in Philadelphia, and for 15 years was the only professional portrait painter in the country, one of his first productions being a picture of Washington in the uniform of a colonel in the Virginia militia. He rendered valuable services to the revolutionary cause, and painted many portraits of prominent officers. Probably no man ever had more versatile acquirements than Mr. Peale. Before his art studies, he was a saddler, harness-maker, carver, watch-maker, and silversmith. After he had learned his profession, he amused himself by becoming a naturalist, sportsman, inventor of machinery, preserver of animals, maker of musical instruments, dentist, and inventor of enamel teeth. He also established a museum, lectured on natural history, and published essays on *Wooden Bridges*, *Domestic Happiness*, and many other topics. He was one of the founders of the American academy of fine arts.

PEALE, REMBRANDT, 1778–1860; b. Penn.; at an early age showed much skill in drawing, and when but 17 produced a portrait of Washington. From 1796 to 1801, he was a portrait painter in Charleston, S. C., and then studied for three years in London, under Benjamin West, and afterwards spent some time in Paris. In 1809 he returned to America, settled in Philadelphia, painted many portraits, and two other pictures, the "Roman Daughter," and "The Court of Death;" the latter of which was exhibited throughout the country, increasing the artist's fame and possessions. Among Mr. Peale's published works were *Notes on Italy*, 1831; *Biography of C. W. Peale* (his father); and *Reminiscences on Art and Artists*.

PEA MAGGOT, the caterpillar of a small moth (*Tortrix* or *Grapholitha pisi*), which lays its eggs in young pods of peas. The caterpillar lives in the pods and eats the peas. This moth is very common in America, and in wet seasons the pods of peas are often found very full of its caterpillar.

PE'AN, (old Fr., *pannes*, furs), one of the furs borne in heraldry, differing from ermine only in the tinctures; the ground being sable, and the spots of gold.

PEA ORE, a form of compact brown iron ore (hydrated peroxide of iron), consisting of round smooth grains, from the size of mustard-seed to that of small pease. Sometimes the grains are still smaller and flattish. This iron ore is very abundant in some places in France, and is smelted.

PEANUT. See ARACHIS, EARTH-NUT.

PEAR *Pyrus communis*, a tree of the same genus with the apple (see PYRUS), and like it one of the most extensively cultivated and valuable fruit-trees of temperate climates. The leaves are ovate, serrated, smooth on both surfaces, and without glands; the flowers are produced in corymbs, which may almost be called umbels, and are smaller than those of the apple; the styles are distinct, and not combined at the base, as in the apple; and the fruit is hemispherical at one end, tapering gradually away, more or less rapidly, to a point at the other. The pear-tree grows wild in woods and copses in Britain, on the continent of Europe, and throughout the temperate parts of Asia. In its wild state it is usually either a large shrub or a small tree, thorny, and with small austere fruit. In cultivation it is without thorns, becomes a tree of 40 or 50 feet high, sometimes more; and its stem attains a diameter of three feet. Cultivation has wrought even greater changes in the size and quality of its fruit. The pear has been cultivated from remote antiquity. Its cultivation was probably introduced into Britain by the Romans. The cultivated varieties are extremely numerous; and many new ones of great excellence have recently been produced. The *jargonelle pear* may be mentioned as one of the most esteemed of the varieties long known in Britain. Some of the kinds called *bergamot* and *beurré* are highly esteemed. Many new kinds have recently been introduced into Britain from France and Belgium. The varieties of pear differ much in hardiness and in fitness for particular soils; although a deep, moderately strong, dry, loamy soil is the best for this fruit. The finer varieties are cultivated in Britain as wall-trees. Pears succeed well as espaliers. They are generally grafted on seedling stocks of the wild pear, but sometimes on the rowan, and sometimes on the quince. Pears grafted on quince stocks are the best for shallow soils. The flowers and fruit of the pear are mostly produced on spurs, which spring from branches of more than one year old. Various modes of training and pruning are practiced for pear-trees, Among the varieties of pears are some which ripen early in autumn, and some which do not ripen till the beginning of winter, and which even require to be mellowed by keeping for a short time; whilst some of the kinds cannot easily be kept for more than a few days. In general, pears cannot be kept so long nor so easily as apples. Pears are sometimes made into a preserve with syrup; and sometimes cut into pieces, and dried in the sun or in an oven, to be afterwards used in pies, a practice very prevalent in France.—A very agreeable fermented liquor called *perry* is made from pears, in the same manner as cider from apples; and pear orchards for this purpose are to be seen in some parts of England, especially in Worcestershire and Herefordshire. The varieties of pear cultivated for making perry are all rather austere, and those which yield the best perry are far too austere to be palatable.—The wood of pear-tree is reddish, very hard, fine-grained, and valuable to turners and joiners. It is often dyed black in imitation of ebony, which it then greaty resembles.

Besides the varieties of pear usually referred to *pyrus communis*, some are occasionally cultivated which are generally regarded as distinct species. Such are the AURELIAN PEAR (*P. Salvifolia*), a native of France, with leaves much narrower than the common pear, and a long fruit, which is used for making perry; the SNOWY PEAR (*P. nivalis*), a native of the Alps of Austria, with oval obtuse leaves, white and silky beneath, and a globose fruit, which is very acid till it becomes quite ripe, or is beginning to decay, when it is very sweet; the SAND PEAR (*P. Sinensis*), a native of China and Cochin-China, with heart-shaped, shining, almost evergreen leaves, and apple-shaped warted fruit, very gritty, and fit only for baking, cultivated in gardens in India, but hardy in Britain. The PASHIA. (*P. pashia* or *P. variolosa*), is a native of the Himalaya; the fruit of which is only edible when bletted or partially decayed. The PALTOO (*P. lanata*) is another Himalayan species with edible fruit.

PEAR, PRICKLY. See PRICKLY PEAR.

PEARL, a peculiar product of certain marine and fresh water mollusks or shell-fish. Most of the molluscous animals which are aquatic and reside in shells are provided with a fluid secretion with which they line their shells, and give to the otherwise harsh granular material, of which the shell is formed, a beautifully smooth surface, which prevents any unpleasant friction upon the extremely tender body of the animal. This secretion is evidently laid in extremely thin semi-transparent films, which, in consequence of such an arrangement, have generally a beautiful iridescence, and form in some species a sufficient thickness to be cut into useful and ornamental articles. The material itself in its hardened condition is called *nacre* by zoologists, and by dealers, mother-of-pearl (q.v.). Besides the pearly lining of the shells, detached or generally spherical or rounded portions of the nacre are often found on opening the shells, and there is great reason to suppose these are the result of accidental causes, such as the intrusion of a grain of sand or

other substance, which by irritating the tender body of the animal, obliges it in self-defense to cover the cause of offense, which it has no power to remove; and as the secretion goes on regularly to supply the growth and wear of the shell, the included body constantly gets its share, and thereby continues to increase in size until it becomes a pearl. The Chinese avail themselves of the knowledge of this fact to compel one species of fresh water mussel, *unio hyria*, to produce pearls. In order to do this, they keep the unios in tanks, and insert between the shell and the mantle of the animal either small leaden shot or little spherical pieces of mother-of-pearl. These are sure to receive regular coatings of the nacreous secretion; and after a time look like pearls formed under ordinary circumstances. These curious people also practice another trick upon these animals; they insert small images of the Buddha stamped out of metal, which soon become coated with the pearl secretion, and are cemented by it to the shells; to those ignorant of its origin, the phenomenon is a supernatural testimony to the truth of Buddhism. Examples of these curosities are to be found in many of our museums.

A plan of making pearls was suggested to the Swedish government by Linnæus. It consisted in boring a small hole through the shell of the river mussel, and inserting a grain of sand, so as to afford a nucleus for a pearl. The plan at first succeeded sufficiently well to prove its practicability, and he was rewarded by a sum of money (£450), but it failed as a profitable speculation, and was abandoned.

The exact nature of the secretion has never been satisfactorily determined; it is, however, ascertained that it is deposited in thin films, which overlie each other so irregularly that when magnified they present the appearance of sharply serrated edges, and to this peculiar disposition of the plates, the beautiful iridescence of common pearls is attributed. Their formation was a great puzzle to the ancients, amongst whom they were very highly prized. Dioscorides and Pliny mention the belief that they were drops of dew or rain which fell into the shells when opened by the animal, and were then altered by some power of the animal into pearls. This opinion, which obtained all over the east, is thus charmingly alluded to by Moore:

> "And precious the tear as that rain from the sky,
> Which turns into pearls as it falls in the sea."

The most famous pearls are those from the east; the coast of Ceylon, or Taprobane, as it is called by the Greeks, having from the earliest times been the chief locality for pearl fishing. They are, however, obtained now of nearly the same quality in other parts of the world, as Panama in South America, St. Margarita in the West Indies, the Coromandel coast, the shores of the Sooloo islands, the Bahrein islands, and the islands of Karak and Corgo in the Persian gulf. The pearls of the Bahrein fishery are said to be even finer than those of Ceylon, and they form an important part of the trade of Bassora. These, and indeed all the foreign pearls used in jewelry, are produced by the pearl oyster (q.v.). The shells of the mollusks which yield the Ceylon, Indian and Persian ones, are sometimes as much as a foot in diameter, and are usually about nine inches. Those of the new world, although the shells are smaller and thicker, are believed to be the same species. The chief locality of the Ceylon pearl fishery is a bank about 20 m. long, 10 or 12 m. from shore, opposite to the villages of Condatchy and Arippo on the northern coast. The season of the fishery lasts about three months, commencing at the beginning of February, and is carried on under government regulations. The boats employed are open, and vary in size from 10 to 15 tons burden; they put out at night, usually at 10 o'clock, on a signal gun being fired from the fort of Arippo, and make for the government guard-vessel, which is moored along the bank, and serves the double purpose of a guard and a light-ship. The divers are under the direction of a manager, who is called the adapanaar, and they are chiefly Tamils and Moors from India. For each diver there is provided a diving-stone, weighing about 30 pounds, which is fastened to the end of a rope long enough to reach the bottom, and having a loop made for the man's foot; and in addition to this, a large net-work basket, in which to place the pearl oysters as he collects them. These are hung over the sides of the boat; and the diver, placing his foot in the loop attached to the stone, liberates the coils of the rope, and with his net-basket rapidly descends to the bottom. To each boat there is usually allotted a crew of 13 men and 10 divers, five of whom are descending while the others are resting. This work is done very rapidly; for, notwithstanding the stories to the contrary, the best divers cannot remain longer than 80 seconds below, and few are able to exceed 60. The greatest depth they descend is 13 fathoms, and usual depth about 9 fathoms. When the diver gives the signal by pulling the rope, he is quickly hauled up with his net and its contents. Accidents rarely happen; and as the men are very superstitious, their safety is attributed to the incantations of their shark-charmers, performed at the commencement of the fishing. Sir E. Tennent, however, attributes the rarity of accidents from sharks, usually so abundant in tropical seas, to the bustle and to the excitement of the waters during the fishery frightening away those dreaded creatures. The divers are sometimes paid fixed wages, others agree for one-fourth of the produce. When a boat-load of oysters has been obtained, it returns to shore, and the cargo, sometimes amounting to 20,000 or 30,000 is landed and piled on the shore to die and putrefy, in order that the pearls may be easily found. The heaps are formed in small walled compartments, the walls surrounding each being about one or two ft. in height. Several of these compart-

ments surround a small central inclosure, in which is a bath, and they slope toward this bath, and are each connected with it by a small channel, so that any pearls washed out from the putrefying mass by the rain may be carried into the bath. When the animals in the shells are sufficiently decomposed, the washing commences, and great care is taken to watch for the loose pearls, which are always by far the most valuable; the shells are then examined, and if any attached pearls are seen, they are handed over to the clippers, who, with pinchers or hammer, skillfully remove them. Such pearls are used only for setting, while the former, being usually quite round, are drilled and strung, and can be used for beads, etc. The workmen who are employed to drill the pearls also round the irregular ones, and polish them with great skill. The method of holding the pearls during these operations is very curious; they make a number of holes of small depth in a piece of dry wood, and into these they fit the pearls, so that they are only partly below the surface of the wood, which they then place in water. As it soaks up the water and swells, the pearls become tightly fixed, and are then perforated, etc. These operations are all carried on on the spot.

For many miles along the Condatchy shore, the accumulation of shells is enormous, and averages at least 4 ft. in thickness. This is not to be wondered at, when it is remembered that this fishery has been in active operation for at least 2,000 years. The place itself is exceedingly barren and dreary, and, except during the fishing season, is almost deserted; but at that time it presents an exceedingly animated spectacle; thousands of people of various countries and castes are here drawn together—some for the fishery, others to buy pearls, and others to feed the multitude. They chiefly reside in tents, so that it appears a vast encampment.

The pearls vary much in size; those as large as a pea, and of good color and form, are the best, except unusually large specimens, which rarely occur, the most extraordinary one known being the pearl owned by the late Mr. Hope, which measured 2 in. in length, and 4 in circumference, and weighed 1,800 grains. The smaller ones are sorted into sizes, the very smallest being called seed-pearls. A considerable quantity of these last are sent to China, where they are said to be calcined, and used in Chinese pharmacy. Among the Romans, the pearl was a great favorite, and enormous prices were paid for fine ones. One author gives the value of a string of pearls at 1,000,000 sesterces, or about $40,000. The single pearl which Cleopatra is said to have dissolved and swallowed was valued at $400,000; and one of the same value was cut into two pieces for ear-rings for the statue of Venus in the Pantheon at Rome. Coming down to later times, we read of a pearl in Queen Elizabeth's reign, belonging to Sir Thomas Gresham, which was valued at $75,000, and which he is said to have treated after the fashion of Cleopatra; for he powdered it and drank it in a glass of wine to the health of the queen, in order to astonish the ambassador of Spain, with whom he had laid a wager that he would give a more costly dinner than could the Spaniard.

During the occupation of Britain by the Romans that country became famous for its pearls, which were found in the fresh-water mussel of the rivers. See FRESH-WATER MUSSEL. Generally the pearls of this mollusk are small, badly colored, and often valueless; but occasionally they occur in such beauty as to rival those of the pearl-oyster. Some years ago, in the Scotch rivers, the search for pearls was prosecuted vigorously, especially by a merchant named Unger, of Edinburgh, who had brought Scotch pearls into great repute. He collected specimens ranging, as was stated, from $25 to $400 each, and formed a necklace said to be worth $1750. In Scotch pearls of the highest quality, there is a pleasing pinkish tint, which is very permanent. The fishing for pearl-mussels is by no means so dangerous and troublesome as for pearl-oysters; usually they are found in the beds of streams, shallow enough to wade in, and so clear that they can be seen at the bottom. If too deep to remove with the hand, they are easily captured by putting a stick between their gaping shells, which instantly close upon it, and can be drawn out with it. So profitable did this pursuit become that a great many persons engaged in it.

Very fine river pearls, known on the continent as Bohemian pearls, are found in the rivers of Moldau and Wottawa. There is also a fresh-water pearl fishery in Bavaria, where the river Iltz yields at times very fine specimens. Even the most inferior pearls have a market value; for pearls can only be properly polished with pearl dust, and the inferior pearls are powdered for the purpose of polishing and rounding the finer ones.

False Pearls are very admirable imitations, made by blowing very thin beads or bulbs of glass, and pouring into them a mixture of liquid ammonia, and the white matter from the scales of the bleak, and sometimes of the roach, and dace. The proper way to prepare the pearl matter is first to remove the scales of the lower part of the fish; these must then be very carefully washed, after which they are put to soak in water, when the pearly film falls off and forms a sediment at the bottom of the vessel which is removed and placed in liquid ammonia for future use. This pearl mixture, when of the best quality, is very costly, being as much as $20 or $25 per ounce. For use it is diluted with ammonia, and injected into the glass beads, so as to thinly coat them inside; afterward the better kind have melted white wax poured in, which renders them much more durable. The French and Germans produce in this way imitations of the finest oriental pearls of such beauty that the most practiced eye can hardly detect the difference. The bleak is procured in considerable quantities for this purpose from the Thames and other rivers in England. See BLEAK.

The invention of artificial pearls is due to a Frenchmen, named Jaquin, in the time of Catharine de' Medici, and the manufacture is now chiefly carried on in the department of the Seine, where great improvements have lately been made, especially in the art of giving the irregular forms of large pearls to the glass bulbs, and thus increasing the resemblance, and in removing the glassy appearance caused by the exterior glass coating, by exposing it for a short period to the action of the vapor of hydrofluoric acid. Mucilage of fine gum arabic is also used instead of wax, which increases the translucency, gives greater weight, and is not liable to melt with the heat of the wearer's body—a defect to which those filled with wax are very liable.

Roman pearls differ from other artificial pearls, by having the coating of pearly matter on the outside, to which it is attached by an adhesive substance.

PEARL, a river of Mississippi, which rises about 100 m. n.n.e. of Jackson, and, flowing s. through the state, separates it in its lower course from Louisiana, and empties into Mississippi sound, near the outlet of lake Pontchartrain. It flows nearly 300 m. through a fertile cotton country, and is navigable to Jackson, the capital.

PEARL ASHES. See POTASH.

PEARL BARLEY. See BARLEY.

PEARL OYSTER, *Avicula* or *Meleagrina margaritifera*, a lamellibranchiate mollusk, of the family *Aviculidæ*, generally found—great numbers together—attached to submarine rocks at a considerable depth on the coasts of tropical countries, and important as producing almost all the pearls and all the mother-of-pearl of commerce. It is sometimes called the PEARL MUSSEL; but the family to which it belongs differs considerably both from that of mussels and from that of oysters, the valves of the shell being unequal, the hinge-line straight and long, and the animal furnished with two adductor muscles, one of them small, and with a foot by which it produces a byssus. The pearl oyster is of an oblique oval form, longitudinally ribbed, and with concentric foliations when young which disappear when it is old. It attains a large size, and there are several varieties, the most important of which are noticed in the article MOTHER-OF-PEARL. The whole inside of the shell is covered with a thick layer of nacre or mother-of-pearl, compact and beautiful, forming indeed the chief part of the shell, and exhibiting very considerable variety of color, most frequently white, but sometimes blood-red. Pearls are formed of the same substance (see PEARL) and are generally, if not always, produced by eggs which have become abortive, and which remain lodged within the mullusk instead of being ejected into the sea.

The pearl oyster is too rank and coarse to be eaten. When taken from the sea it is commonly laid out in the sun to die, that the pearls may be sought for after the shell opens.

The pearl oyster is not the only mullusk which produces pearls. The *Placuna placenta*—an oyster (family *Ostreadæ*) with thin transparent shell, which is used in China and elsewhere as a substitute for window glass—produces diminutive pearls. The fresh water mussel (q.v.) of Britain produces pearls sometimes of considerable beauty and value; and instances have occurred of pearls being found in pinnæ, etc., and even in limpets. See illus., MOLLUSKS, vol. X.

PEARSON, JOHN, an English prelate of high celebrity, was b. in 1612 at Snoring, in Norfolk, of which place his father was rector; educated at Eton and King's college, Cambridge, where he took the degree of M.A. in 1639, and in the same year took orders, and was collated to a prebend in Salisbury cathedral. In 1640 he was appointed chaplain to Finch, lord-keeper of the great seal, and on the outbreak of the civil war became chaplain to lord Goring, and afterward to sir Robert Cook, in London. In 1650 he was appointed minister of St. Clement's, Eastcheap, London; and in 1659 published the great work by which he is now remembered, *An Exposition of the Creed.* It was dedicated to his flock, to whom the substance of it had been preached some years before in a series of discourses. The laborious learning and the judicial calmness displayed by the author in this treatise have long been acknowledged, and command the respect even of those who think his elaborate argumentation tedious and not always forcible. It is generally reckoned one of the ablest works produced in the greatest age of English theology—the 17th century. During the same year, Pearson published *The Golden Remains of the Ever Memorable Mr. John Hales of Eton.* At the restoration, honors and emoluments were lavishly showered upon him. Before the close of 1660 he received the rectory of St. Christopher's, in London; was created D.D. at Cambridge; installed prebendary of Ely and archdeacon of Surrey; and made master of Jesus college, Cambridge. In 1661 he obtained the Margaret professorship of divinity, and was one of the most prominent commissioners in the famous Savoy conference; in 1662 he was made master of Trinity, Cambridge, and in 1672 was promoted to the bishopric of Chester. The year before he had published his *Vindiciæ Epistolarum S. Ignatii*, in answer to M. Daillè, who had denied the genuineness of the epistles. It was imagined for years that Pearson had triumphed over his opponent. The history of the controversy, however (see IGNATIUS),

has shown that Daillè was right and Pearson wrong. In 1684 appeared his *Annales Cyprianici*. He died, July 16, 1686. Pearson's *Opera Posthuma Chronologica* were published by Dodwell (Lond. 1688), and his *Orationes, Conciones et Determinationes Theologicæ* contain much valuable matter, for, as Bentley used to say, Pearson's "very dross was gold." Bishop Burnet thought him "in all respects the greatest divine of his age."

PEASANT WAR, in German history, the name given to that great insurrection of the peasantry which broke out in the year 1525, and which Zschokke has described as the "terrible scream of oppressed humanity." The oppression of the peasants had gradually increased in severity, as the nobility became more extravagant and the clergy more sensual and degenerate. The example of Switzerland encouraged the hope of success, and from 1476 to 1517 there were risings here and there among the peasants of the s. of Germany. A peasant rebellion, called from its cognizance the *Bundschuh* (laced shoe), took place in the Rhine countries in 1502, and another, called the "League of Poor Conrad," in Würtemberg, in 1514, both of which were put down without any abatement of the grievances which occasioned them. The reformation, by the mental awakening which it produced, and the diffusion of sentiments favorable to freedom, must be reckoned among the causes of the great insurrection itself; although Luther, Melanchthon, and the other leading reformers, while urging the nobles to justice and humanity, strongly reprobated the violent proceedings of the peasants. The Anabaptists, however, and in particular Münzer, encouraged and excited them, and a peasant insurrection took place in the Hegau in 1522. Another, known as the "Latin war," arose in 1523 in Salzburg, against an unpopular archbishop, but these were quickly suppressed. On Jan. 1, 1525, the peasantry of the abbacy of Kempten, along with the townspeople, suddenly assailed and plundered the convent, compelling the abbot to sign a renunciation of his rights. This proved the signal for a rising of the peasants on all sides throughout the s. of Germany. Many of the princes and nobles at first regarded the insurrection with some measure of complacency, because it was directed in the first instance chiefly against the ecclesiastical lords; some, too, because it seemed likely to promote the interests of the exiled duke of Würtemberg, who was then upon the point of reconquering his dominions by the help of Swiss troops; and others, because it seemed to set bounds to the increase of Austrian power. But the archduke Ferdinand hastened to raise an army, the troops of the empire being for the most part engaged in the emperor's wars in Italy, and intrusted the command of it to the Truchsess Von Waldburg, a man of stern and unscrupulous character, but of ability and energy. Von Waldburg negotiated with the peasants in order to gain time, and defeated and destroyed some large bodies of them, but was himself defeated by them on April 22, when he made a treaty with them, not having, however, the slightest intention of keeping it. Meanwhile the insurrection extended, and became general throughout Germany, and a number of towns took part in it, as Heilbronn, Mühlhausen, Fulda, Frankfort, etc., but there was a total want of organization and co-operation. Toward Easter, 1525, there appeared in upper Swabia a manifesto, which set forth the grievances and demands of the insurgents. They demanded the free election of their parish clergy; the appropriation of the tithes of grain, after competent maintenance of the parish clergy, to the support of the poor and to purposes of general utility; the abolition of serfdom, and of the exclusive hunting and fishing rights of the nobles; the restoration to the community of forests, fields, and meadows, which the secular and ecclesiastical lords had appropriated to themselves; release from arbitrary augmentation and multiplication of services, duties, and rents; the equal administration of justice; and the abolition of some of the most odious exactions of the clergy. The conduct of the insurgents was not, however, in accordance with the moderation of their demands. Their many separate bands destroyed convents and castles, murdered, pillaged, and were guilty of the greatest excesses, which must indeed be regarded as partly in revenge for the cruelty practiced against them by Von Waldburg. A number of princes and knights concluded treaties with the peasants conceding their principal demands. The city of Würtzburg joined them, but the castle of Leibfrauenberg made an obstinate resistance, which gave time to Von Waldburg and their other enemies to collect and strengthen their forces. In May and June, 1525, the peasants sustained a number of severe defeats, in which large bodies of them were destroyed. The landgraf Philip of Hesse was also successful against them in the n. of Germany. The peasants, after they had been subjugated, were everywhere treated with terrible cruelty. In one instance a great body of them were perfidiously massacred after they had laid down their arms. Multitudes were hanged in the streets, and many were put to death with the greatest tortures. Weinsberg, Rothenburg, Würtzburg, and other towns which had joined them, suffered the terrible revenge of the victors, and torrents of blood were shed. It is supposed that more than 150,000 persons lost their lives in the Peasant war. Flourishing and populous districts were desolated. The lot of the defeated insurgents became harder than ever, and many burdens of the peasantry originated at this period. The cause of the reformation also was very injuriously affected. See Sartorius, *Versuch einer Geschichte des Deutschen Bauernkriegs* (Berl. 1795); Ochsle, *Beiträge zur Geschichte des Deutschen Bauernkreigs* (Heilbronn, 1829); Wachsmuth, *Der Deutsche Bauernkreig* (Leip. 1834); and Zimmermann, *Allgemeine Geschichte des grossen Bauernkreigs* (3 vols. Stuttg. 1841–43).

PEASE, Calvin, d.d., 1813–63; b. Conn.; graduated at the university of Vermont in 1838; became a teacher in Montpelier; was professor of Greek and Latin in the university of Vermont in 1842–55, and its president in 1855–61. In 1855 he was ordained; in 1856 was chosen president of the Vermont board of education. In 1862 he became pastor of the First Presbyterian church, Rochester, N. Y.

PEASLEE, Edmund Randolph, ll.d., 1814–78; b. N. H.; graduated from Dartmouth college 1836, and was tutor there for two years. He studied at the Yale medical school, and in 1841 began practice at Hanover, N. H. He was appointed professor of anatomy and physiology at Dartmouth college in 1842, and retained the position for nearly 40 years. He was a lecturer and professor in Bowdoin college also. In 1851 he was made professor of physiology and pathology in the N. Y. medical college, and in 1858 of obstetrics. In the latter year he began to reside in N. Y. city, where he had already obtained a large practice and a high rank, especially in obstetrics and gynecology. He was a member and officer of many medical societies of both continents, published many contributions to medical and scientific periodicals, and two books—*Human Histology* (1857) and *Ovarian Tumors and Ovariotomy* (1872).

PEA-STONE, Pi'solite, or Pi'siform Limestone, is a kind of calcareous spar or limestone, which occurs in globules from one-eighth of an inch to half an inch in diameter, imbedded in a cement of similar substance. There is generally a grain of sand in the center of each globule as the nucleus, around which it has been formed, and the concentric plates of its structure are easily visible. Sometimes the nucleus is merely a bubble of air. Pea-stone is found in great masses near the hot springs of Carlsbad, in Bohemia. See illus., Geology, vol. VI.

PEAT, a substance formed by the decomposition of plants amidst much moisture, as in marshes and morasses; and sometimes described as a kind of *humus* (q.v.), formed by the accumulation of the remains of mosses and other marsh-plants. The remains of the plants are often so well preserved in it that the species can be easily distinguished. Reeds, rushes, and other aquatic plants may usually be traced in peat, and stems of heath are often abundant in it; but it chiefly consists, in the northern parts of the world, of different species of *sphagnum* (q.v.), or bog-moss. Mosses of this genus grow in very wet situations, and throw out new shoots in their upper parts, whilst their lower parts are decaying and being converted into peat; so that shallow pools are gradually changed into bogs. It was at one time believed that bogs owed their origin to the destruction of forests, the fallen trees impeding the natural drainage, and causing the growth of those marsh-plants of which peat is formed; and this theory was supported by reference to instances supposed to be authenticated by tradition—as that of the moor of Hatfield in Yorkshire, now consisting of about 12,000 acres of peat, and said to have been a forest of firs, till "the Romans under Ostorius, having slain many Britons, drove the rest into the forest," which was then destroyed by the victors. There are, however, satisfactory proofs that peat has accumulated in many places around trees; and firs remaining in their natural position have been found to have 6 or 7 ft. of peat under their roots, although other trees, as oaks, are commonly found with their stumps resting on the soil beneath the peat. Yet it is not improbable that the destruction of forests may, in some instances, by impeding the course of the streams which flowed through them, have caused the stagnation of water from which the growth of peat resulted. Some of the largest mosses and fens of Europe occupy the place of forests, which were destroyed by order of Severus and other Roman emperors; and some of the British forests, now mosses, as well as some of those of Ireland, were cut because they harbored wolves or outlaws. The overthrow of a forest by a storm in the 17th c. is known to have caused the formation of a *peat-moss* near loch Broom, in Ross-shire. Layers of trees are not unfrequently found in peat, which seem to have been suddenly deposited in their horizontal position, and sometimes to have been felled by human hands. It is not improbable, however, that sometimes peat has been formed where the soil has been exhausted by the long-continued growth of one kind of tree. The growth of peat is often rapid: bogs have been known to increase 2 in. in depth in a year. The surface of a bog sometimes becomes a floating mass of long interlaced fibers of plants, known in Ireland as *Old Wives' Tow.* The vegetation on the surface is sometimes very green and compact, like a beautiful turf.

Peat is vegetable matter more or less decomposed, and passes by insensible degrees into lignite (q.v.). The less-perfectly decomposed peat is generally of a brown color; that which is more perfectly decomposed is often nearly black. Moist peat possesses a decided and powerful antiseptic property, which is attributed to the presence of gallic acid and tannin, and is manifested not only in the perfect preservation of ancient trees and of leaves, fruits, etc., but sometimes even of animal bodies. Thus, in some instances, human bodies have been found perfectly preserved in peat, after the lapse of centuries.

The formation of peat may be regarded as one of the most important geological changes now in evident progress. It takes place, however, only in the colder parts of the world. In warm regions, the decay of vegetable substances, after life has ceased, is too rapid to permit the formation of peat. The surface covered by peat is very extensive in all the colder parts of the world; although in the southern hemisphere no moss seems to enter into its composition; and the South American peat is said by Mr. Darwin to be formed of many plants, but chiefly of *astelia pumila,* a phanerogamous plant of the rush

family. The surface covered by peat even in England is considerable; it is greater in Scotland, and very great in Ireland. Extensive tracts are covered with peat even in the southern countries of Europe, and sometimes even near the sea; and in more northern regions, the *mosses* or *bogs* are still more extensive. For their physical characters, and the mode of *reclaiming* them, or converting them into arable land, see Bog.

Mere peat is not a good soil, even when sufficiently drained, but, by the application of lime, marl, etc., it is soon converted into good soil, yielding excellent crops. A mixture of peat is often of benefit to soils otherwise poor. And for many shrubs, as rhododendrons, kalmias, whortleberries, etc., no soil is so suitable as one in great part composed of peat; which is therefore in much request with gardeners in order to the formation of the soil for certain kinds of plants.

Peat is extensively used for fuel. The more perfectly decomposed that the vegetable matter is, and the more consolidated that the peat therefore is, the better it is suited for this use. It is the ordinary fuel of great part of Ireland, and is there almost always called *turf*, although the term turf, in its ordinary English sense, is utterly inapplicable to it. To procure peat for fuel, the portion of bog to be operated upon must first be partially dried by a wide open drain; its surface is then pared off with the spade, to the depth of about 6 in., to remove the coarse undecomposed vegetable matter; the peat is afterwards cut out in pieces (*peats*) like bricks, by means chiefly of a peculiar implement, called in Ireland a *slane*, and in Scotland a *peat-spade*, resembling a long, narrow, sharp spade, the blade of which is furnished on one side with a tongue set at a right angle to it. This implement is used by the hands alone, without pressure of the foot. The soft peats are conveyed to some neighboring place, where they are set up on end in little clusters to dry. When sufficiently dry, they are conveyed away, and may be piled in out-houses or stacked in the open air. The operation of *peat-cutting* is always performed in spring or summer.—Where peat for fuel cannot be obtained in the way just described, the black mud of a semi-fluid bog is sometimes worked by the feet of a party of men, women, and children until it acquires such a consistency that it can be molded by the hand. The process is laborious, but the fuel obtained by it is good.—In countries depending on peat for fuel, a very rainy season sometimes occasions great inconvenience, and even distress, by preventing the cutting and drying of the peat.

Peat is a light and bulky kind of fuel, and cannot be conveyed to considerable distances without too great expense. Efforts have, however, been made, both in Scotland and Ireland, to render it more generally useful, and so to promote the reclaiming of bogs by so compressing it until its specific gravity is nearly equal to that of coal. For this purpose it is first reduced to a pulp. The compressing of peat has not yet been advantageously prosecuted on an extensive scale.

Peat-charcoal, made from uncompressed peat, is very light and inflammable, and therefore unsuitable for many purposes, but for others it is particularly adapted, and no kind of charcoal excels it in antiseptic and deodorizing properties. It is also an excellent manure for many kinds of soil, and great crops have often been obtained by its use. Peat-charcoal is highly esteemed for the smelting of iron, and for working and tempering the finer kinds of cutlery. Charcoal made from compressed peat is in density superior to wood-charcoal, and is capable of being used as coke. The Irish amelioration society, some years ago, encouraged the conversion of peat into charcoal, but it seems not to have paid as a commercial speculation, although the resulting charcoal was of good quality. Various companies have been formed for the purpose of obtaining valuable products from the destructive distillation of peat. It appears from researches of sir R. Kane and others that 1000 parts of peat yield about 11 of sulphate of ammonia, 7 of acetate of lime, 2 of wood naphtha, 1 of paraffin, 7 of fixed oil, and 3 of volatile oil. The manufacture has not, however, as yet proved sufficiently profitable to be generally adopted, although the distillation of peat has, we believe, been carried on for some years at Athy, near Kildare. For further details on this subject, the reader is referred to a parliamentary *Report on the Nature and Products of the Destructive Distillation of Peat*, published in 1851, and to a paper by Dr. Paul in the 6th volume of *The Chemical News*. A more recent contribution to the subject is *The Peat Mosses of Buchan*—by the rev. James Peter, minister of Deer (Aberdeen, 1875).

Flower-pots are sometimes made of peat. It is easy to transplant flowers growing in them without loosening the earth from the roots, the pot being readily cut to pieces; and liquid manure applied outside finds its way sufficiently to the roots.

PEA WEEVIL, *Sitona crinita* and *S. lineata*, small coleopterous insects, about a quarter of an inch long, which are very destructive to crops of peas and other kinds of of pulse, devouring the leaves and other succulent parts, often soon after the plants appear above ground. Lime, soot, or wood ashes dusted over the plants protect them in some measure from the ravages of these insects; and hoeing or other stirring of the soil is beneficial, probably by destroying the eggs, larvæ, and pupæ.

PEBBLE (probably allied to *bubble*, from the sound of water running among stones), a small, round, water-worn stone of any kind; but with jewelers sometimes an agate—agates being often found as loose pebbles in streams, and those of Scotland in particular being popularly designated *Scotch pebbles*. Hence the name has come even to be extended to rock-crystal, when not in the crystalline form, and we hear of spectacles

with eyes of pebble, etc. Deposits of pebbles (in the sense of water-worn stones occur among the rocks of all periods, but the pebbles are seldom loose; they are generally cemented together by iron, lime, or silex, forming a pudding-stone of greater or less hardness. Single pebbles are sometimes found in deposits which have been formed at a distance from currents in perfectly still water, as in chalk and fine silt. They must have been floated to their places entangled in the roots of trees, or attached to the roots of large buoyant sea-weeds.—Brazilian Pebbles (so called from Brazil having been long famous for the purity of its rock crystal), are very pure pieces of rock crystal (q.v.), used by opticians for making the lenses of spectacles, etc.

PECAN'. See Hickory.

PECCARY, *Drycoteles,* a genus of *pachydermata,* of the family *suidæ,* much resembling hogs; but having a mere tubercle instead of a tail; only three toes—no external toe—on the hind-feet; the molar teeth and incisors very like those of hogs, but the canine teeth not nearly so long and not curving outwards. An approach to ruminants is seen in the stomach, which is divided into several sacs; also in the union of the metacarpal and metatarsal bones of the two greater toes into a kind of cannon bone. A glandular opening on the loins, near the tail, secretes a fetid humor. Only two species are known, both natives of South America; and, except the tapirs, the only existing pachydermata of the American continent.—The Common Peccary, Collared Peccary, or Tajaçu (*D. torquatus*), is found in almost all parts of South America; the White-lipped Peccary (*D. labiatus*) is found in many parts of it. Both are gregarious; the white-lipped peccary often assembling in very large herds, and sometimes doing great mischief to maize and other crops. The herds of the white-lipped peccary seem to follow a leader, like those of ruminants. The common peccary chiefly frequents forests, and small companies sometimes take up the abode in the hollow of a great tree. The common peccary is about the size of a small hog, grayish; the hairs alternately ringed with black and yellowish white, bristly; and on the neck longer, and forming a mane. A narrow white collar surrounds the neck. The white-lipped peccary is considerably larger, of a darker color, with conspicuously white lips. The ears are almost concealed by the hair. Both species are capable of being tamed, but are of irritable and uncertain temper. In a wild state they defend themselves vigorously against assailants, making good use of their sharp tusks, and a whole herd combine for defense. The hunter has often to take refuge from them in a tree. They are omnivorous; and if hurtful to crops, render service by destroying reptiles. Their voice is somewhat like that of the hog, but more sharp. Their flesh resembles that of the hog, but is said to be inferior. The glands on the loins must be cut out immediately after the peccary is killed, or their fetid humor infects the whole flesh. See illus., Mammalia, vol. IX.

PE-CHIH-LE. See Chih-le.

PECK, a measure of capacity for dry goods, such as grain, fruit, etc., used in America, and equivalent to 2 imperial gallons, or 554.54 + cubic inches. It is thus the fourth part of a bushel (q.v.).

PECK, George, D.D., 1797–1876; b. N.Y.; joined the Genesee conference of the Methodist Episcopal church in 1816; appointed presiding elder of the Susquehanna district in 1824; was principal of the Oneida conference seminary in 1835–40, and in the last year was elected editor of the *Methodist Quarterly Review,* which position he filled for eight years. In 1848 he was elected chief editor of the *Christian Advocate and Journal,* in New York, retaining the position for four years. He was pastor at Wilkesbarre, Scranton, Providence, Dunmore; and his public labors included a period of 60 years. His published works are *Universalism Examined; Scripture Doctrine of Christian Perfection; Rule of Faith; Reply to Bascom; Manly Character,* and *Our Country.*

PECK, Harry Thurston, PH.D., L.H.D., was born in Stamford, Conn., in 1856. He was educated at Columbia College, from which institution he graduated with honors in 1881, receiving at once an appointment to a classical fellowship. After a year spent in advanced study, he was made instructor in the department of Latin, and a little later, lecturer on Biblical Hebrew. In 1886, on the death of Prof. Charles Short, Dr. Peck was placed in charge of the Latin chair, and in 1888, after spending some time in study abroad at the University of Berlin, he was elected to the full professorship of the Latin language and literature, a position which he still holds. On the reorganization of Columbia as a university, in 1890, Prof. Peck was a member of the first University Council. He has also held the appointment of lecturer in classical philology in the Barnard College for Women. He is a member of the American Philological Society, of the American Oriental Society, of the American Folk-Lore Society, of the Archæological Institute of America, and of the New York Academy of Anthropology; and one of the incorporators of the Columbia University Press, of which he is now a Trustee. Among his published works are *The Semitic Theory of Creation* (1885), *Suetonius* (2d ed. 1893), *Latin Pronunciation* (2d ed. 1894), *A History of the Latin Language* (1894), and numerous papers, reviews, addresses, etc., besides fugitive verses, some of which will be found in Stedman's *Library of American Literature,* vol. XI. In conjunction with Prof. E. M. Pease, of Bowdoin College, Prof. Peck has brought out a series of Latin classics for college use, and since 1890 he has been Editor-in-chief of the *International Cyclopædia,* besides editing *Appleton's Atlas of Modern Geography* (1892), *Harper's Dictionary of Classical Literature and Antiquities* (1894), the *University Bulletin,* and *Classical Studies* (1895). In 1895 he published *Roman Life in Latin Prose and Verse,* and became editor of *The Bookman.*

PECK, JESSE TRUESDELL. D.D., b. N. Y., 1811; joined the Oneida conference in 1832; was principal of the Gouverneur Wesleyan seminary in 1837–41, and of the Troy conference academy at West Poultney, Vt., in 1841–48; president of Dickinson college in 1848–52; pastor of the Foundry church in Washington, D. C., two years. In 1854 he was appointed secretary and editor of the Methodist tract society; labored eight years in California as pastor and presiding elder. Returning to the east he was pastor in Peekskill, Albany, and Syracuse, and in 1872 was lected bishop. He was one of the founders of the Syracuse university. Dr. P. published *The Central Idea of Christianity; The True Woman; The History of the Great Republic Considered from a Christian Standpoint.* He d. 1883.

PECK, JOHN JAMES, 1821–78; b. N. Y.; educated at West Point, and in 1843 received the commission of lieut. in the artillery. He served at Palo Alto, Monterey, and several other battles of the Mexican war; at the assault on Molino del Rey displayed great gallantry, and was brevetted major. In 1853 he resigned his commission and became a banker in Syracuse, N. Y. He took great interest in politics, and was a delegate to the democratic national conventions of 1856 and 1860. In 1861 he was made brig.gen. of volunteers, and placed in command of a brigade of the 4th corps. He was present at the battles of Williamsburg and Fair Oaks, at the siege of Richmond, and had charge of the defense of Suffolk, Va. In 1864 he was employed in North Carolina, and the same year was given command of the forces near the Canadian border. He was mustered out in 1865, and until his death was engaged in the insurance business in New York, being for many years president of the New York state life insurance co. of Syracuse.

PECK, JOHN MASON, D.D., 1789–1858; b. Conn.; removed in 1811 to Greene co., N. Y., where he united with a Baptist church; and in 1814 became pastor of a church in Amenia, N. Y. In 1817 he was an itinerant missionary in Illinois and Missouri. He was the principal in 1830–31 of a seminary at Rock Spring, Ill. He was one of the founders of the theological seminary at Covington, Ky.; in 1843–45 he was secretary of the American Baptist publication society. From 1829 he edited for several years a periodical, *The Pioneer.* He published *The Emigrant's Guide; A Gazetteer of Illinois; Life of Daniel Boone*, in Sparks's *American Biography; Life of Father Clark*, a western preacher.

PECK, WILLIAM GUY, LL.D., b. Conn., 1820; educated at West Point, and in 1844 received a commission as lieut. in the corps of topographical engineers. From 1847 to 1855 he was assistant professor of mathematics at the military academy. In 1855 he resigned, and was made professor of physics and engineering at the university of Michigan. In 1857 he accepted the position of professor of mathematics and astronomy in Columbia college, New York, which he held till 1892. Dr. P. published *Elements of Mechanics*, 1859; an edition of Ganot's *Natural Philosophy*, 1860; and was joint editor with Davies of the *Mathematical Dictionary and Cyclopædia of Mathematical Science.* He published several text-books also. Died, 1892.

PECORA (Lat. cattle), a Linnæan order of mammalia, now generally called ruminantia (q.v.).

PECOS, a river of Texas, rises in the mountains near Santa Fé, New Mexico, runs south-easterly 600 m. through New Mexico and Texas, and flows into the Rio Grande-del-Norte, in lat. about 29° 20′ n., long. 102° west.

PECOS, a co. in w. Texas, bounded on the e. and n. e. by the Pecos river, and on the s. by the Rio Grande; about 6700 sq.m.; pop. '90, 1326, chiefly of American birth. It is well adapted to grazing, and has some good farming land. Co. seat, Fort Stockton.

PECQUET JEAN, 1620–74; b. Dieppe. He studied medicine at Montpellier, where he soon made the important discovery of the course of the lacteal vessels, including the situation of the sac, called the *receptaculum chyli*, or reservoir of Pecquet, as it is sometimes called, and the termination of the principal lacteal vessel, the thoracic duct, into the left subclavian vein. Pecquet was one of the first members of the Academy of Sciences at Paris. His principal works are: *Experimenta Nova Anatomica* (Paris, 1651); and *De Circulatione Sanguinis et Chyli Motu*, and *De Thoracicis Lacteis* (1654).

PECTEN, a genus of lamellibranchiate mollusks, commonly referred to the same family with the oyster (*ostreadæ*), which is sometimes called *pectinidæ.* The shell has neither teeth nor laminæ in the hinge; the valves are unequal, one of them being often much more convex than the other; the shape is regular; the hinge is extended by *ears*, and in most of the species both valves have ribs radiating from the umbo to the margin. Hence the name *pecten* (Lat. a comb), from the appearance which they present. The animal has a small foot; some of the species are capable of attaching themselves by a byssus; they are capable also of locomotion by opening and rapidly closing the valves, and in this way can even regain the sea from a short distance by leaping on the shore. Some of the larger species are often popularly called *clams*, a name shared by other bivalves. *P. Jacobæus*, a native of the Mediterranean, is the SCALLOP-SHELL which pilgrims were accustomed to wear in front of their hats, in token of their having visited the shrine of St. James at Compostella.

PECTIC ACID AND **PECTINE.** See FRUITS.

PECTINIBRANCHIA'TA (Lat. comb-gilled), an order of gasteropodous mollusks, having the gills composed of numerous leaflets or fringes, arranged like the teeth of a comb,

and affixed to the internal surface of a cavity which opens with a wide opening above the head. The sexes are distinct. To this order belong whelks and periwinkles.

PECTORIL'OQUY is a term of such frequent occurrence in the history of chest diseases as to require a brief notice in this work. If the stethoscope be applied to the chest of a healthy person, and he be requested to speak, the sounds of his voice will be conveyed to the ear of the observer with very different degrees of clearness, according to the part of the chest on which the base of the instrument rests. If, for example, it be applied at the top of the sternum or breast-bone the voice will reach the ear, through the tube, with tolerable distinctness. For a short distance on either side of the sternum, just below the collar-bones, and in the arm-pits, the voice is still heard, but the sound is indistinct and confused. Below the third rib, and over the remainder of the chest, the voice only produces an obscure thrilling sound, which is known as *pectoral resonance*. In certain morbid conditions the sounds of the voice seem to proceed with distinctness from the walls of the chest directly into the ear; and then, in place of the normal pectoral resonance, we have the physical sign known as pectoriloquy (from the Latin *pectore*, from the chest, and *loquor*, I speak). It occurs when a tolerably superficial excavation, of moderate or considerable size, lies under the stethoscope.

PECTOSE. See FRUIT.

PEDAGOGY or **PÆDAGOGY** (Gr. *παιδαγωγία*; *παιδαγωγός*, *παῖς*, boy, and *ἄγειν*, to lead, among the Greeks was the slave who accompanied the child of his master to the palæstra, watched over him at his games, and instructed him in personal conduct), the science of education. Pædagogy is a derived science, based principally upon psychology. The aim of the latter science is to determine the nature of complete personality in the various stages of its growth, and the laws and conditions of its development. As education is a process directed toward the most perfect development of full personality, it follows that the science of education must, of necessity, fundamentally embody psychological principles and treat of their consistent application. As a science pædagogy scarcely goes back of Herbart (1776–1841). Pestalozzi (1746–1827) inculcates the truth of the principle that all education must be based upon the laws of the development of the human soul; its methods, consequently, cannot be arbitrary, but must be founded upon the laws of nature. "The natural harmonious development of all the powers of a human being for the sake of his true moral nature" is to him the desired end. Herbart was the real founder of modern scientific pædagogy, in that he was the first to insist that a rational system of education must be fundamentally based upon a true psychology. It is the aim of the science of pædagogy to unfold, in the first place, the general idea of education by means of the scientific investigation of its nature. It must exhibit, furthermore, the particular phases under all conditions of the general subject; it must consider in all its complexities the nature of the being who is to be taught; it must determine the nature and extent of the means by which the desired growth shall be promoted, and it must decide upon the proper methods by which the matter taught shall be most profitably presented. It should include, finally, in its perfect elaboration, a consideration of the historical development of education and account for the particular systems that have arisen among the various nations of the world, in order to put us of the present into possession of the educational experience of the past.

On account of its dependence upon psychology, the detailed principles of pædagogy have been formulated in different ways, according to the psychological views held by the writer. Two of these theories have acquired especial importance. One school of writers holds to the *a priori*, or rational, method of psychology, and deduces from the original constitution of mind the principles of educational development. Man, from this standpoint, is a being in the process of development; his true nature is not already realized at birth, but has to be developed and made actual by education, which in this way helps to make real what was already possible. In the undeveloped mind nearly all is potential, and but little has been actualized. Rosencranz (1805–79), whose psychological basis is the system of Hegel, is an admirable exponent of this method. Education to him consists in the development in man of his inborn rationality. Its form is determined by the nature of mind. This system particularly emphasizes the idea of "self-estrangement" as the fundamental principle of education. Man must by education estrange himself from his animal nature and assimilate himself to his ideal nature. All culture must of necessity pass through the two stages of estrangement and its removal. Culture first develops the contrast between the strange and the familiar, in order, however, to annul it and make it well known. The aim of education is to arouse in the pupil a spiritual and ethical sensitiveness, which forbids him to look upon anything as merely indifferent. Religious education is made by this theory the last and highest form of the particular elements of education.

Another school of writers takes less into consideration the original conditions and constitution of mind, but adopts the *a posteriori* phase of mental action as a standpoint from which to observe the problems of education. These writers consider primarily the growth of mind and its continually changing content, and ignore to a great extent, or take for granted, its original conditions. This, concisely put, is the standpoint of Herbart, although, since his day, his followers in Germany have gone apart in their specific interpretation of his doctrines. Two schools in this way have arisen: one,

headed by Stoy, holding to Herbart's theory more in its original form; the other, headed by Ziller, giving it a wider and freer construction. The controlling element in the Herbartian view of the matter is the mental process of "apperception," or the assimilation of ideas. Stated in general terms, apperception, according to this formulation, is the process of giving significance to facts by relating them to knowledge already established; in other words, it is "the assimilation of ideas by means of ideas already possessed." In an ordinary act of apperception the mind holds in attention not only the new notion, but also the other idea to which it must be related in order to acquire significance. All systematic education is to be arranged on this basis. The laws of development of the mind of the child must determine the methods of instruction, which in every stage should be made to fit the particular stage of the development of mind. This theory, accordingly, demands the most perfect possible adjustment of the subject-matter of education to the mind to be educated. What the mind already holds within it becomes the continual subject of inquiry and forms the basis of all instruction, since the past experience of the individual must furnish the key to educational progress. All instruction, furthermore, by this theory shall tend directly toward the formation of moral character.

Still another standpoint from which to investigate the problems of education is that of physiological psychology. That physiology plays an important part in education is apparent. In the growth of mind the physical side is a constant element, since it is only through the senses that a knowledge of the outer world is gained. In this phase of the subject the effect of external stimulus to produce sensations of sight, hearing, touch, smell, and taste is not only investigated and the capacity of the mind for memory, association, and the like determined, but the essential conditions of bodily health are inquired into and the best means of securing the ends of educational development, in accordance with its principles, are deduced. The whole matter of school hygiene in its particular application—size and shape of rooms, lighting, warming, ventilation, furniture, and appliances—belongs here.

Chiefly from these three points of view, as described here in their essential elements, a science of education has been evolved. Both the system based upon the rational phase of psychology and that founded upon the psychology of experience must include, to no small extent, the facts of physiological psychology. The prominence given to "apperception," a particular formulation of the familiar concept of the "association of ideas," is the great distinguishing characteristic of the school which adopts the concrete phase of mental life as its standpoint.

Among the many particular problems of pædagogy three stand out with especial prominence. They are, first, with regard to the selection of the subject-matter of education, where the question to be answered is, *What* shall be taught? second, with regard to the arrangement and relationship of the subject-matter, where the question is, *When* shall it be taught? And, third, as to the method of instruction, when the question becomes, *How* shall the subject be taught?

1. Subject-matter. The ideal of education has varied within the widest limits, according to the degree of civilization and the environment of the people who have held it. By its very essence, education must, at all times, have inevitably corresponded with some recognized human need, or, at least, have proceeded in the direction of what it was felt, at a particular time and under particular circumstances, man in his full development should be. The Greeks, who may be said to have first taught education as a science, for instance, developed pre-eminently what is called the culture or humane type; the Romans the industrial or professional type. In more recent times we have had the views of the humanists, the realists, and the naturalists. Modern pædagogy presupposes a choice in the subject-matter of instruction based upon psychological needs; in other words, its aim in this direction is to determine upon a psychological basis what studies, in accord with the culture of the day, shall be taken up and in what order of succession the different parts of a study shall follow. As the choice of the subject-matter of instruction varies among different people, at different times, and under different conditions, it follows that there is no unanimity of opinion as to what this subject-matter shall be. In the American common schools, the reading, writing, and arithmetic, originally taught when schools were intended to impart only the rudiments of knowledge, have been succeeded by a traditional curriculum which includes, besides, as fundamental subjects, grammar, geography, and history. Certain German writers suggest as the subjects of elementary instruction the following nine: Object teaching, reading, writing, religion, the native language, history, geography, natural history, and mathematics. There are two principal theories as to the order in which the parts of a subject shall be presented: one the *historical* method, and the other the *concentric* method, so called. The *historical* method assumes that the child in the process of development successively passes through all the stages of culture through which the human race has passed in its historical development. The subjects of instruction, accordingly, are to be presented to the mind of the child in such a way that he may repeat, as near as may be, ideally the process that has happened really. According to Ziller, the original exponent of this method, the subject-matter is "only to be borrowed from that culture development which is parallel to the pupil's present condition of mind." All school studies are classified primarily into two groups, culture studies and nature studies. The first group comprises: history, sacred and profane; literature; art, as drawing and music; languages, native and foreign.

The second group includes: geography; natural history, physics, and chemistry; arithmetic; geometry; practical exercises; gymnastics. This theory, further, as elaborated by Ziller and Rein, insists upon the idea of *concentration*. In the culture studies, about the subjects of religion and history as a centre, all other subjects of instruction are to be arranged and so related that none shall stand by itself apart from the others. Ziller and his followers recommend, in this way, for the first year of instruction in the culture studies Grimm's *Fairy Tales*, for the second year *Robinson Crusoe*. The nature studies in the first year, for instance, are to take account of all the subjects in their particular field suggested by Grimm's *Fairy Tales*. The *concentric* method presupposes that at first a few central facts of a subject shall be selected, and then that these shall be systematically widened, like a growing series of circles, by the addition of new facts, until the entire subject is covered.

2. Co-ordination. This phase of the subject is intimately connected with the preceding, which it in reality supplements, since, in order to bring the subjects of instruction also into the desired relationship with each other, some certain order of succession must be determined upon and followed. The principle, it is apparent, is in direct disaccord with the mechanical and fixed routine still characteristic of much of our educational practice. Studies are taught by themselves and for themselves as if there were no question of connection or of interdependence. In reality this may be shown almost everywhere to exist. History and geography, for instance, may be readily correlated by making the scene of a certain historical event, or series of events, the subject of instruction in geography; it is an easy matter to discover associations, again, between natural history and geography; arithmetic, in a similar way, may find fitting material in natural history, geography, and history. Three general plans for the co-ordination of studies have been recognized. (1) The subordination of most branches to a few important ones. There is no unanimity of opinion, however, as to what these branches should be. History and literature, according to Ziller, should furnish the logical core; others see in the sciences the central subjects. (2) The acceptance of universal scientific law as the basis for the co-ordination of studies. The real subjects, according to this theory, all logically connected, are furnished by the natural sciences and history, out of which all formal subjects, reading, writing, drawing, and the like, are to grow. (3) The co-ordination of independent branches through their natural relations. To every important group of subjects, under this system, is left its own particular principle of development, but a proper selection will bind all together by association.

3. Method. A system of education based upon psychological principles it is evident must embody methods of exposition which shall take full and accurate account of the conditions involved, such as the limitations in knowledge at any certain stage, the power of comprehension of the learner, his present acquirements, etc., and his interest in that which must constitute the subject-matter of his education in order that his mind shall be aroused to continued educational effort. There is, again, in this phase of pædagogy no general unanimity of opinion. What has been called the "gymnastic" system of education assumes that the mind can be trained by a minimum of concrete knowledge, and that the power gained in one department of knowledge may be transferred to any other; as, for instance, when in physics mathematics is made the basis of the work. This theory makes much of the so-called disciplinary studies; formal culture, or discipline of the mind, being held in view as a fundamental condition of education. The Herbartians, on the other hand, deny the correctness of the theory of mental discipline. They point out three necessary phases in the method of instruction as based upon the idea of apperception. Since all knowledge must start with the individual notion, a sound method must consider: (1) The assimilation of individual notions; as it is only possible to arrive at general laws through individual facts, (2) the inductive approach from individual to general notions; and, finally, since it is necessary for their proper utilization to apply these principles practically, (3) the return from general to individual notions. In the application of the details of method—whether knowledge shall be imparted objectively or by definition, whether descriptively or genetically, whether inductively or deductively, or whether methods with regard to the subject-matter shall be analytic or synthetic—the various systems of education are still widely apart.

PEDAL (Lat. *pes*, a foot), any part of a musical instrument acted on by the feet. The pianoforte, the harp, and the organ are furnished with pedals, which, however serve an entirely different purpose in each instrument. In the pianoforte their object is to effect a change in the quality or intensity of the sound; the damper pedal prolongs the sound

after the finger is lifted from the key, and the shifting or *una corda* pedal softens the tone. The pedals of the harp are the means by which the chromatic changes of intonation are effected. In the organ the pedals are keys put in action by the feet. The division of the organ which is connected with the foot-keys is called the pedal organ, and contains the largest pipes. The introduction of pedals in the organ is assigned to a German of the name of Bernhard, who flourished in the 15th century. Pedals are also used in the organ to act on the swell and on the stops. See ORGAN.

PEDALIA'CEÆ. See BIGNONIACEÆ.

PEDAL-POINT, or PEDAL HARMONY. See ORGAN-POINT.

PEDEE', GREAT, a river of North and South Carolina, rises in the Alleghany Mountains in the n.w. of North Carolina, and running s. by e. flows through the e. portion of South Carolina, and enters the Atlantic through Winyaw Bay at Georgetown. It is navigable to Cheraw, 150 m., and is about 350 m. in length.—The LITTLE PEDEE, its principal eastern branch, is formed by the confluence of several smaller rivers in the s. part of North Carolina.

PEDESTAL, a base or block on which columns, statues, etc., are frequently set. The pedestal is much used in classic architecture. Like the column, it has a base and a sort of capital or cornice, called the surbase. The shaft, or plain block is called the dado or die.

PEDETES, or HEL'AMYS, a genus of rodent quadrupeds of the family *muridæ,* allied to jerboas, but differing from them in some of the characters of their dentition.

PEDICELLAR'IÆ are very remarkable minute appendages of the integuments of many of the echinodermata, having the form of a stalk, with a small two-bladed or three-bladed forceps at its summit. They are of a fleshy substance, with calcareous granules imbedded, and in a living state the blades are continually opening and closing. They were at one time supposed to be parasitic zoophytes, but are now generally believed to be organs of the star-fish or sea-urchin.

PEDICULA'RIS, a genus of herbaceous plants of the natural order *scrophulariacæ,* some of which have rather large and finely-colored flowers. Two species, *P. palustris* and *P. sylvatica,* are natives of Britain, common in wet grounds. Both have received the name of lousewort, the English equivalent of "pedicularis," from their supposed influence in producing the lousy disease in sheep; an influence purely imaginary. Their acridity renders them injurious to sheep which eat them. Continental Europe and the northern parts of Asia produce many other species, and some are found in North America.

PEDIC'ULUS. See LOUSE.

PEDIGREE (probably from Lat. *pes,* a foot), a tabular view of the members of a particular family with the relations in which they stand to each other, accompanied or unaccompanied by a notice of the chief events in the life of each, with their dates, and the evidence of the facts stated. Pedigrees are indispensable aids to the student of history. The wars of the Roses, the claim of Edward III. to the crown of France, the relative position of Mary and lady Jane Grey, the circumstances which brought about the union of the crowns of England and Scotland, the Sleswick-Holstein question, which occupied the attention of all Europe, and many other familiar chapters in the history of nations, as well as of families, cannot be read aright without the aid of pedigrees. The materials to be used in the formation of a pedigree are notes of the facts to be set forth, and a recognized series of signs and abbreviations. These notes comprise the name of every person who is to appear in the pedigree, with such dates and circumstances as it may be considered desirable to record. Among the commonest abbreviations are *dau,* for daughter of; *s.* and *h.,* son and heir of; *coh.,* coheir of; *w.,* wife of; *s. p.* (*sine prole*), without issue; *v. p.* (*vitâ patris*), in his father's lifetime; *b.,* born, *d.,* died; *dep.,* deposed; K., king; E., earl, etc. The sign = placed between two names, indicates that they were husband and wife. All persons of the same generation are to be kept in the same horizontal line; and the main line of descent is, wherever possible, to be indicated by keeping the successive names in a vertical column. Continuous lines indicate the succession of the different generations. The members of the same family are generally arranged in their order of birth in two groups—the sons first, and then the daughters; but where the same father or mother has children by more than one marriage, the children of each marriage ought to form distinct groups.

Tabular genealogies, generally brief, and meant to illustrate some particular claim of right, are found among the records, public and private, of the early middle ages; but after the incorporation of the English heralds' college, far more attention was devoted to the compilation of pedigrees of families, more particularly with reference to their claims to dignities and heraldic insignia. In the course of the 16th c. the heralds obtained copies of all such accounts of the English families of any distinction as could be supplied to them, and entered them in the books which contain the records of their official proceedings. Royal commissions were issued under the great seal to the two provincial kings-of-arms, empowering them to visit in turn the several counties of England, in order to collect from the principal persons of each county an account of the changes which had taken place in their respective families in the interval since the last preceding visitation, and to inquire what account could be given of themselves by families who had stepped into the rank of gentry, or had become settled in the county since that period. The reg-

ister-books kept by the heralds and their assistants contain the pedigrees and arms collected in the course of the visitations, with the signatures of the heads of the families. The pedigrees thus collected contain a vast body of information, interesting not only to the professed genealogist, but to every one who would know anything of the distinguished characters in English history. Some of these books are lost, the rest are scattered among the public and private libraries of the country, the largest collections being in the archives of the college of arms and the British museum. After the beginning of last century the visitations were discontinued, and there has since been no official and regular collection of pedigrees. A standing order of the house of lords in 1767 required that before any peer should be allowed to take his seat, garter-king-of-arms was to deliver at the table of the house of lords a pedigree of his family, to be verified by the committee of privileges, and eventually preserved in the records of the house, a copy being also registered in the college of arms. This order was rescinded by lord Thurlow in 1802, with the view of framing a new one; but, unfortunately, this was never done.

PEDIGREE, in point of law, is the legal relationship between individuals which is looked to with regard to the descent of property and honors. The occasion in which it comes into question is where a person dies, in which case his property, if he died intestate, is divided among those who are related by blood. The real property goes to one set of relations, and the personal property to others. See INTESTACY, KIN, NEXT OF.

PED'IMENT, the triangular space over the portico at the ends of the roof of classic buildings. It is inclosed by the horizontal and the *raking* cornices, the latter of which follow the slopes of the roof. The pediment may be called the gable of classic buildings. It is frequently enriched with sculpture, for which it forms a fine setting. The doors and windows of classic buildings are often surmounted by pediments, either straight-sided or curved.

PEDLAR, a magisterial district in Amherst co., Va., containing the village of Pedlar Mills, which is 15 miles n.e. of Lynchburg. Pop. '90, 4993.

PEDOBAPTISM. See BAPTISM, INFANT.

PEDOM'ETER, an instrument for measuring walking distances. It sometimes has a watch or clock attached. These instruments generally measure the number of steps taken by means of the movement of a suspended weight and the user must ascertain the average length of his steps in order to interpret the reading of the instrument. See ODOMETER.

PEDRO I. (DOM PEDRO D'ALCANTARA), Emperor of Brazil, was the second son of John VI., king of Portugal, and was born at Lisbon, Oct. 12, 1798. On the death of his elder brother in 1801, he became prince of Beja, and heir to the throne; and after his father's accession to the throne of Portugal and Brazil in 1816, he received the title of prince of Brazil. He was carried along with the rest of the royal family of Portugal in their flight to Brazil in 1807, and from that time remained in that country. His education, owing to political disturbances, was not carried on systematically, and after his arrival in Brazil, he was left to instruct himself very much according to his own inclination. In 1817 he married the archduchess Leopoldine of Austria, and on his father's return to Lisbon in 1821, was named regent of Brazil. At this time a great political crisis was impending; the Brazilians had been utterly disgusted at the preferment of Portuguese to the highest offices of state and the chief clerical dignities, and their discontent was heightened by the refusal of the Portuguese cortes to accord to Brazil a liberal constitution similar to that which had been granted to the mother-country, and by its arbitrary command, that Pedro, who was at the head of the liberal party, should at once return to Portugal to complete his education. Pedro, however, cast in his lot with the Brazilians, despite threats of exclusion from the throne of Portugal, and was chosen, Oct. 12, 1822, emperor of Brazil. His government was very vigorous, but a war which broke out between his supporters and the advocates of republicanism, distracted the country for a time, and prevented the liberal measures of the government from taking full effect. In 1825 his title was recognized by the Portuguese cortes; and the death of his father, in the following year, opened for him the succession to the throne of Portugal. This revived the national spirit of the Brazilian chambers, who feared that they were about to be again reduced to a dependent state, and Pedro's hasty and passionate temper led him to measures which whetted the general discontent. But he merely retained the dignity of king of Portugal long enough to show his right to it, and, after granting a more liberal constitution, immediately resigned in favor of his daughter, Maria II. The disturbances in Brazil still increased, the finances fell into disorder, the emperor's second marriage with the princess Amelia of Leuchtenburg displeased his subjects; and after making various ineffectual attempts to restore tranquillity, he was compelled, by the revolution of July, 1831, to resign the throne in favor of his son, Pedro II., a boy of 5½ years old. Pedro then sailed for Portugal, where his brother Miguel had usurped the throne; and with the aid of an army which was swelled by French and English volunteers, after a three years' campaign, he drove away the usurper, and restored his daughter to the throne in 1834. But the ceaseless excitement by which he had been surrounded, and the excessive demands on his energies, had produced total exhaustion, and he died Sept. 24, 1834. See BRAZIL; MIGUEL, DOM; and PORTUGAL.

PEDRO II. DE ALCANTARA, João Carlos Leopold Salvator Bibiano Francisco Xavier da Paulo Leucadio Miguel Gabriel Rafael Gonzaga, Dom, Emperor of Brazil, b. Rio Janeiro, Dec. 2, 1825; ascended the throne after the revolution of 1831 had compelled his father, Dom Pedro I., to abdicate, but was not crowned emperor until July 18, 1841. He married, Sept. 4, 1843, doña Theresa Christina Maria, daughter of Francis I., king of the Two Sicilies. The line has been continued through the marriage of the emperor's daughter Isabella, to Louis, count d'Eu, son of the duc de Nemours, to whom two sons have been born. The reign of Dom Pedro was generally marked by the exercise of wisdom and good judgment. He is a man of wide culture, and in 1876 was made associate member of the French academy of sciences. The progress of Brazil has been largely due to his enlightened views. In 1867 he opened the Amazon to the commerce of all nations, and in 1871 issued a decree authorizing the gradual abolition of slavery. He made extensive tours in Europe in 1876 and 1887 (his daughter acting as regent), and in the U. S. in 1876, where he assisted Pres. Grant in opening the centennial exhibition, and spent much time in visiting the principal cities and studying the American systems of government, education, etc. On Nov. 16, 1889, he was peaceably deposed, a republic having been proclaimed; and having agreed to accept a pension and go into perpetual exile, he embarked for Lisbon, Nov. 17. He d. 1891.

PEDUNCLE. See Flower.

PEEBLES. See Peeblesshire.

PEEBLESSHIRE, a co. in the s. of Scotland, also called Tweeddale from consisting mainly of the upper valley of the Tweed, a river which originates in the county. Peeblesshire is bounded by Dumfries and Selkirk shires on the s., Lanarkshire on the w., Mid-Lothian on the n., and Selkirkshire on the east. The county is small, containing 223,000 statute acres, of which 39,000 acres are under corn crops, and 22,000 under green crops. Its lowest point above the mean level of the sea is about 450 ft., from which to 1200 ft. is the region of cultivation; but the county, being a group of hills, is mostly pastoral, with the arable lands chiefly in the valleys. The highest hill is Broadlaw, which reaches an elevation of 2,754 feet. Within the county, the Tweed has for tributaries the small rivers Eddleston, Biggar, Quair, Manor, and Lyne, besides many mountain rivulets. The only town in the county is Peebles, an ancient royal burgh, pleasantly situated on a peninsula formed at the confluence of the Eddleston with the Tweed. The principal villages are Innerleithen, Walker Burn, West Linton, and Carlops. In 1891 the population of the county was 14,800, of whom 4,704 belonged to Peebles, which, distant 22 m. from Edinburgh, is the seat of a sheriff and county administration. Besides the parish church, the town has several dissenting places of worship, including an Episcopal and a Roman Catholic chapel. It likewise possesses some good schools, has branch banks, and a number of inns. As a means of literary and social improvement, Mr. W. Chambers, in 1859, made a free gift to this his native town of a spacious suite of buildings, comprising a reading-room, a public library consisting of 15,000 volumes, a museum, gallery of art, and a hall for lectures and concerts—the whole being designated the Chambers' Institution. Long secluded from general traffic, Peeblesshire has become a favorite summer resort from the climate and the Tweed fishings. The early Scottish kings lived here when hunting in the Ettrick forest. The woolen manufacture has made considerable progress in the parish of Innerleithen. Peeblesshire abounds in the remains of British hill-forts, border towers, and other antiquities, and possesses numerous modern mansions of a handsome kind.

PEEKSKILL, a village in Westchester co., N. Y.; on the Hudson river and the New York Central and Hudson River railroad; 42 miles n. of New York. It is in a region rich in memories of the revolution, and was incorporated in 1816. There are the Field library, Helping Hand hospital, military academy, Worrill hall, St. Gabriel's school, Mohegan Lake school, House of the Good Shepherd, opera house, the New York state military camp, waterworks, gas and electric lights, manufactories of stoves, fire brick, hats, underwear, and foundry facings, national and savings banks, and several newspapers. Pop. '90, 9,676.

PEEL, a co. in s. Ontario, Canada, on the n. shore of lake Ontario; watered by the Humber river, on the Grand Trunk and the Canadian Pacific railroads; 269 sq. m.; pop. '91, 15,466. Co. seat, Brampton.

PEEL, a seaport t. on the w. coast of the Isle of Man, and a favorite health resort. It was formerly called "Holm." Its cod fisheries are productive, but those of haddock and herring have declined. Beside fishing, the building of vessels of small tonnage, and the manufacture of nets are here carried on extensively, and form a source of large profits to the inhabitants.

At the northern extremity of this bay are several grotesque and romantic caverns. The southern extremity is formed by Peel island, on which stand the grand old ruins of Peel castle described in Scott's *Peveril of the Peak*. The castle was formerly the frequent residence of the earls of Derby, then lords of the Isle of Man, and is expressly named in the original grant of Henry IV. to the Stanley family. Beneath the cathedral is a strong subterranean dungeon, where many noble persons were in former days imprisoned. Population about 3500.

PEEL, Arthur Wellesley, b. 1829; youngest son of Sir Robert; received his education at Balliol coll., Oxford, where he graduated, 1852, and subsequently read law. He ran for parliament 1863, but failed of election; in 1865 he stood, as a Liberal, for Warwick; was elected, and has been in parliament ever since. In 1880 he was appointed under-sec. of state for the home dept., and in 1884 he became speaker of the house of commons, a position which he held till 1895.

PEEL, Sir Robert, a very eminent British statesman, b. Feb. 5, 1788, near Bury, in Lancashire. His father, sir Robert Peel (created a baronet in 1800), was a wealthy cotton-spinner, from whom he inherited a great fortune. He was educated at Harrow, and at Christ-church, Oxford, where he graduated B.A. in 1808—taking a double first-class—and entered the house of commons in 1809 as member for Cashel, adopting the strong tory politics of his father. Percival was then prime-minister. Peel set quietly about the business-work of the house, feeling his way with that steady prudence and persevering diligence that were the conspicuous features of his character. In 1811 he was appointed under-secretary for the colonies; and from 1812 to 1818 he held the office of secretary for Ireland. In this capacity he displayed a strong anti-Catholic spirit (whence the witty Irish gave him the nickname of "Orange-Peel"), and was in consequence so fiercely, or, shall we say, ferociously attacked by O'Connell, that even the cool and cautious secretary was driven to send the agitator a challenge. The police, however, prevented the duel from taking place. From 1818 till 1822 Peel remained out of office, but not out of parliament, where he sat for the university of Oxford. He now began to acquire a reputation as a financier and economist; and in 1819 was appointed chairman of the bank committee, and moved the resolutions which led to the resumption of cash-payments. He was still, however, as averse as ever to anything like religious or political reform. No member of the Liverpool-Castlereagh cabinet could have been to appearance more resolute. He even vehemently defended the infamous "Peterloo massacre" of 1819. In 1822 he re-entered the ministry as home secretary—Canning shortly after becoming foreign secretary, on the suicide of lord Castlereagh. The two worked together pretty well for some time, as Peel devoted himself chiefly to financial matters, and especially to the currency; but "Roman Catholic emancipation" was a question on which Canning was considerably in advance of his brother-secretary; and when the former was called upon by the king, after the resignation of lord Liverpool, to form a sort of whig-tory ministry, Peel, along with the duke of Wellington and others, withdrew from office. Yet it is sigularly characteristic of this most honest and *compromising* statesman, that even when he seceded (1827), his opinions were veering round to the liberal and generous view of the claims of Roman Catholics; and when the death of Canning, shortly after, led to the formation of the Wellington-Peel government, its great measure—actually introduced by "Orange-Peel" himself—was the ever-memorable one for the "relief" of the Roman Catholics (1829). As home secretary, he also signalized himself by a reorganization of the London police force—since popularly called "Peelers" and "Bobbies," their previous sobriquet being "Charlies"—from king Charles I., who (1640) extended and improved the police system—and by the introduction of several other important measures.

Meanwhile, the university of Oxford had rejected its apostate representative, and chosen in his stead sir Harry Inglis. But now came on the great question of parliamentary reform, which Peel firmly but temperately opposed. In 1830 the Wellington-Peel ministry fell, and was succeeded by a whig ministry under earl Grey, which, in 1832, carried the reform bill. Peel (now, by the death of his father, sir Robert Peel), when he saw that reform was inevitable, accepted defeat and its results with great equanimity. He shrank from anything like factious opposition to the measure, and contented himself with presenting as forcibly as he could the political *per-contra*. After it was passed, he became the leader of the "conservative" opposition; and, as we have said, accepting reform itself as a *fait accompli* and irreversible, he only sought by keen and vigilant criticism of whig measures to retard the too rapid strides of liberalism. In 1833, when the first "reformed" parliament assembled, Peel took his seat as member for Tamworth, which he represented till the close of his life. On the retirement of the Melbourne ministry in Nov., 1834, he accepted the office of prime-minister, but could not succeed in giving stability to his administration, and was compelled again to give place to viscount Melbourne in April, 1835, and resumed his place as leader of the opposition. Peel's conduct in opposition was always eminently patriotic. The whigs, who were being pressed on the one side by the new radical party and the anti-corn law league, and on the other by O'Connell and the Irish repealers, gradually lost ground, and being narrowly defeated in 1841, on a motion of want of confidence, dissolved parliament. The general election that ensued was virtually a contest between free-trade and protection. Protection won; and when the new parliament met, a vote of no-confidence was carried by a majority of ninety-one. The conservative party, headed by Peel, now came into office. The great feature of the new government was the attitude it adopted on the corn-law question. The whigs, while in office, and even after their expulsion, were bent upon a fixed but moderate duty on foreign corn; the anti-corn law league would hear of nothing short of an entire repeal, while sir Robert was in favor of a modification of the sliding scale of duty which had existed since 1828. He introduced and carried (1842), in spite

of strong opposition, a measure based upon this principle. The deficit in the revenue, which had become quite alarming under the Melbourne administration, next engaged his attention, and led him to bring in a bill (1842) for the imposition of an "income-tax" of 7d. in the pound, to be levied for three years. To alleviate the new burden, Peel commenced a revision of the general tariff, and either abolished or lowered the duties on several very important articles of commerce, such as drugs, dye-woods, cattle, sheep, pigs, salted meat, butter, eggs, cheese, and lard. He also showed himself resolute in the repression of the clamorous and anarchic malcontents of Ireland. O'Connell (q.v.) was tried for conspiracy, and though the judgment against him was set aside on appeal to the house of lords, the influence of the "agitator" was broken. The first half of 1845 was marked by the allowance to Maynooth being increased and changed into a permanent endowment instead of an annual grant, and by the foundation of the Irish unsectarian colleges, and other important measures. But the potato-rot in Ireland during the autumn, followed by a frightful famine, rendered "cheap corn" a necessity, if millions were not to starve. Cobden and the league redoubled their exertions. Lord John Russell announced the views of the whig party on the crisis, and Peel again yielded. He told his ministerial colleagues that the corn-laws were doomed, and that their repeal was inevitable. Some of them refusing to go along with him, he resigned; but after a few days, was recalled, and resumed office. Lord Stanley, the late lord Derby, seceded, and with lord George Bentinck, Mr. Disraeli, etc., formed a "no-surrender" tory party; but the duke of Wellington, Graham, Aberdeen, Gladstone, and other eminent conservatives, stood by him, and the measure for the repeal was carried. He was, however, immediately afterwards defeated on an Irish protection of life bill. Not so much upon this account, as because he felt that the course which he had pursued had produced a dissolution of the old ties of party, and that he could not expect for some time to find himself at the head of a strong government, Peel retired from office in June, 1846, giving place to a whig administration under lord John Russell, to which he gave an independent but general support as the leader of a middle party rather whig than tory. In the critical times of 1847–48, he was one of the most important props of the government, whose free-trade principles he had now completely accepted. His ecclesiastical policy had also undergone a remarkable change, and he now frankly supported the whigs in the efforts to carry an act for the repeal of the Jewish disabilities. He was himself regarded by the working and middle classes generally with much grateful respect. An unexpected catastrophe put an end to his career. On June 28, 1850, he had spoken with great eloquence in the debate on lord Palmerston's Greek policy; but on the following day was thrown from his horse in Hyde Park, and was so much injured that he died on the evening of July 2.—He left five sons, the eldest of whom, Sir Robert, the second, Sir Frederick, and the fifth, Jonathan, lieut.gen. in the British army, have all held offices as ministers.

PEELE, George, 1553–98; b. England; educated at Oxford. Coming to London he wrote for the stage, and sometimes acted. He was a friend of Marlowe, Greene, and Nash; lived the life of a literary adventurer; and Meres, in his *Palladis Tamia,* ascribes his death to debauchery. Six dramas are given in Dyce's edition of his works. *The Old Wives Tale,* in its subject, closely resembles Milton's *Comus.* His non-dramatic poems are chiefly speeches for pageants, or celebrations for public occasions.

PEEL-TOWER (W. *pill,* a stake, a fortress; Lat. *pila,* a stake, pillar, structure), the name given to the towers erected on the Scottish borders for defense. They are square, with turrets at the angles, and the door is sometimes at a height from the ground. The lower story is usually vaulted, and formed a stable for horses, cattle, etc.

PEEPLES, a township in Hampton co., S. Car., containing the towns of Brunson, Hampton, and Varnville; pop. '90, 5128.

PEEPUL, Pipul, or Pippul, *Ficus religiosa,* also known as the Sacred Fig of India, and in Ceylon called the Bo Tree; a species of fig (q.v.) somewhat resembling the banyan, but the branches not rooting like those of that tree, and the leaves heart-shaped with long attenuated points. The tree is held sacred by the Hindus, because Vishnu is said to have been born under it. It is generally planted near temples, and religious devotees spend their lives under its shade. It is also held sacred by the Buddhists. It attains a great size and age. The peepul is often planted near houses, and by the sides of walks, for the sake of its grateful shade. The juice contains caoutchouc, and is used by women as bandoline. Lac insects feed upon this tree, and much lac is obtained from it. The fruit is not much larger than a grape, and although eatable, is not valued.

PEER (Fr. *pair;* Lat. *par,* equal), a general name applied to the titled nobility of Great Britain and Ireland, indicating their equality of rank. The peerage includes the various degrees of baron, viscount, earl, marquis, and duke. The peers of England, of Great Britain, of the United Kingdom, and certain representative peers of Scotland and Ireland, together with certain of the bishops and archbishops, who are called lords spiritual, constitute the house of lords. The dignity of the peerage is hereditary, but in early times was territorial. Life peerages seem at one time to have been not unknown in England: but in 1856 sir James Parke, having been created by her majesty baron

Wensleydale "for and during the term of his natural life," the house of lords, on the report of a committee of privileges, held that he was not entitled to sit and vote in parliament. Ladies may be peeresses in their own right, either by creation or by inheritance. The wives of peers are also styled peeresses. Under the articles NOBILITY, PARLIAMENT, DUKE, MARQUIS, EARL, VISCOUNT, and BARON, will be found notices of each order of peers, and of the origin, history, and privileges of the peers as a body.

A certain limited number of the French nobility were styled peers of France.

PEET, HARVEY PRINDLE, LL.D., 1794–1873; b. Conn.; graduated at Yale college in 1822, and for nine years was the assistant of Rev. Thomas H. Gallaudet in the deaf and dumb asylum at Hartford, the first institution of the kind in this country. In 1831 he became president of the New York institute for the deaf and dumb. Dr. Peet was the author of a *Course of Instruction for the Deaf and Dumb,* and wrote many papers on the same subject and on insanity.

PEEWIT. See LAPWING.

PEFFER, WILLIAM ALFRED, was born in Cumberland co., Penn., Sept. 10, 1831, and is eminently a "self-made" man. In 1850 he went to California, and made considerable money; returning, he engaged in farming near Crawfordsville, Ind. During the civil war he did gallant service in the union army. After the war he studied law, practicing first in Clarksville, Tenn., and later in Kansas. In 1881 he assumed control of the *Kansas Farmer,* with which he has been connected ever since. He was elected U. S. senator, as a populist, in 1891.

PEGAU, a t. of Saxony, on the Elster, and 14 m. s.s.w. of Leipsic. Among other buildings it contains a beautiful Gothic church, with monuments to Count Wiprecht I., and to Prince Carl of Hesse-Hamburg, who fell in 1813 at the battle of Lutzen. The cloister of Pegau was founded in 1096 by Count Wiprecht, and after the papal interdiction restored again in 1539. Besides a hospital and town hall the town has breweries, turning and grain-mills, and manufactories of shoes, tobacco, tinware, etc. Pop. '95, 5084.

PE'GANUM, a genus of plants of the natural order *zygophyllaceæ,* of which the only known species, *P. harmala,* a half-shrubby plant with linear, smooth, almost bipinnatifid leaves, and solitary, white, axillary flowers, a native of the Levant and the n. of India, is sometimes cultivated in gardens under the name of SYRIAN RUE. The seeds are narcotic, and the emperor Solyman is said to have kept himself intoxicated by eating them. They were formerly used in medicine in Europe, and still are in the east. The Turks use them as a spice, and also for dyeing red. The plant is believed to be the *harmala* of the Greeks, mentioned by Dioscorides as one of the kinds of *peganon.*

PEG'ASUS, in Greek mythology, a winged horse which arose with Chrysaor from the blood of the Gorgon Medusa, when she was slain by Perseus. He is said to have received his name because he first made his appearance beside the springs (*pēgai*) of Oceanus. He afterwards ascended to heaven, and was believed to carry the thunder and lightning of Zeus. According to later authors, however, he was the horse of Eos. The myth concerning Pegasus is interwoven with that of the victory of Bellerophon over Chimæra. Bellerophon had in vain sought to catch Pegasus for his combat with this monster, but was advised by the seer Polyidos of Corinth to sleep in the temple of Minerva, and the goddess appearing to him in his sleep, gave him a golden bridle and certain instructions, upon which he acted, and made use of Pegasus in his combat with the Chimæra, the Amazons, and the Solymi. Pegasus is also spoken of in modern times as the horse of the muses, which, however, he was not. The ancient legend on this subject is that the nine muses and the nine daughters of Pieros engaged in a competition in singing by Helicon, and everything was motionless to hear their song, save Helicon, which rose ever higher and higher in its delight, when Pegasus put a stop to this with a kick of his hoof, and from the print arose Hippocrene, the inspiring spring of the muses. But that Pegasus is the horse of the muses is entirely a modern idea, being first found in the *Orlando Innamorato* of Boiardo.

PEGASUS, a genus of fishes, constituting the family *pegasidæ,* of the order *lophobranchii* (q.v.). The species are few; they are small fishes, natives of the Indian seas, interesting from their peculiar form and appearance. The breast is greatly expanded, much broader than high, the gill-openings in the sides; the pectoral fins are extremely large and strong; a long snout projects before the eyes, and the mouth is situated under and at the base of it; the body is surrounded by three knobbed or spinous rings. One species (*P. draco*) is called the SEA DRAGON, another (*P. volans*) is popularly known as the PEGASUS.

PEGLI, a t. in the province of Genoa, Italy, situated on the gulf of Genoa, 6 m. w. of the city of Genoa; pop. 4,000. It has fine hotels and bathing-houses for the accommodation of travelers, who resort hither on account of the fine climate, and the beauty of the place.

PEGS. Small square pointed pegs of wood have of late years been introduced by the Americans in the manufacture of boots and shoes, for the purpose of connecting the

parts of the sole and upper leather together without sewing. See SHOES. This invention has been so extensively adopted, that the manufacture of wooden pegs for this purpose has become an important trade in America and Bohemia, from which countries a considerable exportation is made to Great Britain. They are chiefly made of maple wood, and are rarely more than an inch in length.

PEGU', a former province of southern Burmah, lies between the parallels of 15° 14′ and 19° 27′ n. lat., and the meridians of 94° 13′ and 96° 52′ e. long. It had, in 1872, an area of 26,987 sq. m., and a pop. of 1,662,058.

At the census of 1881, however, it had been severed into two divisions, P. and Irrawadi, with other minor readjustments. P. contained in 1891 an area of only 2,428 sq.m. and a pop. of 301,000. The new division of Irrawadi had an area of 17,542 sq. m., distributed into the districts of Thongwa, Bassein, Henzada, and Thayetmyo, and a pop. of 1,552,000.

The river Pegu rises on the east slopes of the Pegu Yoma mountains, and flows s.s.e. and s.s.w. in the Rangoon. Its lower waters are used for irrigation, and the river is navigable by large vessels as far as Pu-zondaung. Other rivers are the Irrawadi, the Rangoon, the Pegu and the Sittaung. The township of P., n.e. of Rangoon, is intersected by the Pegu river. Pegu was annexed to British India at the close of the Burman war of 1852, after which time slavery ceased to exist, schools were established, and various public works undertaken.

Rice and teak timber are the principal exports. A flotilla of steamers keeps up the communication between Rangoon (q.v.), the principal port, and the chief stations on the Irrawadi, conveying troops, stores, passengers, and mails from place to place.—Winter's *Six Months in British Burmah* (Lond. 1858); Martin's *British India* (Lond. 1862).

PEGU, or BAGOO, a t. of Burmah, situated on the Pegu river, at its junction with the Irrawadi, 44 m. n.n.e. of Rangoon. It was described by European travelers in the 16th century as a place of great strength, size, and magnificence, but in 1757, the Burmese, invading the country, took Pegu, the capital, and razed it to the ground. It was rebuilt. The population is 10,800, of whom 8,500 are Buddhist. The streets are broad, paved with brick; the houses are built of wood, and raised on posts. The town was captured by the British in 1852. P. is also the name of the northeast "township" of the Pongoon district, containing the head-quarters town of P. The northwestern portion is mountainous and forest-clad; toward the south the hills diminish and the level land is covered with rice fields. Two-thirds in value of the exports of Burmah are shipped and almost all the imports are received at this port, which is third in importance among the British Indian seaports.

PEHLEVI (valor, power; *zabán pehlavi* = language of heroes) is the name of an ancient West-Iranian (Median and Persian) idiom, in use chiefly during the period of the Sassanides (235–640 A.D.), who, wishing fully to restore the ancient Persian empire, endeavored also to reinstate the primitive national language, fallen into disuse as a court language since the time of Alexander's conquest. Yet they did not fix upon the pure Persian as it was still spoken in the interior, but upon the dialect of the western provinces, largely mixed with Semitic words, to which Aryan terminations were affixed. The grammatical structure of the Pehlevi presents almost the same poverty of inflections and terminations as the present Persian. Although, however, less rich than Zend in inflection and accentuation, it yet boasts of the same copiousness of words as that dialect, to which it in reality succeeded. It is written from right to left, and the letters are mostly joined. The remnants of Pehlevi extant consist of coins, inscriptions (found at Hajiabad, Persepolis, Kirmanshah, etc.), and a number of books, all relating to the religion of Zoroaster. The most important of these are the translation of the chief part of the Zend-Avesta (Yazna, Visparad, and Vendidâd), and such original religious works as the Bundehesh, Shikandgumâni, Dinkart, Atash Barâm, etc. The Pehlevi of the books differs from that of the inscriptions and coins to such a degree—according to the larger or smaller preponderance of the Semitic element—as to have misled investigators (Westergaard and others) to assume that two utterly distinct languages, a purely Iranic and a Semitic one, had been used somewhat indiscriminately at the time. The non-Iranian element is called Huzvaresh (Huzooresh) by the Parsee priests, who, taking advantage of the ambiguity of the Pehlevi alphabet, often substitute the corresponding Persian for the foreign words. The Iranian part of the Pehlevi differs little from the Persian of our own day, and, in fact, the Pehlevi changed first into Parsee, and subsequently into modern Persian, simply by getting rid first of its Chaldee, and then of those of its Iranian words which had become obsolete. The chief use of the Pehlevi dialect at present is the assistance it offers towards the elucidation of the Zend itself. For the history of its investigation since it was first made known in Europe, we refer to PERSIAN LANGUAGE AND LITERATURE; and AVESTA.

PEI-HO' (white river), the largest river of China north of the Yellow river, is in the province of Pechili. Rising beyond the great wall, it flows in a southeasterly direction, passes to the east of Pekin, 60 miles below which it is increased by the tributaries Hun-ho, Huto-ho, Shang-ho and the Imperial Canal. Then passing by the treaty port of Tientsin, after a very tortuous course of 80 m. it enters the gulf of Pechili near Taku forts, the latter distance being but 35 m. by land. It is navigable for boats to

Pekin, 200 m. from its mouth, which is difficult of entrance on account of a bar. Total length, 280 m.

The attack on the escort of the British and French ambassadors, whilst ascending the Pei-ho to Pekin in June, 1859, led to the war with China of 1860. See CHINESE EMPIRE.

PEINE FORTE ET DURE, the "strong and hard pain;" a species of torture formerly applied by the law of England to those who, on being arraigned for felony, refused to plead, and stood mute, or who peremptorily challenged more than 20 jurors, which was considered a contumacy equivalent to standing mute. In the beginning of the 13th c., this penalty seems to have consisted merely in a severe imprisonment with low diet, persisted in till the contumacy was overcome. But by the reign of Henry IV. it had become the practice to load the offender with weights, and thus press him to death; and till nearly the middle of the 18th c. pressing to death was the regular and lawful mode of punishing persons who stood mute on their arraignment for felony. The motive which induced an accused party, in any case, to submit to this penalty rather than to plead, was probably to escape the attainder which would have resulted from a conviction for felony. During the 15th, 16th, 17th, and even the 18th centuries, various cases are recorded of the infliction of the punishment in question. Latterly, a practice prevailed which had no sanction from the law, of first trying the effect of tying the thumbs tightly together with whipcord, that the pain might induce the offender to plead. Among instances of the infliction of the *peine forte et dure* are the following: Juliana Quick, in 1442, charged with high treason in speaking contemptuously of Henry VI., was pressed to death. Anthony Arrowsmith, in 1598, was pressed to death (Surtees's *History of Durham*, vol. iii. p. 271). Walter Calverly, of Calverly, in Yorkshire, arraigned at the York assizes in 1605, for murdering his two children and stabbing his wife, was pressed to death in the castle by a large iron weight placed on his breast (Stow's *Chronicle*). Maj. Strangways suffered death in a similar way in Newgate in 1657, for refusing to plead when charged with the murder of his brother-in-law, Mr. Fussell. In 1720 a person of the name of Phillips was pressed in Newgate for a considerable time, till he was released on his submission; and the same is recorded in the following year of one Nathaniel Hawes, who lay under a weight of 250 lbs. for 7 minutes. As late as 1741 a person is said to have been pressed to death at the Cambridge assizes, the tying of his thumbs having been first tried without effect.

The statute 12 Geo. III. c. 20 virtually abolished the *peine forte et dure*, by enacting that any person who shall stand mute when arraigned for felony or piracy shall be convicted, and have the same judgment and execution awarded against him as if he had been convicted by verdict or confession.

PEI'PUS, or CHUDSKOYE LAKE, in the n.w. of Russia, is surrounded by the government of St. Petersburg, and the provinces of Esthonia and Livonia. On the s.e. it is connected with lake Pskoff by a strait 16 m. in length and from 1½ to 4½ m. broad. The length of both lakes is 87 m., the greatest breadth about 40, and the depth from 14 to 49 feet. Lake Pskoff receives the waters of the river Velekaia, and lake Peipus is supplied by lake Pskoff, and by the Embach from the w., and other rivers. The waters of the lower lake are carried to the gulf of Finland by the Narova. The lakes are studded with several picturesque islands and are surrounded with banks which are for the most part marshy. Fishing is the chief means of support for the nearly 25,000 inhabitants of its shores.

PEIRCE, BENJAMIN, LL.D., 1809–80, b. Mass.; graduated at Harvard in 1829; tutor there in 1831; university professor of physics and mathematics, 1833; and Perkins professor of astronomy and mathematics, 1842, which position he held till his death; in 1849 consulting astronomer to the *American Ephemeris* and *Nautical Almanac;* and in 1855 one of the council to organize the Dudley observatory, Albany. In 1867 he succeeded prof. A. D. Bache as supt. of coast survey, in which service he continued till 1874. In his early life he was a contributor to the *Mathematical Miscellany*, and also published the *Cambridge Miscellany of Mathematics, Physics, and Astronomy*, in which appeared his celebrated investigation of the motion of a top spinning on a plane surface. He also prepared a series of mathematical text books for the use of the university, and it was chiefly by his exertions that the Harvard observatory was established and perfected. In the first volume of the *Proceedings of the American Academy of Arts and Sciences*, he published a paper on the discovery of Neptune, in which he demonstrated that the mass, the distance from the sun, and the conditions of the planet itself differed from the conclusions of Leverrier and Adams, and that the discovery of Neptune by Galle nearly in the place indicated by Leverrier, although that astronomer's calculations were profound, was due to accident. This paper was followed by another, discussing the relations of Neptune to Uranus. In 1851 he published in the *Astronomical Journal* remarkable papers on the constitution of Saturn's rings, in which he considered the conditions of statical equilibrium of a transverse section of a ring, and came to the conclusion that if there are separate rings, they must be more numerous than Laplace had even supposed. From these deductions others have followed by other mathematicians, particularly Prof. J. Clerk Maxwell, which have resulted in considerable changes of view in regard to the Saturnian system. See SATURN. In 1857 he gave some of the most

brilliant results in analytical mechanics, in a volume which also contained many original demonstrations. Prof. Peirce made other important contributions to mathematics and physics, which will for a long time form the basis of future investigations by others. Among these may be mentioned his researches upon the personal equation, and his investigation of the forms of an elastic sac containing a fluid, a subject which led to the theory of analytic morphology. His contributions to algebra are of the broadest and profoundest character. They are principally embraced in certain communications on linear associative algebra, to the national academy of sciences, which had been suggested by the publication by Hamilton in 1852, of his "quaternions." These communications were collected in 1870, and 100 lithograph copies were published. This book is a marvel of profundity and mathematical genius. Prof. Peirce was made an associate of the royal astronomical society of London in 1849, and of the royal society of London in 1852. He was one of the original members of the national academy of sciences, and was a member of various learned societies in Europe and America.

PEIRCE, Bradford Kinney, b. Vt., 1819; graduated at the Wesleyan university, Middletown, Conn., in 1841; was pastor in Waltham, Newburyport, and Charlestown, Mass.; and in 1844 removed to Boston to edit the *Sunday School Messenger* and *Sunday School Teacher*. In 1855–56 he was a state senator, and afterward superintendent and chaplain of the state industrial school at Lancaster, which was established by his efforts. In 1863–72 he was chaplain of the house of refuge on Randall's island, New York, when he returned to Boston, and became editor of *Zion's Herald*. He has published *Notes on the Acts; Bible Scholar's Manual; The Eminent Dead; Trials of an Inventor; The Word of God Opened; A Half-century with Juvenile Delinquents.*

PEIRCE, Charles Sanders, b. Mass., 1839; graduated from Harvard college, 1859. He delivered lectures on logic and philosophy in Boston, and at Harvard in 1869, and was the author of "The Logic of Relatives" in the *Memoirs of the American Academy of Arts and Sciences*, 1870; and of a number of articles on logic, published in the *Journal of Speculative Philosophy*, also of a *Memoir on observation of Light of the Fixed Stars*, presented to the American academy in 1875. He was engaged later in the U. S. coast survey, where he conducted experiments relative to the earth's density.

PEIRCE, James Mills, b. Mass., 1834; son of Benjamin. He was educated at Harvard, was tutor in mathematics there 1854–58 and 1860–61, and became professor of astronomy and mathematics, 1885. He has published *A Text-book of Analytical Geometry*, *Elements of Logarithms*, and other works.

PEISHWA (minister) was the title of the personage third in rank and authority at the court of the Mahratta Maharajahs of Satara, there being only the *Priti-nidhi* (delegate of Rajah), between him and his sovereign. However, during the weak reigns of Sevajee's descendants, the minister increased in importance, till, at the commencement of the 18th c., Balajee Biswanath, the then Peishwa, and a man of distinguished administrative ability and diplomatic talents, made himself virtually the ruler of the Mahrattas (q.v.).

PEISISTRATOS. See Pisistratus.

PEKAN, or Wood-shock, *Martes Canadensis*, a species of marten (q.v.), very nearly allied to the sable, a native of the northern parts of North America. It is twice the size of the pine marten, and is generally of a grayish-brown color; the legs, tail, and back of the neck marked with darker brown. The fur, although not so valuable as sable, nor even as that of the pine marten, is useful, and large quantities are sent to the market. The pekan lives in burrows, which it excavates in the banks of rivers; and feeds chiefly on fish and other aquatic animals.

PEKIN', or Pe-king' (i.e., northern capital), the capital of the Chinese empire since 1421 A.D., is situated on a sandy plain about 13 m. n.w. of the Peiho, in lat. 39° 54′ 13″ n., and long. 116° 28′ 54″ e., in the northern province of Chih-le, at a distance of nearly 100 m. from the sea, and 36 m. from the great Chinese wall. The pop. of the city is estimated at about 1,000,000; and the circuit of the walls, according to the latest measurements, is 20 miles. These walls are made of earth, with an outer casing of brick, having embrasures for musketry or ordnance every 50 feet. Those of the Tartar city have an average height of 50 feet. In thickness they vary from 60 to 40 feet. The walls of the Chinese city are only 30 feet in height, and from 15 to 25 in width. The top, to which horsemen can ascend by a ramp or sloping way, is paved with stone. At intervals of 60 yards are square towers or buttresses, projecting outward from the walls 50 or 60 feet. The gates which give access to the city from the surrounding country are 16 in number, 9 of which belong to the northern or Tartar city, and 7 to the southern or Chinese city. Over each gate is a watch-tower 160 ft. in height, and loop-holed for cannon.

The city of Pekin is divided into two parts, separated by a wall with three gates. These two sections form respectively the northern, interior, or Tartar city, called *Neitching* ("within the walls"); and the southern, exterior, or Chinese city, called *Wai-*

*tching** ("without the walls"). "Tching" or "ching," it may be remarked, means both city and wall.

1. *Nei-tching, or the interior city*, has three distinct divisions or inclosures—viz.: Kin-tching, or the prohibited city; the Hwang-tching, or imperial city; and the general city. The first of these—the innermost or central block—is surrounded by a red brick wall about 2 m. in circumference, which shuts in the palaces, pleasure-grounds, and temples of the sacred city. Here live the emperor and his family, the ladies of the court, and the attendant eunuchs. The palace proper consists of four large and two small buildings, called the Tching-kung, or "*the* palace," the Tung-kung, Si-kung, and Kin-luan-teen. The smaller buildings are allotted to the dowager-empress and suite; they are called the Ning-shou-kung, and the Keen-tsing-kung, or the "palace of earth's repose." Other notable buildings of the prohibited city are Fung-seen-teen, the "temple of imperial ancestors;" Tching-hwang-meaou, the "guardian temple of the city;" Nan-heun-teen, "the hall of portraits of the Chinese emperors and sages;" and Wan-yuen Ko, the "hall of the literary abyss," i.e., the imperial library. It also contains the offices of the cabinet, in which the members hold their sessions, the imperial treasury, the court of controllers for the regulation of the receipts and expenses of the court, etc.—The imperial city is built around this central block, and contains the palaces of the princes, temples, some of the government offices, and spacious pleasure-grounds, with beautiful artificial lakes. From Woo-ying-teen, the imperial printing-office, the *Imperial* or *Pe-king Gazette* is issued daily for all government officials throughout the empire. This is the only publication in China approaching to a newspaper, and is named *King Paou*, or "great report." It is not merely a report for official information, but forms the basis of the national annals, and is compiled from the daily records of the supreme council. Besides the daily edition, there is one published every two days, which is sold to the public, and from which is withheld decrees and reports of a secret character. The general city—the third division or inclosure—lies between the imperial city and the outside walls; it is more densely populated than either of the preceding divisions, and contains the most important of the public offices, including the six supreme tribunals or boards—the Le-fan-yuen, or the office of foreign affairs; Too-cha-yuen, or the imperial censorate, etc.; Han-lin-yuen, or the grand national college, the great medical college, the observatory, the examination hall, with—it is said—10,000 cells for the candidates who assemble to compete for public offices; and the British, French, Russian, and United States legations. One may also notice the Lama temple, founded 1725–30 to conciliate the Thibetan priesthood; the temple of Confucius, in which the emperor solemnly "worships" the great sage once a year; and the Mohammedan mosque. In 1863 a college was founded for training interpreters, but this has since become the Imperial university on the European model, with printing-presses, etc. There is also a large Roman Catholic cathedral, finished in 1888, and a Greek church and convent. The principal streets of the general city—which is the most commercial—are continuous lines of shops painted red, blue, and green; decorated with staring signs, and resplendent with Chinese characters highly gilt. By day and by night, by the light of the sun, or by the illumination of torches and paper lanterns, the roar of these great thoroughfares is incessant, — shopkeepers, peddlers, mountebanks, quack-doctors, passengers on foot or on horseback, each and all contributing to the general hubbub. The minor streets and lanes, where the houses of the populace are mingled with public offices, temples, stores, and manufactories, are by no means pleasant places, their general characteristics being an "insupportable odor," and one-storied brick houses with roofs of a gray color. There is "Fetid Hide street," "Dog's-tooth street," "Dog's-tail street," "Barbarian street," and many others with names equally uninviting.

2. *Wai-tching*, or *the southern city*, the second great division of Pekin, contains most of the mercantile population of the capital, but does not present many features of interest to the traveler. Teen-tan, or the temple to heaven, and Tee-tan, or the temple to earth, with their grounds, occupy a considerable space. The latter is considered a sort of temple of agriculture, and its grounds are the scene of the well-known ceremony in which the emperor, assisted by members of the board of rites, opens the plowing season in China at the vernal equinox. The theaters and places of public amusement are likewise situated in the southern or Chinese city; also the golden fish-ponds, and the execution-ground.

The area of Pekin being greater than the population needs, there are gardens and open spaces in many parts of the city. Outside the city there are unwalled suburbs, as about every walled town in China. These are of considerable extent, but straggling, and consist principally of an agricultural population, the land being everywhere in a state of cultivation, producing chiefly maize and millet, as it is not so suitable for the staple products of rice and wheat. The land is badly watered but well timbered, which gives a pleasing aspect to the landscape; and when viewed toward the range of mountains

* Northern city and southern city are the most correct terms. The latter was added to the more ancient northern city, and was originally designed to encircle it; hence it was called the exterior city, in contradistinction to the northern or interior city. It was also intended to reserve the northern city for the Tartars, and the southern city for the Chinese, as the names still imply; but in point of fact, the Tartar city contains as many Chinese as Tartars; and it is not surrounded by the so-called Chinese city, which latter has only been added on the south side.

extending from the w. of Pekin to the n.e., presents a picturesque panorama. About 8 m. n.w. of Pekin the famous *Yuen-ming-yuen* (lit. "round and splendid gardens") palaces are situated, which were sacked and destroyed by the allies in Oct. 1860. These were surrounded by every variety of hill and dale, woodland and lawn, interspersed with canals, pools, rivulets, and lakes, with numerous temples and pagodas containing statues of men and gods in gold, silver and bronze. Here had been heaped up for centuries all the movable riches and presents of the emperors of China. At the approach of the allies, Hien-fung fled in haste; and when lord Elgin learned that it was in those grounds that the British and French prisoners, captured by treachery, had been tortured, he gave the order to sack and destroy this favorite residence of the emperor's, "as it could not fail to be a blow to his pride as well as his feelings."

Pekin has thus been rendered memorable by this march of the British and French forces (1860) to the walls of the city, on which the British and French flags were raised. The provisions of the treaty of Tien-tsin 1858 (see CHINESE EMPIRE) were ratified and supplemented by the *Convention of Pekin*, which was signed in the English and French languages at Pekin, Oct. 24, 1860. The most important article of this convention is that which allows the residence of a British envoy at Pekin, a privilege formerly enjoyed by Russia alone. The greatest benefits have resulted to both governments by this step. The same privilege has been granted to the French and American governments. Foreigners of all nations are allowed to visit, but not to trade within the precincts of the city. Pekin has a healthy climate and there is a good water supply and no marshes in the vicinity.

Pekin is a very ancient city. Centuries before the Christian era, it was the capital of the kingdom of *Yen*, but when this kingdom was overthrown by the *Tsin* dynasty in 222 B.C., the seat of government was removed elsewhere. About 938 A.D. it again became the capital of the *Kitan* dynasty. In 1215 it was captured by Genghis Khan, and in 1264 Kublai Khan (whom readers of Coleridge will remember) fixed his residence here. The native emperors, however, who succeeded the Mongol dynasty, removed the court to Nankin, which was reckoned the chief city of the empire till Yung Lo, the third emperor of the Ming dynasty in 1421, once more made it the imperial residence, which it has ever since remained. See *Yedo and Pekin*, by Robert Fortune (Lond. 1863), *Macmillan's Magazine* (Jan. 1861), Rennie, *Pekin and the Pekingese* (1865), Jametel's *Souvenirs de l'Empire du Milieu* (1887).

PEKIN, city and co. seat of Tazewell co., Ill.; on the Illinois river and the Cleveland, Cincinnati, Chicago, and St. Louis, and several other railroads; 32 miles w. of Bloomington. It has gas and electric lights, electric street railroad, waterworks, national and private banks, Artesian Well park of 40 acres, public library, high school, manufactories of high wines and alcohol, agricultural implements, flour, brick and tile, wagons, organs, and iron and brass goods, and, in the vicinity, large veins of excellent coal. The city is in a noted corn region, is a large general grain market, and is an important shipping point by rail and water. Pop. '90, 6,347.

PELA'GIANISM, the doctrinal system of Pelagius (q.v.), especially on the subjects of the natural condition of man, original sin, grace, free-will, and redemption. Under the head PELAGIUS will be found what may be called the external history of the controversy to which the opinions of that remarkable man gave occasion. The movement, considered in itself, is one of the most interesting in the history of the human mind. At the close of the great controversies on the Trinity and Incarnation, the speculation, which for nearly a century had wearied itself in vain endeavors to make plain the inscrutable mysteries of the divine nature, at length turned inwards upon itself; and no one at all familiar with the controversy on Pelagianism can doubt that that prouder view of the capabilities of human nature, which lies at the root of all the theories of which Pelagianism was but the exponent, was a reaction against the crude and degrading conceptions of the nature and origin of the soul which characterized the philosophy, not alone of the Manichæan teachers, but of all the dualistic religions which sprung from the prolific soil of Gnosticism. To the Manichæan, and to all in general who adopted the Gnostic views as to the evil origin and nature of matter and material substances, man was, in his *psychical* nature, evil and incapable of good. The Christian teacher, in combating this view, easily passed into an opposite extreme, and overlooking or explaining away the strong language of the Scripture, was led to represent man as endowed with full capacity for all good; and so long as the only adversaries to be controverted were those who urged the views of the Gnostic school, the line taken by Christian writers was but little guarded by any of those limitations and reserves which have arisen in later controversy; and thus the earlier fathers, especially those of the eastern church, where Gnosticism was chiefly to be combated, are found to press earnestly the power for good which man possesses, without entering nicely into the origin or the motive principle of that power. But whatever of vagueness hung over this important subject was dispelled by the bold and precise statements of Pelagius, or at least by the discussion which at once arose thereupon, throughout the entire church. His teaching on the subject of original sin and on the primitive state of man has been already detailed. See ORIGINAL SIN. The earliest formal embodiment of these doctrines, for the purpose of obtaining upon them the public judgment of the church, was in a number of articles presented to the council of

Jerusalem, in 415, by Orosius. See PELAGIUS. Of these the first five regarded the doctrines already noticed under ORIGINAL SIN. The latter portion of the articles alleged that no grace or aid from God was needed for particular actions, but that free-will and the teaching of the law sufficed; that God's grace is given in proportion to our merits; that free-will would not be free, if it stood in need of aid from God; that the pardon of penitents is not granted according to God's grace and mercy, but according to their own merit and labor; and that our victory does not come from God's assistance, but from our free-will. Although the final sentence condemnatory of these doctrines (see PELAGIUS) was very generally accepted, yet the recusant party was not wanting in energy and ability. The great champions on each side were Augustine for the orthodox, and Julianus, bishop of Eclanum, for the Pelagians. Of so much of the controversy as regards original sin, the history has been already related; that on grace and free-will was more subtle, and has led to more numerous divisions on the side of orthodoxy as well as of dissent. In order to evade the condemnation of the doctrine originally ascribed to them as to grace, Pelagius and his followers declared that they did not deny the necessity of grace; but by this name they did not understand any real and internal supernatural aid given by God in each particular action, but only either some general external assistance, such as preaching, the Scriptures, good example, etc., or an aid given which might facilitate and secure the particular work, but which was by no means necessary for its accomplishment. Whether, indeed, they at any time admitted any real internal grace, is a question much disputed. Grace is of two kinds—that which moves the will, and that which enlightens the understanding. It is necessary, too, to distinguish two periods in the history of Pelagianism—one before the appearance of the *Epistola Tractoria* of pope Zosimus; the other subsequent to that decree. In the first period it would seem that the Pelagians did not admit the necessity of any internal grace whatever; in the latter they admitted the necessity of a grace of the intellect, but not of the will; or if they seemed to speak of any internal grace of the will, it was only as facilitating man's act, not as at all necessary to his doing it. The Pelagian theory, in a word, was, that man, as coming from his Creator's hand, possessed in himself, and as constituents of his own nature, all the powers which are necessary for the attainment of salvation; that by the faithful employment of these natural powers, without any further aid whatever from God, he merits eternal life, and all other rewards, by a strict title of justice; and that, to suppose grace to be necessary, is in truth to destroy the essence of free-will. This doctrine was somewhat modified in the semi-Pelagian system (q.v.). The Catholic schools, all without exception, maintain the necessity of grace for the performance, not only of all meritorious, but of all supernatural good works; and they are equally unanimous in maintaining that the grace so given, even that which is called "efficacious," does not destroy the freedom of the will. They distinguish between the "natural" and "supernatural" order, and between the powers and gifts which are proper to the one and to the other. For the attainment of all the ends of the natural order, man possesses, by his very constitution, all the powers and all the gifts which are necessary; and by the proper use of these powers, he is able to merit all the rewards which belong to the natural order. He is able, therefore, without any supernatural grace, to perform morally good works (as acts of natural benevolence, the fulfillment of the ordinary duties to his neighbor, etc.), and to fulfill the purely natural obligations. But in order to works in the supernatural order (such as the love of God above all things for his own sake, faith in him as the author of all good, etc.), and the rewards which are promised for such works, the will of man must be moved and strengthened by supernatural grace, with which the will freely co-operates, but which is a purely gratuitous gift of God—so purely gratuitous, that although God has promised eternal life as the reward of man's co-operation, yet the merit arises entirely from God's gift and promise, and not from the natural powers of the human will.

Without going into the details of the teaching of the Catholic schools, it will be enough to particularize the most remarkable among them. Of these the chief are the Molinist, which, giving most to liberty, lies nearest to the border of Pelagianism, but is clearly distinguished from it by maintaining the necessity of grace for every supernatural act; and the Thomist and Augustinian, which give most to grace, but at the same time expressly preserve the freedom of man's will. The Thomists are often represented as denying the freedom of man's actions under grace; but although it is difficult to explain, in popular language, their method of reconciling both, yet, to those acquainted with the scholastic terminology, their distinction between the infallible efficaciousness of grace, and its imposing necessity on the will, is perfectly appreciable. In this they, as well as the Augustinian school, differ from the Jansenists (see JANSEN). The Jansenists, indeed, regard the Molinist school as a plain revival of Pelagianism, and they profess that they alone represent fully, in their own system, the very same position which St. Augustine formerly maintained against that heresy in its first origin.

In the Reformed church the Arminian doctrine may be said to correspond in the main with the Molinist system in the Roman church. The Gomarists, in most, although not in all, particulars, fall in with the Jansenistic views. The Pelagian views are distinctly represented in modern controversy by the Socinians and rationalists; and indeed

very many of those who, outside of the Roman church, have at various times engaged in the predestinarian controversy on the side of free-will, have leaned towards, if they have not fully adopted, the Pelagian view. In this controversy, however, the practice, which is not uncommon in polemics, of imputing to an antagonist the extremest views of the particular side to which he leans, has been specially noticeable. The Jesuits have been stigmatized, even by their Catholic antagonists, as Pelagians; the Thomists are called by the Jesuits indiscriminately Jansenists and Calvinists, while both unite in representing Calvin and his school as in substance Manichæan.

Hardly one among the many Christian controversies has called forth a greater amount of subtlety and power, and not one has so long and so persistently maintained its vitality. Within the 25 years which followed its first appearance upwards of 30 councils (one of them the general council of Ephesus) were held for the purpose of this discussion. It lay at the bottom of all the intellectual activity of the conflicts in the mediæval philosophic schools; and there is hardly a single subject which has come into discussion under so many different forms in modern controversy. See JANSEN, ARMINIUS, GRACE, PREDESTINATION, ORIGINAL SIN, TRADUCIANISM.

PELA'GIUS, a celebrated heresiarch of the 5th c., author or systematizer of the doctrine known as Pelagianism (q.v.). Of his early life little is known. He was probably born about or before the middle of the 4th c., in Britain, or, according to some, in Bretagne, his name being supposed to be a Greek rendering (*Pelagios*, of or belonging to the sea) of the Celtic appellative *Morgan*, or sea-born. He was a monk, but the time and place of his entering that state are unknown; it is certain, however, that he never entered into holy orders. He settled in Rome, and at the end of the 4th c. he had already acquired a considerable reputation for sanctity and for knowledge of the Holy Scriptures and the spiritual life. Pelagius does not appear to have himself been a very active propagandist; but he had attached to his views a follower of great energy, and a bold and ardent temper, named Celestius, who is generally supposed to have been a Scot, which, in the vocabulary of that age, means a native of Ireland. At Rome, however, they attracted but little notice, although they began to make their doctrine public about 405; and in 410, after the sack of the city by the Goths, they withdrew to Africa. After some time Pelagius made a pilgrimage to Jerusalem, where he met St. Jerome, and for a time enjoyed the regard and confidence of that eminent but hot-tempered scholar. His opinions, however, becoming known, Jerome withdrew from this association. Celestius having remained at Carthage, and sought to be admitted to ordination, his doctrines became the subject of discussion, and in a synod several opinions ascribed to him were condemned. He appealed to Rome, but leaving Carthage without prosecuting the appeal, he passed to Ephesus; and the proceedings taken in Carthage regarding him are chiefly important as having first introduced St. Augustine into the controversy. Meanwhile Pelagius remained at Jerusalem, and news of the proceedings at Carthage having been carried to Palestine, Pelagius, in 415, was accused of heresy before the synod of Jerusalem by a Spaniard named Orosius. The impeachment failed, probably from the fact that Orosius was unable to speak Greek, the language of the synod; and in the synod subsequently held at Diospolis in the same year, Pelagius evaded condemnation by accepting the decrees of the synod of Carthage already referred to, and even obtained from the synod an acknowledgment of his orthodoxy. The west, however, was more sharp-sighted or less indulgent. A synod of Carthage, in 416, condemned Pelagius and Celestius, and wrote to Pope Innocent I., requesting his approval of the sentence, with which request Innocent complied by a letter which is still extant. On the death of Innocent, Celestius came to Rome in person, and Pelagius at the same time addressed a letter to Zosimus, the successor of Innocent; and in a council which Zosimus held, Celestius gave such explanations that the pope was led to believe that the doctrines of Pelagius had been misunderstood, and wrote to call the African bishops to Rome. A council of 214 bishops, however, was held in Carthage, in which the doctrines of Pelagius were formally condemned in nine canons, which were sent to Rome with full explanations; and on receipt of these decrees Zosimus reopened the cause, cited and condemned Celestius and Pelagius, and published a decree, called *Epistola Tractoria*, adopting the canons of the African council, and requiring that all bishops should subscribe them, under pain of deposition. Nineteen Italian bishops refused to accept these canons, and were deposed. Their leader, and the person who may be regarded as the greatest theological advocate of Pelagius in the ancient controversy, was the celebrated Julian, bishop of Eclanum, near Beneventum, who is well known to every reader of his great antagonist, St. Augustine. Pelagius himself was banished from Rome, in 418, by the emperor Honorius. From this date Pelagius disappears. Of his after life nothing is known in detail. Orosius gives an unfavorable account of his later career, but in a period of such excitement we may not accept implicitly the judgment of an adversary. The controversy, considered as an exercise of intellectual energy, is the most remarkable in the ancient history of the church. But the most important of the writings on the Pelagian side have been lost. Julian is chiefly known through the replies of Augustine. Pelagius's *Fourteen Books of a Commentary on St. Paul's Epistles*, his *Epistle to Demetrius*, and his *Memorial to Pope Innocent* have escaped destruction probably from their being included by collectors in the works of St. Jerome. They are much mutilated, but yet

almost certainly genuine. All his other works have been lost, except some further portions, chiefly fragmentary, which (with the above) have been published under the title of *Appendix Augustiniana*. After his banishment Pelagius is supposed to have returned to his native country, and to have died there. Others, however, represent him as having died in Palestine. Of his doctrines in detail an account will be found under PELAGIANISM.

PELAGO, a t. in Italy, province of Florence, 13 m. n.e. of Florence. It manufactures earthenware and woolen cloths; population less than 2,000. Vallombrosa, the richest convent in Tuscany is in this commune.

PELARGO'NIC ACID, or Nonylic Acid, $C_9H_{18}O_2$, is one of the volatile fatty acids of the general formula $C_nH_{2n}O_2$. It is an oily fluid, nearly insoluble in water, but soluble in alcohol and ether. It derives its name from its having been originally obtained from the leaves of *pelargonium roseum* (see next article) by distilling them with water. It may also be obtained by the oxidation of oleic acid or of oil of rue by nitric acid. The ethyl pelargonate, $C_2H_5 \cdot C_9H_{17}O_2$, is an oily fluid of a very peculiar smell. According to Frankland, it is to this compound that old whisky owes its peculiar flavor; and its addition to new whisky, with a view of giving it an old flavor, is not uncommon.

PELARGO'NIUM, a genus of plants of the natural order *geraniaceæ*, including many of the most favorite green-house flowers, to which the old generic name *geranium* is often popularly given. The characters which distinguish pelargonium from geranium, as now restricted by botanists, are given in the article GERANIUM. The species are numerous, and mostly s. African; Australia also producing a few. Some of them are herbaceous, and some are stemless; most of them are half-shrubby. Some have tuberous root-stocks. The leaves exhibit great variety in form, division, etc. The flowers always adhere to a certain type in form, but with great variety in size, color, etc.; they are always in stalked umbels, which arise from the axils of the leaves, or in the stemless kinds from the midst of the leaves. In no genus has the art of the gardener produced more striking results than in this; and the number of beautiful hybrids and varieties is very great, some of them excelling in beauty any of the original species. Some species, not possessing much beauty of flower, are cultivated for the grateful odor of their leaves, which in some resembles that of roses; in others, that of apples, lemons, etc.; whilst that of many species is rather unpleasant. The cultivation of pelargoniums is similar to that of other *geraniaceæ*. See GERANIUM. A few of the species endure the open air in the s. of England; many are planted out in summer even in Scotland. Water must be liberally supplied to pelargoniums during the time of flowering; but no plants more strongly require a period of rest, and water must then be very sparingly given. Many of the shrubby kinds may be taken out of the soil, hung up by the roots in a dry dark cellar, or covered with hay, and put aside in a box, in a cool dry loft or garret, care being taken, however, to protect them from frost. Every leaf should be removed before they are taken up, and young watery shoots should be cut off. Another method of treating them is to cut off every leaf before frost comes, and to keep the plants all winter in their pots in a dry cool room, without giving them a drop of water. By such means many of this beautiful genus are successfully cultivated by persons who have no green-house.

PELAS'GIANS, variously explained as denoting either "swarthy Asiatics" (*Pell-Asici*) or "storks" (*pelargoi*)—significative of wandering habits; or as being derived from the biblical *peleg* (Gen. x. 25), from the Greek *pelagos* (the sea), *pelazo* (to approach), or *pelein* and *agros* (to till the field), etc.—"a name, in fact," as Niebuhr says, "odious to the historian, who hates the spurious philology out of which the pretenses to knowledge on the subject of such extinct people arise"—designates a certain tribe or number of tribes who inhabited Italy, Thracia, Macedonia, a part of Asia Minor, and many other regions of southern Europe, in prehistoric times. Ethnologically, they belong to the same race as the great stock of the earliest known settlers, that reached from the Po and the Arno to the Rhyndakus (near Kyzikus). Yet no Pelasgian town or village existing in Greece proper after 776 B.C., speculation has, ever since the commencement of European historiography, been busy trying to supply the facts that were wanting to ascertain the exact origin and history of these predecessors of the Hellenes and Romans; and so futile have all efforts in this direction remained, that the very term Pelasgi has, from the days of Homer to our own, been used almost arbitrarily to designate either a single obscure division of a tribe like the Leleges and the Dolopes, or as an equivalent for all the Greeks of a very early period. In this latter sense, they are spoken of by Æschylus, Herodotus, Homer; while they are considered one of the branches of the race or races that peopled Greece, by Thucydides, Strabo, and most modern writers, the word thus not being a comprehensive term, like Aryan, but a narrowly circumscribed one, like Hindu. Recent investigation seems, as regards their previous history, to lead to the result, that soon after the first immigration of Turanians, they, like other tribes, left their Asiatic homes, and proceeded toward Europe. They are found at a very early period settled in Asia Minor; and Homer speaks of them as allies of the Trojans. They then seem to have spread themselves, by way of the Propontis and Ægean, and again by Crete, over many of the islands between the two continents; and finally, came to occupy a great part of the Hellenic main-land—Thessaly, Epirus, the Peloponnese, Attica, Macedonia, Arcadia,

provinces which, one and all, up to the latest period, bore distinct traces of the once undisputed sway of the Pelasgians. According to Herodotus, the Hellenes themselves sprang from them; and there can hardly be a doubt that they formed a most important element in the formation as well of that most gifted of nationalities as of the Latin people. The early Etruscans (see ETRURIA) were Pelasgians to a certain extent; and the southern tribes of the Peucetians, Œnotrians, and Iapygians are distinctly declared by ancient writers to belong to their race. The step from Greece into Italy is natural enough. What caused their wanderings originally is difficult to conjecture; but it may not unreasonably be assumed that they were caused to a certain extent by immigrations of eastern tribes, such as the Lydians, Phrygians, Carians, who pushed them further and further west, as they took possession of their old homes. A special stock was formed by the Tyrrhenian Pelasgi, whose gradual advance in Greece may be traced from Acarnania to Bœotia, thence to Attica, and later still, to the Hellespont, Lemnos, etc. A strong protest, however, must be recorded here on the part of some modern writers against the assumption of others, that the Pelasgians were in reality the original population of all Italy, as they were of the greatest part of Greece (Pelasgia). It is absurd, they argue, to suppose that a rich and populous nation, which had held a country like Italy for many centuries, should suddenly, just at the approach of historical times, die out without leaving even such single remnants as the Pelasgic settlements in Greece mentioned by Herodotus. These aboriginal Italian Pelasgians are, according to them, neither more nor less than a mere hypothesis of ignorant ancient writers, who wished to explain the ethnological and philological affinity between the two classical nations in an easy manner, and who, anticipating the questions about a contemporary colony, kill the whole nation off by pestilence and famine.

The Pelasgians, from what we can glean about them, would appear to have been a highly intellectual, receptive, active, and stirring people, of simple habits withal, chiefly intent upon agricultural pursuits. Several improvements in this province were distinctly traced back to them, such as the plowing with oxen—for which purpose they had to invent the special goad; further, the art of surveying, and the like. Yet they were no less warlike when attacked and driven to self-defense; and the trumpet, which calls the widely scattered troops to the attack, was supposed to have been first used by them. That the art of navigation was well known to them is shown sufficiently by their incessant migrations over sea and land. Of their architecture, in that style which, in default of a better name, has been called Cyclopean (q.v.), remnants are still existing. The names Larissa, Argos, Ephyra, frequently met in ancient Greece, were bestowed by them upon their fortified cities, and are only generic names, expressive of either mountain fortresses or strongholds in plains. Wishing to remain in peace, they endeavored to keep off the invader by walls so enormously strong that it really seems most surprising how they ever could have been taken. Besides these, they built canals, dams, and subterranean water-works of astounding strength and most skillful construction. The tomb or treasury of Atreus at Mycenæ was vaulted with a fine pointed "horizontal arch," 48½ ft. in diameter. Of their sculpture, which they no doubt likewise cultivated to a certain degree, we have but very small relics, such as a head of Medusa, and a *Xoanon* (divine image) of Orpheus; besides these, certain traces of their special mystic worship are to be found in archaic representations, which, though not hitherto ascribed to them, bear their direct influence upon their very face. How far they were either the inventors of the so-called Cadmean or Phenician writing-characters, from which all European characters are derived, or merely their "improvers," is not to be decided by the contradictory evidence to be found on the subject: but this, at all events, is certain, that they were acquainted with the art of writing, and had thus a vast element of culture in their possession before the dawn of history. Respecting their religion and worship, there is this only to be held with certainty, that it originally consisted in a mystic service of those natural powers, whose influence is chiefly visible in the growth of the fruits of the earth. From Egypt they obtained names for their till then nameless gods, generally called by them the Theoi; and they proceeded—by permission of the Dodonic oracle, which, together with the Pythian, they first founded—to bestow them upon them individually. Their deities were, besides the Phenician Kabiri, Demeter, Persephone Kora, Dionysos, Hermes, Zeus of Dodona, Apollo, Hephæstus, Themis, Pan, etc. Whether those Pelasgians who inhabited Lemnos and Imbros, and who were conquered by Darius, offered up human sacrifices or not, is doubtful. An ambiguous term of Herodotus respecting the language of those small Pelasgian remnants who had survived to his day, has given rise to endless and most unsatisfactory discussions. He speaks (i. 57) of their "barbarous language;" and the question is, whether he meant that it completely differed from Greek, or that there was only so vast a divergence of dialect, that it had become unintelligible to his contemporaries. Grote inclines to the former opinion; Niebuhr, Thirlwall, T. O. Müller, followed by G. Rawlinson and others, hold, with more apparent show of reason, that the term "barbarous language" merely indicates a corruption or alteration of idiom, such as a long lapse of time would infallibly produce, and that it bore the same relation to the Greek of the day as the Gothic does to the German, or the Latin to any of the Romance languages, not to instance the forlorn patois of out-of-the-

way places in Switzerland and elsewhere, supposed to be inhabited by unmixed descendants from Roman legions. That other phenomenon of the vast number of roots common both to Greek and Latin—the latter, it must be remembered, having been proved to be derived, not from the former, but from the Oscan—would thus easily be explained by the assumption of a common Pelasgian linguistic (as well as ethnical) stock in both nationalities.

Their political circumstances are as unknown to us as the whole process of transition between them and the real Greek period. From a few scattered allusions, we may conclude that they were not uniformly governed; that some of their multifarious tribes were ruled by priests, while others stood under the patriarchal rule of the head of the clan or family.

How they gradually disappeared from the rank of nations, by being either "absorbed" by superior races (Hellenes, Italici, Carians, Lydians, Phrygians), or being reduced to nameless serf-populations, does not seem so difficult to understand as some writers would have it. Hundreds of nations have disappeared in the same manner, and we may even watch the process with our own eyes. Interesting as it might be to dwell more minutely on some of the widely divergent theories and speculations upon the Pelasgians on the part of historians, philologists, ethnologists, antiquaries, and investigators generally, to whom, at all times, this people proved exceedingly attractive, we cannot enter any further upon them here, but we shall conclude with Grote's dictum: "If any man is inclined to call the unknown ante-Hellenic period of Greece by the name of Pelasgic, it is open to him to do so. But this is a name carrying with it no assured predicates, no way enlarging our insight into real history, nor enabling us to explain what would be the real historical problem—how, or from whom, the Hellenes acquired that stock of dispositions, aptitudes, arts, etc., with which they begin their career."

PELA'YO, said by historians to have been the first Christian king in Spain, after the conquest of that country by the Arabs. Contemporary historians make no mention of him, but this may be accounted for on the ground of the insignificant size of his kingdom, which comprised only the mountainous district of Asturias. He is said to have been a scion of the royal Visigothic line, and to have retired before the conquering Arabs to the mountains of Asturias, where he maintained himself against the armies which were sent to attack him, defeating them in various pitched battles, and in numberless minor engagements. One of his most famous exploits was the destruction of a large army sent against him by Tarik, near Cangas-de-Onis. His men were posted on the heights bounding the valley through which the Arabs were to pass, and, waiting till the enemy had become involved in the defile, at a given signal, overwhelmed them with enormous masses of rock. This great success caused Pelayo to be recognized as sovereign by the surrounding districts, and the Christians flocked to him from all parts of Spain. He was much engaged in contests with the Arabs, but nevertheless found time to reanimate agriculture, superintend the reconstruction of churches, and the establishment of a civil administration. He died in 737. Such is the account given us by later historians, who trace from him the genealogy of the royal family of Spain.

PELECAN'IDÆ, a family of palmiped birds, the *totipalmati* of Cuvier; characterized by a long, straight, compressed bill, broad at the base, often with a pouch beneath the lower mandible; long wings, of which the first quill is the longest; short strong legs, and all the toes—including the hind toe—united by a membrane. They are generally excellent swimmers, expert divers, and birds of powerful flight. Some of them often perch on trees, which few other web-footed birds do. To this family belong pelicans, cormorants, frigate-birds, tropic-birds, and darters.

PÉLÉE ISLAND, a large island of lake Erie in long. 82° 40′ w. is within the Canadian line, about 6 m. northward of the Put-in-bay group; and 10 m. s.w. of Point au Pélée on the n. shore mainland. It contains about 13,000 acres; is 9 m. long from n. to s., and 4 m. wide at its widest part. More than half the surface is marsh; the remainder is sparsely timbered, and of late years has been considerably occupied with vineyards. Its beaches furnish sand for building purposes.

PELEW′ ISLANDS, a group of islands in the North Pacific ocean, belonging to Spain, 450 m. e. of the Philippines, in lat. 7° to 8° n., long. 134° to 134¾° e. at the western extremity of the Caroline archipelago. The group includes 6 inhabited and a number of smaller islands (Korror, Uruktapi, Pililin, Eilmak, etc.), with a total area of 190 sq. m. The principal island is Babelthouap, area 116 sq. m., containing a mountain from whose summit a view of the whole group is obtained. As seen from the sea the islands appear mountainous and rugged; but the soil is rich and fertile, and water is abundant. Bread-fruit, cocoa-nuts, bananas, sugar-cane, lemons, oranges, and other tropical trees and fruits are grown. Cattle, fowls and goats thrive, and fish abound on the coasts. Chief exports, copra, tortoise shell, mother-of-pearl and sea-cucumbers. The climate is uniform, but hot, ranging from 77° to 91°. The inhabitants, who are estimated at about 3,000 in number, are of the Malay race. They show considerable ingenuity in building their canoes, and are active agriculturists. The islands are said to have been discovered by the Spaniards in 1545. See illus., JAVA, ETC., Vol. VIII.

PELIAS, in classical mythology son of Poseidon and of Tyro, daughter of Salmoneus. With his twin brother he was abandoned by his mother, but was found and nurtured by a herdsman, who called him P. because his face was discolored by a kick from a mare, and called his brother Neleus, because a dog had nursed him. When the brothers grew up they found their mother, who had married Cretheus, king of Iolcus in Thessaly, and on the death of the latter P. seized the throne. He despatched Jason in search of the Golden Fleece, and on the return of that hero was ignorantly put to death by his own daughters, through the instrumentality of Medea. See ARGONAUTS; MEDEA.

PELICAN, *Pelicanus*, a genus of birds of the family *Pelecanidæ* (q.v.), having a very long, large, flattened bill, the upper mandible terminated by a strong hook, which curves over the tip of the lower one; beneath the lower mandible, which is composed of two flexible bony branches meeting at the tip, a great pouch of naked skin is appended; the tongue is very short, and almost rudimentary; the face and throat are naked; the wings of moderate length, the tail rounded. The species are widely distributed, frequenting the shores of the sea, lakes, and rivers, and feeding chiefly on fish. Although birds of powerful wing, they are seldom seen at a great distance from land. All of them are birds of large size. They take their prey by hovering over the water, and plunging upon it when it appears. They often fly in large flocks, and the sudden swoop of a flock of pelicans at a shoal of fish is a striking and beautiful sight. They store up their prey in their pouch, from which they bring it out at leisure, either for their own eating, or to feed their young. The pouch is capable of being wrinkled up into small size, and of being greatly distended. The COMMON PELICAN (*P. onocrotalus*) is as large as a swan, white, slightly tinged with flesh color, and in old birds, the breast golden yellow. The quill-feathers are black, but are scarcely seen except when the wings are expanded. It is a native of the eastern parts of Europe, and of many parts of Asia and Africa, and frequents both the sea-coast and also rivers and lakes. It makes a nest of grass on the ground in some retired spot near the water, often on an island, and lays two or three white eggs. The parents are said to carry water to their young, as well as food, in their pouch. During the night, the pelican sits with its bill resting on its breast. The nail or hook which terminates the bill is red, and Mr. Broderip supposes that the ancient fable of the pelican feeding its young with blood from its own breast has originated from its habit of pressing the bill upon the breast, in order the more easily to empty the pouch, when the red tip might be mistaken for blood.—The RUFOUS-NECKED PELICAN (*P. fuscus*) abounds in the West Indies and in many parts of America.

In heraldry, the pelican is drawn with her wings indorsed, and wounding her breast with her beak. When represented in her nest feeding her young with her blood, she is called a pelican *in her piety*. See illus., BIRDS, vol. II.; LARKS, ETC., vol. VIII.

PELICAN STATE. See STATES, POPULAR NAMES OF.

PE'LION, the ancient name of a wooded mountain range in Thessaly, extending along the e. coast. Its eastern side descends in steep and rugged precipices to the sea. Further to the n., near the mouth of the Peneus, is the steep conical peak of Ossa (q.v.), which according to the classic myth, the Titans placed upon the summit of Pelion, in order to scale Olympus, the abode of the gods. The modern name is Zagorà, and, as of old, its sides and summit are clothed with venerable forests of oak, chestnut, beech, elm, and pine.

PELISSIER, AMABLE JEAN JACQUES, Marshal of France, Duc de Malakoff, b. in 1794 at Maromme, near Rouen. His father was a small farmer, little above the degree of a peasant. Pelissier was first sent to the lyceum at Brussels. At twenty he gained admission to the celebrated French artillery college of La Flèche, and was soon transferred to the special school of St. Cyr. He entered the artillery of the royal guard as sub-lieut. in 1814, and being transferred to the 57th regiment of the line, which was not called upon to do duty after the return of Napoleon from Elba, he escaped the dilemma of declaring either for or against the emperor. He served on the staff in Spain in 1823; made the campaign of the Morea in 1828; joined the first expedition to Algiers in 1830 as maj. of cavalry; and in 1839 returned to Algeria with the rank of lieut.-col. He commanded the left wing of the French army at the battle of Isly. In 1845 he acquired an unenviable notoriety by suffocating more than 500 Arabs who took refuge in the caves of Ouled-Riah in the Dahra. Marshal Soult, then minister of war, did not venture to approve this atrocity, but Marshal Bugeaud, commander-in-chief in Algeria, declared that Pelissier only carried out his positive orders. By 1850 he had attained the rank of gen. of division. When the news of the *coup d'état* reached Algiers, he espoused the cause of the emperor, and placed the province of Algiers under martial law until order was restored. In the war with Russia, he obtained in 1855 the command of the first corps of the Crimean army, and soon succeeded Marshal Canrobert in the chief command, when a change came over the fortunes of the campaign. The Russians were defeated on the Tchernaya, and on Sept. 8th, the Malakoff, the key of Sebastopol, was carried. After the fall of Sebastopol, Pelissier received a marshal's baton, and on his return to France, was created duc de Malakoff and a senator, and received a dotation of 100,000 francs. He also received the order of G.C.B. from Queen Victoria. In 1858 he came to London as the French ambassador, but resigned his post, for which he had little relish, in the following year. He was then named gov.gen. of Algiers, where he died (May, 1864) of congestion of the lungs.

PEL'LA, the ancient capital of Macedonia, and the birthplace of Philip II. and of Alexander the Great, was situated on a hill, and surrounded by marshes. It was a wealthy and powerful city, but declined under the Romans until it became a place of no consequence, and in the middle ages there remained only a strong castle called *Bodena*. Its site, 24 m. w.n.w. of Salonica, is near the modern Ala-Kilisa.

PEL'LAGRA, at one time, the name of a loathsome skin disease, supposed to be endemic to the rice-producing part of the north of Italy, is now employed to designate a group of phenomena, of which the most prominent and significant are mental. Allied affections have recently been described in various continental countries; but as presented in its most intense form in Lombardy, pellagra consists in the skin being covered with tubercles and rough scales, in debility, vertigo, inability to preserve the equilibrium, epilepsy, and great depression of spirits. The melancholia which constituted the latter stage often led to suicide, and so frequently to destruction by drowning that it was distinguished as a special form of the tendency by the appellation of hydromania. The extent of the ravages of this affection may be estimated from the facts that of 500 patients in the Milan lunatic asylum in 1827, one-third were pellagrins; that when Strambio wrote (1784), one of every twenty, and when Holland (1817), one of every five or six of the population presented symptoms of the disease. The belief, so long current, that this malady was the result of the use of rice or maize as the chief article of diet, must now be greatly modified, as it has been observed in districts and under circumstances where the food is of a different description; but where poverty, insufficient nourishment, filth, toil, and the ordinary agents in human degeneration are at work.

PELLET, or Ogress, in English heraldry, a roundle sable. See Heraldry.

PELLICANUS, Conrad, 1478–1554; b. Ruffach, Alsace; d. Zurich, Switz. His paternal name was Kürsner; the name of Pellicanus was given him by his uncle, an ecclesiastic, who sent him to the univ. of Heidelberg, 1491–92. In his 16th year he determined to become a friar, and was sent to the Minorite convent at Tübingen, 1496, where he began the study of Hebrew. He was a useful helper to Reuchlin, and published the first Hebrew grammar in a European tongue, 1503. He was ordained priest, 1501, and served his order until 1526, when he threw aside his cowl, having gradually adopted Protestant views, and became prof. of Hebrew at Zurich (1527), whence he was called by Zwingli. He was twice married, and remained at Zurich until his death. His linguistic scholarship was rare for his time. His chief work was a biblical commentary in 7 vols., Zurich, 1532–39. His Latin autobiography is one of the most interesting documents of the Reformation period.

PEL'LICO, Silvio, an Italian poet, celebrated for his long and cruel imprisonment by the Austrians, more, perhaps, than for his verses, was b. in 1789 at Saluzzo, in Piedmont, and was educated in Pignerol, where his father, Onorato Pellico, also favorably known as a lyric poet, had a silk-factory. In his 16th year he accompanied his sister Rosina (on her marriage) to Lyons, where he remained until Foscolo's *Carme de' Sepolcri* awakened in him a strong patriotic feeling and an irresistible desire to return to Italy. Coming, about 1810, to Milan, where his family were now settled, he was warmly received by Ugo Foscolo and Vincenzo Monti, and was employed as tutor in the family of count Porro, in whose house all the most distinguished men in Milan were accustomed to meet. His tragedies of *Laodamia* and *Francesca da Rimini* gained him an honorable name amongst Italian poets. He also translated the *Manfred* of Byron, with whom he had become acquainted. He lived in great intimacy with the most eminent patriots and authors of liberal views, and took an active part in a periodical called *Il Conciliatore*, which, after a time, was suppressed, on account of its liberal tone. Having become connected with the secret society of the Carbonari, then the dread of the Italian government, Pellico was apprehended in 1820, and sent to the prison of Sta. Margherita, where his friend, the poet Maroncelli, was also confined. In the beginning of the following year he was carried to Venice, and in Jan., 1822, to the prison on the isle of San Michele, near Venice; and Maroncelli and he were at last condemned to death; but the emperor commuted the sentence to 20 years' imprisonment for Maroncelli, and 15 years for Pellico. In Mar., 1822, they were both conveyed to the subterranean dungeons of the Spielberg. In Aug., 1830, however, they were set at liberty. Pellico published an account of his sufferings during his ten years' imprisonment, under the title *Le mie Prigioni* (Paris, 1833), which has been translated into other languages, and has made his name familiar where it would not have been known on account of his poetry. Pellico's health, never robust, was permanently injured. The marchioness of Barolo received him into her house at Turin as her secretary. Pellico subsequently published numerous tragedies and other poems, and a little catechism on the duties of man. His death took place Jan. 31, 1854.

PELLITORY, or Pellitory of the Wall, *Parietaria*, a genus of plants of the natural order *urticeæ*, having both unisexual and hermaphrodite flowers on the same plant, the perianth of both kinds 4-fid.

PELLITORY OF SPAIN, *Anacyclus pyrethrum*, a plant of the natural order *compositæ*, of a genus nearly allied to chamomile (q.v.), a native of the Levant and of Barbary, and cultivated to some extent in Germany and other countries. It has procumbent, branched,

downy stems; each branch one-flowered; the root-leaves pinnate, with pinnatifid segments and linear-subulate lobes. The flowers (heads of flowers) have a white ray, purplish beneath, and a yellow disk. The root is spindle-shaped and fleshy, and when dried is about the thickness of the little finger, inodorous, breaking with a resinous fracture. It has a very peculiar taste, slight at first, but becoming acidulous, saline, and acrid, with a burning and tingling sensation in the mouth and throat, which continues for some time. It is valued in medicine, and is chewed or administered in the form of a tincture to relieve toothache, also in cases of paralysis of the tongue.

PELOP'IDAS, a celebrated Theban general, of noble descent, noted among his fellow-citizens for his disinterested patriotism. The inviolable friendship between himself—one of the richest men in Thebes—and Epaminondas—one of the poorest—is among the most beautiful things recorded in Greek history. In 382 B.C. he was driven from Thebes by the oligarchic party, who were supported by the Spartans, and forced to seek refuge at Athens, whence he returned secretly with a few associates, 379 B.C., and recovered possession of the Kadmeia, or citadel, slaying the Spartan leader, Leontiades, with his own hand. Plutarch gives us a vivid picture of the adventurous exiles gliding quietly, in disguise, into the city, on a winter afternoon, amid bitter wind and sleet. Having been elected Bœotarch, in conjunction with Melon and Charon, he set about training and disciplining his troops, so that they soon became as formidable as the Lacedæmonians, and were successful in several small encounters with the latter. His "sacred band" of Theban youth largely contributed to the victory of Epaminondas at Leuctra (371 B.C.), but failed in a subsequent attack on Sparta itself. In the expedition of the Thebans against the cruel tyrant Alexander of Pheræ (368 B.C.), he was, after several important successes, treacherously taken prisoner, when in the character of an ambassador; but was rescued by Epaminondas in the expedition of the following year. He was then sent to Susa, as ambassador from Thebes, to counteract the Spartan and Athenian intrigues going on at the court of Persia, and behaved himself very nobly while there. His diplomacy was successful. In 364 B.C. a third expedition was planned against Alexander of Pheræ, who, as usual, was threatening the Thessalian towns. The command was given to Pelopidas, and in the summer he marched into Thessaly, where he won the battle of Kynoskephalæ, but was himself killed while too eagerly pursuing the foe. He was buried by the Thessalians with great pomp.

PELOPONNE'SIAN WAR. See GREECE.

PELOPONNE'SUS (i.e., the isle of Pelops), now called the Morea (q.v.), a peninsula, which formed the southern part of ancient Greece, Hellas proper being situated to the northward of the isthmus, on which stood the city of Corinth. See GREECE. The whole area is less than 9,000 sq. miles. In the most flourishing periods of Grecian history, the Peloponnesus had a population of more than two millions, although at present it has little over half a million. Among its most important cities were Sparta in Laconia, and Argos the capital of Argolis. Sparta acquired, after the Messenian war, a decided supremacy over the other states, and disputed the supremacy with Athens in a war of almost thirty years' duration (431–404 B.C.)—the famous "Peloponnesian war," of which the history has been written by Thucydides. After the Roman conquest, the Peloponnesus formed part of the province of Achaia, and subsequently belonged to the Byzantine empire. For its later history, see MOREA.

PE'LOPS, in Greek mythology, the grandson of Zeus, and the son of Tantalus, was slain by his father, and served up at an entertainment which he gave to the gods, in order to test their omniscience. They were not deceived, and would not touch the horrible food; but Ceres, being absorbed with grief for the loss of her daughter, ate part of a shoulder without observing. The gods then commanded the members to be thrown into a caldron, out of which Clotho brought the boy again alive, and the want of the shoulder was supplied by an ivory one. According to the legend most general in later times, Pelops was a Phrygian, who, being driven by Ilos from Sipylos, came with great treasures to the peninsula, which derived from him the name of Peloponnesus, married Hippodamia, obtained her father's kingdom by conquering him in a chariot-race, and became the father of Atreus, Thyestes, and other sons. But, in what appear to be the oldest traditions, he is represented as a Greek, and not as a foreigner. He was said to have revived the Olympic games, and was particularly honored at Olympia.

PELOUZE, THÉOPHILE JULES, 1807–67; b. France; completed his chemical studies under Guy Lussac, became professor of chemistry in 1830, and in 1831 associate lecturer with Lussac on chemistry in Paris at the polytechnic school, and in 1833 assayer at the mint. In 1836 he joined Liebig in Germany, and was associated with him in the discovery of œnanthic ether. On his return to Paris he was professor at the polytechnic school; in 1851 was called to fill a chair at the college of France. He is credited with the discovery of a new class of salts, the nitro-sulphates; a new and improved mode of forming copper-plate; the discovery of green cyanuret of iron; new means for simplifying the manufacture of glass; the discovery of the law of pyrogenous acids; a process for the fabrication of tannin; exhaustive analyses of the composition of beet sugar; the mode of producing fat from glycerine and an acid; the discovery of the preparation of gun-cotton; and numerous other useful discoveries.

PELTIER, JEAN CHARLES ATHANASE, 1785–1845; b. Ham, France; d. Paris. He was a watchmaker, but gave up his trade abt. 1815, to apply himself to experimental and

observational science. He made a great discovery concerning the thermal effects at junctions in a voltaic circuit, 1834, finding that the junctions in a heterogeneous circuit of metals could be heated or cooled according to the direction in which an electric current is made to pass round the circuit. He published numerous scientific papers.

PELTRY, a general term applied to the trade in skins of wild animals, and to the skins themselves. It is understood to mean only skins undressed, except by drying, and chiefly those which, when dressed, are called furs, and it is especially applied to the produce of the north-western territory (Hudson's Bay territory) of British North America, although all others are included. See FUR AND FURRIERY.

PELU'SIUM, the Greek name of an ancient Egyptian city, situated at the north-eastern angle of the Delta, and important as the key of Egypt on the Asiatic side. The eastern mouth of the Nile derived from it the epithet pelusian (*ostium pelusiacum*). Pelusium is called *sin* in the Old Testament; and both words, as well as the native Coptic or Egyptian name *peremoun*, or *peromi*, signify the mud-city. The *ostium pelusiacum* was choked up with sand as long ago as the 1st c. B.C., and its distance from the sea has ever since been increasing. Pelusium appears to have originally borne the name of Anaris, or Abaris. It is so called by Manetho, who attributes its foundation to the Hyksos about 2,000 B.C.; but it first figures in semi-authentic history as the scene of Sennacherib's defeat, when (according to the Egyptian tradition, as reported by Herodotus), the camp of the Assyrians was invaded at night by a host of field-mice, who gnawed their bow-strings and shield-straps, so that in the morning, when the Egyptians fell upon them, they were defenseless. For the Hebrew account of Sennacherib's defeat see 2 Kings, chaps. 18 and 19. In 525 B.C., Cambyses overthrew, near Pelusium, the forces of Pharaoh-Psammetichus. The city was also taken by the Persians in 309 B.C.; and in 173 B.C. it was the scene of the defeat of Ptolemy Philometor by Antiochus Epiphanes. Mark Antony captured it, 55 B.C., and it opened its gates to Octavian after his victory at Actium, 31 B.C. Its later history is unimportant.

PELVIS, THE (from the Latin *pelvis*, a basin), is a bony ring interposed between the spinal column and the lower extremities, so as to transmit the weight of the former to the latter. Before considering the pelvis as a whole, it will be expedient to consider the individual bones of which it is composed. These, in the adult, are four in number, viz., the two ossa innominata which constitute its sides and front, and the sacrum and coccyx, which complete it behind. The *os innominatum* receives its name from its bearing no resemblance to any known body, and is a large irregular-shaped bone. In the young subject, it consists of three separate bones, which meet and form the deep, cup-shaped cavity (the *acetabulum*), situated a little below the middle of the outside of the bone, and in which the head of the thigh-bone rests. Hence it is usual to describe this bone as consisting of the ilium, the ischium, and the pubes. The *ilium* is the superior, broad, and expanded portion which forms the prominence of the hip, and articulates with the sacrum. This bone may be described as divisible into an external and an internal surface, a crest, and an anterior and posterior border. The external surface (see Fig. I.) is convex in front, and concave behind; it is bounded above by the crest, below by the upper border of the acetabulum (see Fig. II.), and in front and behind by the anterior and posterior borders. It presents various curved lines and rough surfaces for the attachment of the *glutæi* and other powerful muscles connecting the pelvis and the lower extremities. The internal surface, which is smooth and concave, has the same boundaries as the external, except inferiorly, where it terminates in a prominent line, termed the *linea ilio-pectinea*. The surface of the crest is convex, roughened, and sufficiently broad to admit of the attachment of three planes of muscles. The borders will be sufficiently understood by a reference to fig. I. The *ischium* is the inferior and strongest portion of the bone. It consists of a thick and solid portion, the *body* (whose inferior border is termed the *tuberosity*), and a thin ascending portion, the *ramus*. In the ordinary sitting position, the whole weight of the body rests on the ischium; and by sitting on the hands, we can usually feel the part (the *tuberosity*, see Fig. I. 15) through which the weight is transmitted. The *pubes* is that portion which runs horizontally inward from

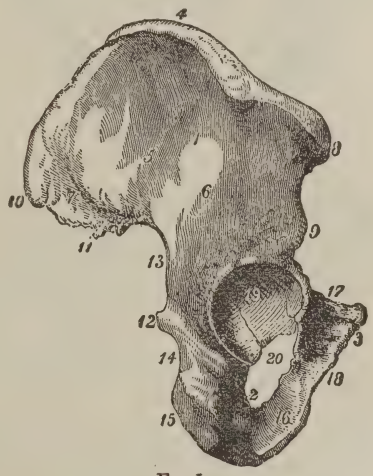

FIG. I.

The os innominatum of the right side.
1, the ilium, its external surface; 2, the ischium; 3, the os pubis; 4, the crest of the ilium, 5, 6, upper and lower curved lines for attachment of muscles; 7, the surface for attachment of the glutæus maximus; 8, 9, the anterior superior and inferior spinous processes; 10, 11, the posterior spinous processes; 12, the spine of the ischium; 13, 14, the greater and lesser sacro-ischiatic notches: 15, the tuberosity of the ischium; 16, its ramus: 17, the body of the os pubis; 18, its ramus; 19, the acetabulum; 20, the thyroid or obturator foramen.—(From Wilson.)

the inner side of the acetabulum for about 2 in., and then descends obliquely outward for about the same length, thus making an acute angle with its original direction. The former part is called the *body*, and the latter the *ramus*, of the pubes. The ramus is continuous with the ramus of the ischium. Between the ischium and the pubes is a large aperture, known as the *thyroid* or *obturator foramen*, which in the living body is closed by a membrane termed the *obturator ligament*. The object of this large foramen is probably to give lightness to the parts, without materially diminishing their strength.

The development of the os innominatum affords an excellent example of the general principles laid down in the article OSSIFICATION. There are no less than *eight* centers of ossification for this bone: three primary—one for the ilium, one for the ischium, and one for the pubes—and five secondary ones for various processes, etc. The first center appears in the lower part of the ilium, at about the same period that the development of the vertebræ commences, viz., at about the close of the second month of fœtal life; the second in the body of the ischium, just below the acetabulum, at about the third month, and the third in the body of the pubes, near the acetabulum, during the fourth or fifth month. At birth the crest of the ilium, the bottom of the acetabulum, and the rami of the ischium and pubes, are still cartilaginous. At about the sixth or seventh year, these rami become completely ossified; next, the ilium is united to the ischium; and lastly, the pubes is joined to the other two in the acetabulum. The complete ossification of the bone, from the secondary centers in the crest of the ilium, the tuberosity of the ischium, etc., is not completed till about the 25th year.

Each os innominatum articulates with its fellow of the opposite side (through the intervention of the *interosseous fibro-cartilage*, which unites the two surfaces of the pubic bones, see Fig. II. *f*), with the sacrum, and with the femur (at the acetabulum). No less than 35 muscles are attached to this bone, some proceeding to the region of the back, others forming the walls of the abdomen, others forming the floor of the pelvis, others passing downward to the lower extremities, etc. As the other bones entering into the formation of the pelvis, the sacrum, and the coccyx, belong essentially to the vertebral column, and will be described in the article on that subject, it is sufficient here to remark that, collectively, they form a triangular bony mass (with the base upward, and with a concave anterior surface), which constitutes the posterior part of the pelvic ring. See Fig. II. 4, 5.

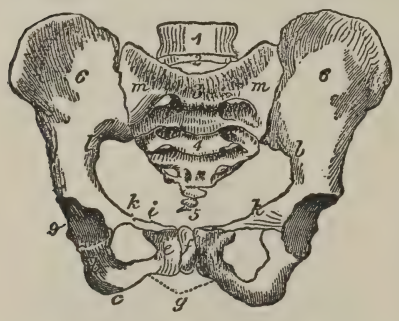

FIG. II.

Pelvis (with fifth lumbar vertebra) of European female adult. Transverse diameter, 5.7; antero-posterior diameter, 4.5 inches.
1, the last lumbar vertebra; 2, the inter-vertebral substance connecting it with the sacrum; 3, the promontory of the sacrum; 4, its anterior surface; 5, the coccyx; 6, 6, the iliac fossæ; 9, the acetabulum; *c*, the tuberosity, and *b* the body of the ischium; *e*, the os pubis; *f*, the symphysis pubis; *g*, the arch, *i*, the spine, and *k* the pectineal line of the pubis; *k*, *l*, *k*, *l*, the ileo-pectineal lines.—(From Humphry.)

The pelvis, considered as a whole, is divisible into a false and true pelvis. The *false pelvis* is all that expanded portion which is bounded laterally by the iliac bones, and lies above the prominent line termed the *linea ileo-pectinea* (see Fig. II. *k*, *l*); while the *true pelvis* is all that part of the general pelvic cavity which is situated below that linc. The broad, shallow cavity of the false pelvis serves to support the weight of the intestines; while the rectum, bladder, and part of the generative organs, lie in the cavity of the true pelvis. The upper aperture of the true pelvis is termed the *inlet*. It is somewhat heart-shaped in form, and has three principal diameters—an *antero-posterior* (or sacro-pubic), which extends from the angle formed by the sacrum with the last lumbar vertebra to the symphysis pubis, or point of union of the two pubic bones; the *transverse*, at right angles to the former, and extending across the greatest width of the pelvis; and the *oblique*, extending from the sacro-iliac symphysis (or union), on one side, to the margin of the brim corresponding with the acetabulum on the other. The diameters of the outlet are two—an *antero-posterior*, extending from the tip of the coccyx to the lower part of the symphysis pubis; and a *transverse*, from the posterior part of one ischiatic tuberosity, to the same point on the opposite side. As the precise knowledge of the diameter and depth of the pelvis is of the greatest importance in the practice of midwifery, we give the average numbers representing the dimensions of a well-formed adult female pelvis. *Diameters of inlet or brim*—antero-posterior, 4.4 in.; transverse, 5.4 in.; oblique, 4.8 inches. *Diameters of outlet*—antero-posterior, 5 in.; transverse, 4.3 inches. *Depth of the true pelvis*—posteriorly, 4.5 in.; in the middle, 3.5 in.; anteriorly, 1.5 inches.

The pelvis is placed obliquely with regard to the trunk of the body; the plane of the inlet to the true pelvis forming an angle of from 60° to 65° with the horizon. According to Naegele (*Ueber das weibliche Becken*), the extremity of the coccyx is in the female, when standing upright, about 7 lines higher than the lower edge of the symphysis pubis; the upper edge of the symphysis being at the same level as the lower edge of the second

segment of the coccyx. By attention to these data, a detached pelvis may readily be placed at the angle at which it normally lies in the skeleton. The shape of the human pelvis is much affected by the curving forward of the lower part of the sacrum. This bend of the sacrum forward serves to support the viscera, when the body is in an erect posture; but it is of much more importance in its relation to the act of parturition. If all the antero-posterior diameters of the true pelvis from the brim to the outlet were bisected, the points of bisection would form a curved line, similar to the curve of the sacrum, and termed the *axis* of the pelvis. As the head of the child has to follow this curve, the difficulties of parturition are much greater than if the axis of the pelvis had been straight, as in the other vertebrata. Without entering into unnecessary details, we may remark generally, that the fœtal head is of oval shape, with its greatest diameter from before backward, and that in its passage through the pelvis it is so placed that its longest diameter at each stage of labor coincides with the longest diameter of the pelvis. The head enters the pelvis with the occiput (or back of the skull) being directed toward one ilium, and the face toward the other, while, at its final emergence, the face is turned toward the sacrum and coccyx. There can be no doubt that the screw-like or rotatory motion which is thus given to the fetal head, renders its passage through the the pelvis more easy than it would otherwise have been.

There are well-marked differences, chiefly having reference to the act of parturition, between the male and female pelvis. In the female, the bones are lighter and more delicate than in the male, and the muscular impressions and eminences are less distinctly marked. The iliac fossæ are large and expanded, and hence the great prominence of the hips. The several diameters (particularly the transverse diameter of the brim, which measures only 5.1 in. in the male) are somewhat greater; and the pubic arch is wider by about 10 degrees; the sacrum also is wider and less curved.

It is worthy of notice that the pelvis of the negro is smaller in all its dimensions than that of the European, and presents a partial approximation to that of the monkey, especially in the deficiency of its width. This difference is very much more obvious in the male than in the female negro; and parturition in the black races is facilitated both by the sacrum being less curved, and by the fœtal head being of smaller dimensions. In the apes and monkeys, which approach most nearly to man, the pelvis is longer and narrower, and much less curved than in the human subject. In other mammals, the differences are for the most part the same in kind, but greater in degree. In many of the cheiroptera (bats) and insectivora (as the mole), the pubic bones are only loosely connected by a small ligament, or there is a complete opening between the bones (as occurs normally in birds), an arrangement by which the act of parturition in these animals is much facilitated. The pelvic bones are very simple in the cetacea, in some cases being represented by two simple elongated bones lying near the anus, and converging from opposite sides (a transverse connecting piece being sometimes but not always present); in others, by a small V-shaped bone, while sometimes (as in manatus) they seem to be entirely wanting. The additional pelvic bones in the non-placental mammals have been already noticed in the articles on the MARSUPIALIA and MONOTREMATA. In the echidna (belonging to the latter order), the acetabulum is perforated, as occurs normally in birds. In birds, in addition to the peculiarity just noticed, we find the pelvis open in front (or, more correctly, inferiorly), there being no union of the pubic bones in any bird except the ostrich. This normal incompleteness of the pelvic ring is obviously for the purpose of facilitating the passage of the eggs. It is unnecessary to trace the further degradation of the pelvic bones in the reptiles and fishes.

PEMBA, called the green isle by the Arabs, an island off the e. coast of Africa, in the British protectorate of Zanzibar, the nearest point being about 20 m. from the coast, and the southmost point 30 m. n. of the island of Zanzibar. Lat. of eastern P., 4° 54′ s., long. 39° 53′ e. Length, 35 m. from n. to s.; area, 227 sq. m. Pop. about 40,000. Next to Zanzibar, Pemba is the most remarkable island in the dominions of the sultan. It is an irregular coralline island, cut up in every direction by creeks which were formerly much frequented by country craft engaged in the slave-trade; while, owing to the numerous reefs and shoals, and to the imperfect survey of the island, they are quite impracticable for vessels of war. The vegetation is most luxuriant. Although the main island is less cultivated than Zanzibar, it appears more productive, producing good timber and plentiful supplies for shipping, especially rice, maize, sorghum, and sugar cane, but since the abolition of slavery agriculture has languished. Pemba is more unhealthy than Zanzibar, and the mortality from fever is great. Chak-Chak, the chief fort, port, and town, is situated in a deep inlet on the western side, and the narrowest part of the island. Its approach is winding and difficult. The Portuguese long made Pemba one of their principal slave depots, but this traffic has ceased since Nov., 1890, when the island came under British protection.

PEMBERTON, JOHN CLIFFORD, b. Penn., 1814; educated at West Point, and received the commission of lieut. in the artillery, 1837; served in the Seminole and Mexican wars, and for his gallantry at Monterey and Molino del Rey was brevetted capt. and major. In 1861 he resigned and joined the confederate army as a cavalry col. attached to Gen. Joseph Johnston's staff. In 1863, as lieut.-gen., he had command of the department of the Mississippi, and had charge of the defense of Vicksburg, which he surrendered on July 4, 1863. After the war he was engaged in farming in Virginia. He d. 1881.

PEM'BINA, a co. in n.e. N. Dakota, formed in 1873, bounded on the e. by the Red river of the North; drained by the Pembina river; 1120 sq. m.; pop. 1890, 14,334, chiefly of American birth. The surface is rolling, and the soil fertile. The principal productions are wheat, corn, barley, and cattle. Co. seat, Pembina.

PEM'BINA, a former co. in n.w. Minnesota, bounded on the n. by British America, on the n.e. by the Lake of the Woods, on the w. by the Red River of the North, watered by affluents of the Red and Rainy Lake rivers; about 7,000 sq. m.; pop. '80, 905. The valley of the Red river is fertile. The name was changed in 1878 to Kittston.

PEMBROKE, a seaport of south Wales, a market t., parish, and municipal and parliamentary borough, in the county of the same name, occupies a rocky ridge on a navigable creek of Milford Haven, 42 m. w. of Swansea. On the extremity of the ridge on which the town is built are the remains of its once extensive castle, said to have been the birthplace of Henry VII. Beneath the ruins is a remarkable natural cavern, which had communications both with the castle and the harbor. In 1648 the castle was beleaguered by Cromwell, and taken after a siege of six weeks. The keep, the principal building in the inner court, is 75 ft. high, and 163 ft. in circumference, and is surmounted by a cone-shaped roof of masonry, still perfect. *Pater*, otherwise called Pembroke dock, which is rather a shipbuilding than a commercial center, is 2 m. from the town, and has several building-slips and a dry dock. The naval establishment of the government embraces an area of 80 acres, and is surrounded by a high wall. Pop. mun. bor., '91, 14,978.

PEMBROKE, town and co. seat of Renfrew co., Ont., Canada; on the Ottawa river, 86 miles from Ottawa; has a large business in lumber and various manufactures. Pop. '91, 4,401.

PEMBROKE, Earl of. See Herbert.

PEMBROKE COLLEGE, Oxford. Broadgates Hall, a place of education, originally belonging in part to St. Frydeswyde's priory, and in part to the monastery of Abingdon, was, on the dissolution of the religious houses, given to Christ church by Henry VIII. In 1629 it was made a college by James I., and took its name from the earl of Pembroke, then chancellor of the university. By the ordinances of the commissioners under 17 and 18 Vict. c. 81, the constitution of the college is now as follows: There are to be not less than 10 fellowships, open to all, not to exceed £200 a year in value, so long as the number of the fellowships is less than 16. There are not to be less than 12 incorporated scholarships. There are at present 24 which are tenable for 5 years—except the Townshend scholarships, tenable for 8 years—the holders, however, sharing in the emoluments during only 4 years. This college presents to 8 benefices, of which 6 have been purchased since 1812.

PEMBROKE COLLEGE, Cambridge, was founded in 1347 by Mary de St. Paul, the widow of Aymer de Valence, earl of Pembroke. She was maid, wife, and widow, all in one day, her husband being slain at a tilting-match held in honor of her nuptials. On this sad event, she sequestered herself from all worldly delights, and bequeathed her estate to pious uses. Henry VI. was so liberal a benefactor to this college as to obtain the name of a second founder. There are 13 fellowships and 23 scholarships of different values.

PEMBROKESHIRE, a maritime co. of south Wales, and the westernmost co. of the principality, is bounded s. by the Bristol channel, and w. and n. by St. George's channel. Area, according to the census of '91, 614 sq. m. Pop. '91, 88,296. The river Teivy separates the county on the n.e. from that of Cardigan. On the n. are Newport and Fishguard bays, the latter 3 m. in width, from 30 to 70 ft. in depth, and with good anchoring-ground. St. Bride's bay, the widest inlet on the western coast, is 10 m. in width, and has an inland sweep of 7 miles. Milford Haven (q.v.) is the most important estuary. The shores on the s. are wild and inhospitable, and fronted by high precipitous cliffs. The surface is undulating; green hills alternate with fertile valleys. The principal elevations occur in the Precelly hills, which traverse the n. of the county from e. to w., and rise in their highest summit to the height of 1754 feet. The rivers of the greatest importance are the Eastern and Western Cleddau, which unite and form a navigable portion of Milford Haven. None of the rivers, of which the Western Cleddau is the principal, are important. The climate is mild, but damp in the s. of the county; while in the n., the temperature is considerably lower. There are excellent and productive soils in the s., and along the n.w. coast the barley districts are famous; but the land on the Precelly mountains and in the coal districts is inferior. Coal, slate, lead, and iron, are the only minerals worked. Oats, barley, and potatoes are the principal crops. Pembrokeshire is chiefly remarkable from the fact that, although the most distant of Welsh counties from England, more than half its surface is inhabited by an English-speaking population. This arose from the settlement of a colony of Flemings here, and their adoption of the English tongue. The district has hence been called Little England beyond Wales. Pembrokeshire returns one member to parliament. The chief towns are Haverfordwest, St. Davids, Pembroke, and Tenby.

PEM'ISCOT, a co. in s.e. Missouri, adjoining Arkansas, bounded on the e. by the Mississippi river; 480 sq.m.; pop. '90, 5975. The surface is even, with many swamps and forests. The principal productions are corn and pork. Co. seat, Gayoso.

PEMMICAN. This was originally a North American Indian preparation only, but it was introduced into the British navy victualing-yards, in order to supply the arctic expeditions with an easily preserved food, containing the largest amount of nutriment in the smallest space. As made by the Indians, it consists of the lean portions of venison dried by the sun or wind, and then pounded into a paste, and tightly pressed into cakes; sometimes a few fruits of *amelanchier ovata* are added, to improve the flavor. It will keep for a very long time uninjured. That made for the arctic voyagers was chiefly of beef. In making pemmican, it is necessary to remove the fat completely.

PEMPHIGUS, or Pom'pholyx, belongs to that order of skin-diseases which is characterized by an eruption of large vesicles, filled with serous fluid, and known as *bullæ*. The disease occurs both in the acute and in the chronic form. In a mild case of acute pemphigus, bullæ, or blisters, from the size of a pea to that of a chestnut appear in succession (chiefly on the extremities), and having continued three or four days, break, form a thin scab, and soon heal, unaccompanied with febrile or inflammatory symptoms. In severe cases, there is considerable constitutional disturbance; the bullæ are larger, and the scabs heal with difficulty. The chronic form differs mainly from the acute by its prolonged continuance. The acute variety chiefly affects children, and has been ascribed to dentition, errors of diet, etc.; while the chronic form chiefly attacks aged persons, and is probably due to debility and impaired nutrition. The acute form usually requires nothing but cooling medicines and diet, and mild local dressings, such as simple cerate, to protect the raw surfaces from exposure to the air. In the chronic form, a nutritious diet, with the judicious use of tonics (iron, bark, etc.), is most commonly successful. In obstinate cases, arsenic is sometimes of use.

PEN, an instrument for writing with a fluid. In ancient times, a kind of reed (Lat. *calamus*) was chiefly used, though sometimes the letters were painted with a fine hair-pencil, as among the Chinese at the present day. Quill pens (see Quills) probably came into use after the introduction of modern paper. The English name pen is from Lat. *penna*, a feather; but the old form of *penna* was *pesna* or *petna* (= Gr. *peteron*), from the root *pet*, to fly; and just as Lat. *ped* is identical with Eng. *foot* (see letter F), so *petna* or *peteron* corresponds to *feather* (Ger. *feder*). During last century, many efforts were made to improve the quill pen, the great defect of which was its speedy injury from use, and the consequent trouble of frequent mending; moreover, even the most skillful maker could not insure uniformity of quality, and any variation affected the writer's work. These efforts were chiefly directed to fitting small metal or even ruby points to the nib of the quill-pen; but the delicacy of fitting was so great that but very little success attended the experiments. At the beginning of this century pens began to be made wholly of metal; they consisted of a barrel of very thin steel, and were cut and slit so as to resemble the quill pen as closely as possible. They were, however, very indifferent, and being dear (the retail price at first was half-a-crown, and subsequently sixpence), they made but little way; their chief fault was hardness, which produced a disagreeable scratching of the paper. In 1820, Mr. Joseph Gillott, who dealt in the metal pens then made, hit upon an improvement, which, by removing this great defect, gave a stimulus to the manufacture, which has caused it to be developed to an extent truly marvelous. This consisted in making three slits instead of the single one formerly used, and by this means much greater softness and flexibility were acquired. Mr. Gillott also introduced machinery for the purpose of carrying out his improvements, and thereby so reduced the cost of production that he was enabled to sell his improved pens in 1821 at $36.00 per gross, which was then considered a remarkable success. Better pens are now sold at twopence per gross by the same manufacturer; or, in other words, 864 pens for the same price as one pen in 1821. Nor is this to be wondered at, when we are acquainted with the wonderful ingenuity of the machinery by which it is effected. The lowest-priced pens are made almost entirely by machinery, but the better ones require much hand labor for their completion; nevertheless, in the works of Mr. Gillott alone, who is only one of several large manufacturers in Birmingham, the annual production is now nearly 150,000,000 pens, requiring a supply of five tons per week of the fine sheet-steel made for the purpose in Sheffield, a portion of which is returned as scrap or waste for re-manufacture. From Sheffield the steel is sent in sheets about 8 ft. long by 3 ft. broad; it is prepared from the best iron, generally Swedish *bloom*. The manufacturer then prepares it by dipping for a short time in dilute sulphuric acid, which removes the *scale* or black surface; the acid itself is also carefully removed by immersion in clean water; the sheets are then passed backwards and forwards through a rolling-mill with smooth rollers, which reduces the steel to the exact thickness required, and gives it greater compactness; it is next slit into strips of various widths according to the kind of pen to be made; for the ordinary kind its width is seen in fig. 1. This is then passed through a cutting-machine, which

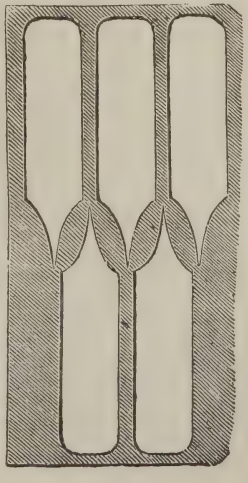

Fig 1.

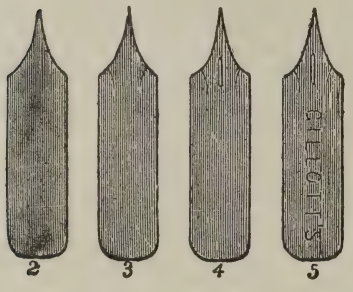
rapidly punches out pieces of the shape shown in fig. 2, and in the order shown in fig. 1, which is a portion of the strip with the pieces or blanks, as they are called, cut out; that which is represented is the waste or scrap previously referred to. The blanks are now passed through a succession of operations, each conducted by a separate person: women or girls are chiefly employed. The first process is called *slitting;* they are passed one by one into a cutting-machine worked by a small hand-lever, which makes the two side-slits, as seen in fig. 3. The second process, called *piercing,* is performed by a similar machine or hand-press, in which, however, only one punch acts, and that cuts out the small hole seen in fig. 4. The repeated rolling and stamping of the metal has by this time made it hard and brittle, and it is necessary to anneal it, for which purpose some thousands of the *slit* and *pierced* blanks are put into an iron box, and placed in the fire for a time, which softens them considerably; this is the third process. When cold, another operator receives them, and with another hand-press and a punch stamps or marks, as it is called, the name of the maker, fig. 5, which constitutes the fourth process. The fifth is somewhat similar, and is sometimes omitted; it consists in placing it under another press,



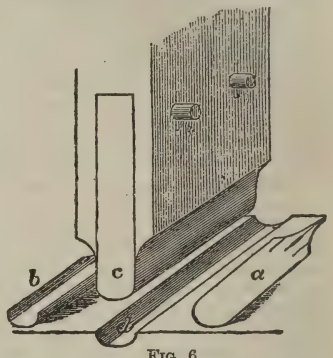


Fig. 6.

which has a punch and die for embossing any ornamental mark. The sixth process, called *raising,* consists in passing it into another press, which has a sinker and grooved die, as in fig. 6. The flat blank *a* is pushed under the sinker *c*, is pressed by the action of the lever into the groove *d*, and comes out with its edges curved up, as in *b*. The seventh process consists in *hardening,* which is done by placing the pens in an iron box or *muffle,* and when they are at a red heat, throwing them into oil; this renders them exceedingly brittle and hard, too much so, indeed, for they have now to pass through the eighth or *tempering* process, which brings them to the required temper or hardness and elasticity. The ninth operation is scouring; this consists in putting a large number into a tin cylinder, which is kept revolving by machinery; sand, and coarse emery-powder are mixed with them; and the friction of these materials and of the pens themselves cleanses them from all impurities, and brings out the natural color of the metal. The tenth and eleventh processes consist in grinding the outside of the nib, first lengthwise, and then crosswise, which are done by different persons at separate grinding-wheels. Next follows the most important operation, constituting the twelfth process or *slitting*—that is, making the central slit, upon the nicety of which the whole value of the pen depends. This is done in a hand-press similar to the others, but the cutting part consists of two chisels, one fixed on the table, the other coming down upon the depression of the lever, and so accurately adjusted as to just clear each other. The operator then skillfully holds the pen lengthwise on the fixed chisel, and brings down the moveable one, so as to effect the beautifully clean cut which constitutes so important a feature in the manufacture. Two other processes, the thirteenth and fourteenth, finish the series: the first is coloring, by heating them in a revolving cylinder over a charcoal stove, which gives them a blue or yellowish color, according to the time employed; and the last is varnishing them with a varnish composed of lac and naphtha. In the works of Messrs. Gillott, from inspection of which we have gathered these facts, there are 400 women and 100 men employed, and the daily produce is enormous: a clever girl will cut out 14,000 pens per day, and a good slitter will *slit* 28,000. Besides the kind specially described above, many other forms are made, especially the large and small barrel pens; but the processes are all the same, or are modifications of those described. Gold pens are extensively made in Birmingham, and as they resist the corrosive action of the ink, they are very durable: their durability is also greatly increased by the ingenious but difficult process of soldering on to the points of the nib minute particles of iridium, which, from their extreme hardness, resist wear for many years. The manufacture of iridium-pointed pens is extensively carried on in the city of New York, where the process is said to have been first brought to perfection. The American manufacture, however, cannot

be made very profitable, owing to the low prices of the Birmingham pens. In gold pens the American manufacture is altogether the best. Hawkins, an American residing in England, first made the iridium-pointed pens, and solved the gold pen problem; though there were not many made on this plan until 1835–40, when Mr. Levi Brown engaged in the business, at first in Detroit, Mich., and afterwards in New York. With him was associated Mr. John Rendell, who became the inventor of a number of machines and processes by which the manufacture was simplified and improved. Bagley, Spencer, Fairchild, and Morton, became celebrated for their make of gold pens. In 1890 there were in the United States 18 gold pen and pencil manufactories, employing 363 hands, producing the value of nearly half a million dollars. This product had been more than quadrupled in the ten years following the taking of the 9th census. Fountain-pens have been in the market for a number of years, but have only recently become popular, on account of improvements in the manufacture. The stylus form is employed in some of these instruments; in others, a proper pen; and they supply ink sufficient to last for steady writing at least six or seven hours. There are 15 establishments for the manufacture of fountain pens in the U. S. and 3 for the manufacture of steel pens.

PENAL SERVITUDE is a sentence for criminal offenses which has been introduced in lieu of the sentence of transportation beyond the seas. See CONVICT; TRANSPORTATION.

PENALTY is a sum of money declared by some statute or contract to be payable by one who commits an offense or breach of contract. It is considered as a kind of punishment, and constituting indirectly a motive to the party to avoid the commission of the act which induces such a consequence. Many contracts executed between parties contain a clause that one or other of them who fails to perform his part of the contract will incur a penalty, i.e., will be liable to pay a fixed sum of money to the other party. In such cases, a distinction is drawn between a liquidated and unliquidated penalty; and whether it is of the one kind or the other, depends on the language used in the contract. If it is a liquidated penalty, then, when the breach of contract is committed, the party in default must pay that precise sum, neither more nor less; but if it is unliquidated, then he is not to pay the whole sum, but merely such part of it as corresponds to the amount of injury or damage done, and of which proportion a jury is the sole judge in an action of damages. In statutes, when penalties are declared to follow on certain illegal acts, the sum is sometimes fixed, but in many cases only a maximum sum is stated, it being left to the court or the justices who enforce the penalty what is a sufficient punishment for the offense. Sometimes penalties can only be sued for by the parties immediately injured; but, as a general rule, and unless it is otherwise restricted, anybody may sue for the penalty, for in an offense against public law, where there is no public prosecutor, any person who chooses may set the law in motion. Accordingly, not only may anybody in general sue for the penalty, but an inducement is offered by declaring the party who does so to be entitled to the whole or a half of the penalty. Without such inducement, many offenses would be unpunished. The party who so sues is generally called the informer. Thus, in offenses against the game laws, anybody may sue for the penalty, and he is entitled to half of it. Sometimes the penalty can only be sued for in the superior courts of law; but in the great majority of instances the enforcing of penalties is part of the administration of justice before justices of the peace. It is for the justices to fix the amount if they have (as they generally have) a discretion to do so. If it is not paid, the justices may issue a distress-warrant, authorizing a constable to seize and sell the goods of the party to pay the fine; and if there are no goods, then the justices may commit the party to prison as a substitutionary punishment. Sometimes justices have a discretion either to impose a penalty or commit the party to prison as an alternative punishment. All these matters depend on the construction of particular statutes.

PENANCE (Lat. *pœnitentia*), in Roman Catholic theology, means the voluntary or accepted self-inflicted punishment by which a repentant sinner manifests his sorrow for sin, and seeks to atone for the sin, and to avert the punishment which, even after the guilt has been remitted, may still remain due to the offense. Penance is believed in the Roman Catholic church to be one of the sacraments of the new law. It will be necessary to explain it briefly both under its relations as a sacrament, and as a private personal exercise.

Penance must be carefully distinguished from repentance, which is simply sorrow for evil-doing, accompanied with a purpose of amendment. Penance is the fruit or the manifestation of this sorrow, and it is commonly accompanied or expressed by some of those external acts which are the natural manifestations of any deep sorrow, either negative, as the neglect of ordinary attention to dress, to the care of the person, to the use of food; or positive, as the direct acts of personal mortification and self-inflicted pain, such as fasting, wearing hair-cloth, strewing the head with ashes, watching of nights, sleeping hard, etc. Such manifestations of sorrow, whether from motives of religion or from merely natural causes, are common among the eastern races, and are frequently alluded to in the Scripture. In the personal practice of the early Christians, penance found a prominent place, and the chief and acknowledged object of the stated fasts (q.v.), and other works of mortification which prevailed, was that of penitential correction, or of the manifestation of sorrow for sin.

A still more striking use of penance, however, in the early church, was the disciplin-

ary one; and this, in the Roman Catholic view, is connected with the sacramental character of penance. Any discussion of this purely theological question would be out of place here, and it will be enough to state briefly that Roman Catholics number penance among the seven sacraments (q.v.), and believe it to be of direct divine institution (Matt. xvi. 19, xviii. 18; John xx. 21). The *matter* of this sacrament consists, in their view, of the three acts of the penitent—contrition, or heartfelt sorrow for sin, as being an offense against God; confession, or detailed accusation of one's self to a priest approved for the purpose; and satisfaction, or the acceptance and accomplishment of certain penitential works, in atonement of the sin confessed; and the *form* of the sacrament is the sentence of absolution from sin pronounced by the priest who has received the confession, and has been satisfied of the penitential disposition of the self-accusing sinner. In all these points, of course, they are at issue with Protestants. Even in the apostolic times, the practice prevailed of excluding persons of scandalous life from the spiritual fellowship of the Christian community (see EXCOMMUNICATION); and without attempting to fix the date, it may be stated as certain, from the authority of Tertullian and other writers, that from a very early time the persons so excluded were subjected to certain penitential regulations. The class of offenders so treated were those who had been notoriously guilty of the grievous crimes of idolatry or apostasy, murder, adultery, and other scandalous offenses. The period of penitential probation differed in different times and places, but in general was graduated according to the enormity of the sin, some going so far in their rigor (see NOVATIAN) as, contrary to the clearly-expressed sense of the church, to carry it even beyond the grave. In the earlier ages, much depended upon the spirit of each particular church or country; but about the 4th c. the public penitential discipline assumed a settled form, which, especially as established in the Greek church, is so curious that it deserves to be briefly described. Sinners of the classes already referred to had their names enrolled, and were (in some churches, after having made a preliminary confession to a priest appointed for the purpose) admitted, with a blessing and other ceremonial, by the bishop to the rank of penitents. This enrollment appears to have commonly taken place on the first day of Lent. The penitents so enrolled were arranged in four grades, called—1. (Gr. *proskIaiontes*, Lat. *flentes*) "Weepers;" 2. (Gr. *akroōmenoi*, Lat. *audientes*) "Hearers;" 3. (Gr. *hypopiptontes*, Lat. *prosternentes*) "Prostrators;" 4. (Gr. *systantes*, Lat. *consistentes*) "Standers." Of these classes, the first were obliged to remain outside of the church at the time of public worship, and to ask the prayers of the faithful as they entered. The second were permitted to enter and to remain in the place and during the time appointed for the catechumens (q.v.); but, like them, were required to depart before the commencement of the solemn part of the liturgy (q.v.). The third were permitted to pray with the rest, but kneeling or prostrate, and for them were prescribed many other acts of mortification. The fourth were permitted to pray with the rest in a standing posture, although apparently in a distinct part of the church; but they were excluded from making offerings with the rest, and still more from receiving the communion. The time to be spent in each of these grades at first differed very much according to times and circumstances, but was afterwards regulated by elaborate laws, called penitential canons. Still it was in the power of the bishop to abridge or to prolong it, a power, the exercise of which is connected with the historical origin of the practice of indulgence (q.v.). Of these four grades, the first two hardly appear in the western church. It is a subject of controversy whether, and how far, this discipline was extended to other than *public* sinners; but it seems certain that individuals, not publicly known as sinners, *voluntarily* enrolled themselves among the penitents. All four grades wore a distinguishing penitential dress, in which they appeared on all occasions of public worship, and were obliged to observe certain rules of life, to renounce certain indulgences and luxuries, and to practice certain austerities. In some churches they were employed in the care of the sick, the burial of the dead, and other of the more laborious works of charity. The penitent, in ordinary cases, could only be restored to communion by the bishop who had excluded him, and this only at the expiration of the appointed time, unless the bishop himself had shortened it; but, in case of dangerous illness, he might be restored, with the condition, however, that, if he recovered from the illness, the whole course of penance should be completed. The reconciliation of penitents took place commonly in Holy Week, and was publicly performed by the bishop in the church, with prayer and imposition of hands. It was followed by the administration of communion. If any of the clergy were guilty of a crime to which public penance was annexed, they were first deposed from the rank of the clergy, and then subjected to the ordeal, like the laity themselves. This public discipline continued in force with greater or less exactness in the 5th, 6th, and 7th centuries, gradually, however, being replaced by semi-public, and ultimately by private penance. In the 11th and 12th centuries the public penance had entirely disappeared. The nature and origin of *private penance* is a subject of controversy between Catholics and Protestants; the former contending that it had existed from the first, and that it held the same place even in the ages of public penance for *secret sins* which the public penance did for public offenses. At all events, from the date of the cessation of the public discipline, it has existed universally in the Roman church. The priest, in absolving the penitent, imposes upon him the obligation of reciting certain prayers, undergoing certain works of mortification, or performing certain devotional exercises. These acts of the penitent are held to form an integral part of the sacrament of penance.

According to Protestants, penance has no countenance whatever from Scripture, and is contrary to some of the most essential principles of the Christian religion; particularly to the doctrine of justification by faith in Jesus Christ alone, on the ground of his complete or "finished" work; penance being, in fact, founded on a doctrine of—at least—supplementary atonement by the works or sufferings of man—the sinner—himself. The outward expressions of humiliation, sorrow, and repentance common under the Jewish dispensation, are regarded as very consistent with the character of that dispensation, in which so many symbols were employed. It is also held that the self-inflicted austerities, as fasting, sackcloth and ashes, etc., of Jewish and earliest Christian times, had for their sole purpose the *mortification* of unholy lusts and sinful passions in the people of God; or the expression of sorrow for sin, so that others beholding might be warned of its evil and restrained from it; all which is perfectly consistent with the principles of Christianity, if kept within the bounds of moderation and discretion. But penance in any other view, as a *personal exercise*, is utterly rejected. Arguments founded on the meaning of the two Greek words *metanoeō* and *metameleomai*, both translated in our English version *repent*, are much urged by many Roman Catholic controversialists—the former being represented as equivalent to the English *do penance;* but this is condemned by Protestants as inconsistent with the very use of the words in the New Testament itself. That penance began, as a practice, very early in the Christian church, is not only admitted by Protestants, but alleged in proof of the very early growth of those corruptions which finally developed themselves in the doctrines and practices of the Roman Catholic church, and of which Protestants also hold that there are plain intimations in the New Testament, not only prophetical, but showing the development of their germs to have already begun during the age of the apostles.

In the discipline of the Protestant churches, penance is now unknown. The nearest approach to the Roman Catholic polity on the subject was that in use among the English Puritans of the 17 c., and more particularly in the church of Scotland during that and the succeeding century, when it was common "to make satisfaction publicly on the stool of repentance" (q.v.). It does not seem to have occurred to the Reformers, or their more immediate successors in the Protestant churches, that their sytem of discipline, with its public rebukes and enforced humiliations of various kinds—as the wearing of a sackcloth robe, and sitting on a particular seat in church—was liable to be interpreted in a sense very different from that of a mere expression of sorrow for sin; but the belief is now very general among the most zealous adherents of their doctrinal opinions, that in all this they adopted practices incongruous with their creed, and in harmony rather with that of the church of Rome. Nor do they seem to have perceived that church discipline (q.v.), in its proper sense, as relating to ecclesiastical rights and privileges, is wholly distinct from the imposition of penalties by churches or church courts. Penitential humiliations, imposed by ecclesiastical authority, are now no more in favor where church discipline is most strict than where the utmost laxity prevails.

PENANG. See PRINCE OF WALES ISLAND.

PENARTH, a seaport of Glamorganshire, Wales, at the mouth of the Taff, opposite Cardiff. It was an unimportant village until 1856, when it was made a tidal harbor. Docks were built upon an extensive scale, and P. is now an important shipping port for the minerals of South Wales, especially coal, iron, and alabaster. The dock yields 6125 ft. of quayage and the tidal harbor 15,000 ft. The custom-house and dock offices are the principal buildings. Pop. '91, 12,422.

PENATES. See LARES, MANES, and PENATES.

PENCILS are instruments for writing, drawing, and painting, and they differ as much in their construction as in the uses to which they are applied. Probably the pencil was the first instrument used by artists, and consisted then of lumps of colored earth or chalk simply cut into a form convenient for holding in the hand. With such pencils were executed the line-drawings of Aridices the Corinthian, and Telephanes the Sicyonian, and also the early one-colored pictures, or *monochromata*, of the Greeks and Egyptians; but as wet colors began to be used, small fine-pointed brushes would be required, and we find it recorded that as early as the 4th c. B.C., several Greek artists had rendered the art of painting with hair-pencils so famous, that some of their pictures sold for vast sums of money. There are now in use the following kinds of pencils: hair-pencils, black-lead pencils, chalk-pencils, and slate-pencils. The first are used for painting or writing with fluid colors, either oil or water, and in China and Japan are employed almost entirely instead of pens for writing; the color used being the black or brown pigment obtained from various species of sepia or cuttle-fish. The manufacture of hair-pencils is of great importance, and requires much care and skill. The hairs employed are chiefly those of the camel, badger, sable, mink, kolinski, fitch, goat, and the bristles of hogs; and the art of pencil-making requires that these hairs shall be tied up in cylindrical bundles, so nicely arranged that all their naturally fine points shall be in one direction, and that the central one shall project the furthest, and the others in succession shall recede, so that, collectively, the whole shall form a beautifully smooth cone, the apex of which is a sharp point. Black-lead pencils are made of graphite or plumbago, which contains no lead whatever in its composition, but is in reality almost pure carbon. See BLACK-LEAD. The misnomer is probably owing to the fact that, previous to the employment of graphite for making pencils, common lead was used, and this was the case even within the present century

Consequently, as the plumbago, with its black streak, offered a contrast to the pale one of the lead, it was called in contradistinction *black-lead*.

The best graphite for drawing-pencils is found in the Cumberland mines, which have long been celebrated. Within the last twenty years, however, vast deposits of this mineral, of a very fine quality, have been discovered in Siberia and other parts of the Russian empire. Inferior qualities are found in Austria and Prussia, in Ceylon, and various parts of North America; but they are rarely used in pencil-making, except for very inferior kinds. Black-lead is rarely sufficiently free from sand and other foreign ingredients to be used without preparation; it is therefore generally ground fine, and levigated or washed until it is pure, and again formed into solid blocks by means of enormous pressure, generally in hydraulic presses; these blocks are then sawn into thin plates about the sixteenth of an inch in thickness, which are again cut across, so as to form them into small square sticks.

It may appear a very simple process to press the powdered graphite into blocks, but it was found so difficult in practice as almost to prevent the employment of this method, which has led to immense improvement in pencil-making. It was found at first that the difficulty of pressing out the contained air was so great that the presses were broken under the weight required; pressure in a vacuum was then tried, but the difficulty of applying it was found almost insurmountable, and it was certainly unprofitable. Mr. Brokedon of London, who has long been famous for his pencils, at last surmounted the difficulty by an ingenious and very simple process. This consists in compressing the black-lead into blocks 2 or 3 in. square, with only moderate pressure; these are then coated over with paper, well glued, so that when dry the covering is air-tight. A small hole is now made through this coating on one side, and several of these cubes of black-lead are put under the receiver of an air-pump, and the air being exhausted completely from them the orifice in each is closed by an adhesive wafer, which prevents the return of the air when they are taken out of the receiver. They are next placed under the hydraulic press, and a well-sustained and regular pressure is brought to bear upon them for 24 hours, after which they are found to be so completely consolidated, that in cutting them the substance is equal in density to the best specimens of unprepared graphite. There is so large a variation in the color of various qualities of black lead that by a judicious mixture of them, when in the powdered state, almost any shade of darkness can be procured; but instead of thus carefully combining different qualities of graphite it is a common practice to add sulphur or sulphuret of antimony, and by heating to procure the desired degree of blackness. For very inferior pencils the worst quality of black lead is mixed with black chalk and size, or gum-water, and formed into a paste, of which the pencil is made.

It is usual to inclose the material constituting the essential part of the pencil in a case of wood, for its protection from breakage, and to prevent its soiling the hands. The wood (generally cedar) is first sawn into thin boards, about half the thickness of the intended pencils; these are then cut into small pieces about 10 in. long by 6 in width, which are placed in the cutting and grooving machine. This machine consists principally of two circular saws—one very thin and so set that it will cut through the board; the other revolving within the eighth of an in. of it, so set as only to cut a fine square groove in the wood. By means of this machine the little boards are cut into straight square sticks, each having a groove on one surface. Into these grooves the little prepared sticks of black-lead are laid and covered with a similar piece of wood, but not grooved. A workman, who is called the "fastener-up," having glued the inner faces of the two pieces of wood, presses them together and sets them to dry; after which they are passed through the rounding-machine, dressed with a semicircular smoothing-plane, cut at the ends, and then polished by rubbing them with a piece of shark-skin. The last process is stamping them with the maker's name and the letter which designates their peculiar quality. Pencils have been recently made with covers of paper. The lead is surrounded by spiral strips of paper which are rolled on to the thickness of the usual wood-covered pencil. Pulling off the strip nearest the pencil point has the effect of sharpening the pencil.

Chalk-pencils are made in a similar manner, only that finely-powdered colored chalks, such as are used for crayons are substituted for the black-lead. Previous to pressing and cutting the chalk, it is mixed with a little hot melted wax, which gives it softness and adhesiveness.

Slate-pencils for writing on slate are made either by cutting slate into thin sticks and rounding them, or by cutting it into fine square slips, and encasing them in wood, as in the case of black-lead, etc.

PENDANT, or PENNANT, is a narrow flag of great length, tapering to a point, and carried at the head of the principal mast in a royal ship, to show that she is in commission. In the British navy the pendants are borne of three colors—red, white, or blue—according to the color to which the admiral commanding the fleet pertains. See FLAG-OFFICER. A *broad-pennant* is a blue pennant, shorter and broader than the above, carried at the mast-head of a commodore's ship, to denote that her captain is the commodore on the station. A first-class commodore hoists his broad-pennant at the fore; if of the second-class his flag flies at the mizzen.

The *rudder-pendants* are strong ropes spliced in the rings of the rudder-chain, to prevent the loss of the rudder should it by any accident become unshipped.

PENDANT, a hanging ornament, used in ceilings, vaults, staircases, timber-roofs, etc. It is sometimes a simple ball, and sometimes elaborately ornamented, and is chiefly used in the later Gothic and Elizabethan styles.

PENDEN'TIVE, the portion of a vault resting on one pier, and extending from the springing to the apex.—The word pendentive is also applied to the portions of vaults introduced in the angles of rectangular compartments, in order to reduce them to a circular or other suitable form to receive a dome.

PENDER, a co. in e. part of N. Car.; formed, 1875, from part of Hanover co., traversed by North-east Cape Fear river, and crossed by the Atlantic Coast line railroad. The surface is level, with few pine forests; soil sandy. Productions, Indian corn and cotton. Pop. '90, 12,514, includ. colored. Area, 800 sq. m. Co. seat, Burgaw.

PENDLETON, a co. in n. Kentucky, bounded on the n.e. by the Ohio river, drained also by the Licking river and many creeks; traversed by the Louisville and Nashville railroad; 310 sq. m.; pop. '90, 16,346, chiefly of American birth, with colored. The surface is rolling and the soil yields in large quantities corn, wheat, and tobacco. Lumber, cattle, and pork also are staples. Blue limestone is found. Co. seat, Falmouth.

PENDLETON, a co. in e. West Virginia, bordering on Virginia on the e. and s.w.; drained by the s. branch of the Potomac and its tributaries; between the Alleghany and Shenandoah ranges and crossed by several ridges of mountains; 650 sq. m.; pop. '90, 8711, chiefly of American birth, with colored. The surface is heavily wooded with oak, sugar maple, hickory, etc. Corn, wheat, hay, and pork are the staples. Cattle raising is extensively carried on. Co. seat, Franklin.

PENDLETON, a township of Lancashire, England, with a station on the Lancashire and Yorkshire railway, is a suburb of Manchester, and is 2½ m. n.w. of the town of that name. In 1891 the population numbered 23,866, a marked increase in thirty years. Pendleton is part of the parliamentary borough of Salford, and since 1852 it has been incorporated with the municipality of the same borough. The rapid increase of its population is due to the immense industry of the locality. The inhabitants are employed in the numerous cotton and flax mills, print and dye-works, iron foundries, soap, and chemical works, in operation here.

PENDLETON, Edmund, 1721–1803, b. Richmond, Va.; his education was self-acquired, and in 1742 he was admitted to the state bar. He was elected to the "house of burgesses" in 1752; was a member for many years and speaker when the contest between the king and colonies began. He was a delegate to the colonial congress, 1774, 1775, and presiding officer of the Virginia conventions of 1775 and 1776. The resolution instructing the state delegates to introduce in congress resolutions of independence was written by Pendleton. In the early part of the war he was president of the state committee of safety. In 1778 he was appointed chief judge of the chancery court and in 1779 of the court of appeals, which position he held for many years. In 1788 he presided over the convention which adopted the U. S. constitution, and was praised by Jefferson as the ablest man whom he had ever met in debate. Pendleton was generally regarded as the rival of Patrick Henry.

PENDLETON, George Hunt, b. Cincinnati, 1825; studied law, was admitted to the bar in Ohio, and became distinguished in his profession. He entered upon a political career on being elected to the senate of his native state in 1854 and 1855. In 1856 he was elected representative in congress, and served successively in the 35th, 36th, and 37th congresses, being a member of the house committee on military affairs during each term. In the 38th congress, to which he was also elected, he served on the committee of ways and means. He identified himself with the anti-war democrats, and attracted much public criticism on account of the boldness of his antagonism to the course of the administration. In 1864 he was nominated for the vice-presidency on the ticket with Gen. McClellan, and was defeated. In 1868 he was the western candidate for the nomination for the presidency, but was defeated by Horatio Seymour, who failed of a majority in all the western states except Kentucky and Oregon. Mr. Pendleton was one of the most prominent leaders of the "greenback" party, strongly opposing the payment of the government bonds in gold, and condemning the contraction of the currency which took place, 1865–74. He was U. S. minister to Germany, 1885–89. D. 1889.

PENDULUM, in its widest scientific sense, denotes a body of any form or material which, under the action of some force, vibrates about a position of stable equilibrium. In its more usual application, however, this term is restricted, in conformity with its etymology (Lat. *pendeo*, to hang), to bodies suspended from a point, or oscillating about an axis, under the action of gravity, so that, although the laws of their motion are the same, rocking-stones (q.v.), magnetic needles, turning-forks, balance wheel of a watch, etc., are not included in the definition.

The *simple* pendulum consists (in theory) of a heavy point or particle, suspended by a flexible string without weight, and therefore constrained to move as if it were always on the inner surface of a smooth spherical bowl. If such a pendulum be drawn aside into a slightly inclined position, and allowed to fall back, it evidently will oscillate from side to side of its position of equilibrium, the motion being confined to a vertical plane. If, instead of being allowed to fall back, it be projected horizontally in a direction perpendicular to that in which gravity tends to move it, the bob will revolve about its low-

est position; and there is a particular velocity with which, if it be projected, it describes a circle about that point, and is then called a *conical* pendulum. As the theory of the simple pendulum can be very easily explained by reference to that of the conical pendulum, we commence with the latter, which is extremely simple. To find the requisite velocity, we have only to notice that the (so-called) centrifugal force (q.v.) must balance the tendency towards the vertical. This tendency is not directly due to gravity, but to the tension of the suspending cord. In the fig. let O be the point of suspension, OA the pendulum in its lowest position, P the bob in any position in the (dotted) circle which it describes when revolving as a conical pendulum; PB, a radius of the dotted circle, is evidently perpendicular to OA. Now, the centrifugal force is directly as the radius PB of the circle, and inversely as the square of the time of revolution. Also the radius PB is PO sin. BOP, the length of the string multiplied by the sine of the angle it makes with the vertical; and the force towards the vertical is proportional to the earth's attraction, and to the tangent of the above angle—as may be at once seen from the consideration that the three forces acting on the bob at P are parallel, and therefore proportional, to the sides of the triangle OBP. Hence the square of the time of revolution is directly as the length of the string and the sine of the angle BOP, and inversely as the earth's attraction and the tangent of the same angle; or (what is easily seen to be equivalent) to the length of the string and the cosine of its inclination to the vertical directly, and to the earth's attraction inversely. Hence, in any given locality, all conical pendulums revolve in equal times, whatever be the lengths of their strings, so long as their *heights* are equal; the height being the product of the length of the string by the cosine of its inclination to the vertical. Also the squares of the times of revolution of conical pendulums are as their heights directly, and as the earth's attraction inversely.

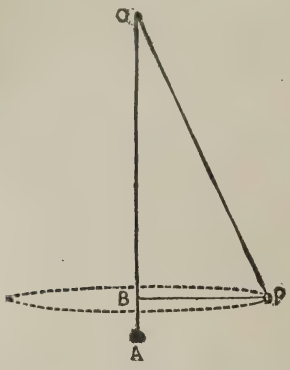

Fig. 1.

Now, *so long as a conical pendulum is deflected only through a very small angle from the vertical*, the motion of its bob may be considered as compounded of two equal simple pendulum oscillations in directions perpendicular to each other, such as it appears to make to an eye on a level with it, and viewing it at some distance, first from one point, say on the n., and then from another 90° round, say on the east. And these motions take place, by Newton's second law (see Motion, Laws of), independently. Also the time of a (double) oscillation in either of these directions is evidently the same as that of the rotation of the conical pendulum. Hence, for *small arcs of vibration*, the square of the time of oscillation of a simple pendulum is directly as its length, and inversely as the earth's attraction. Thus, the length of the second's pendulum at London being 39.1393 in., that of the half-second's pendulum is 9.7848 in., or one-fourth, that of the two-seconds' pendulum 156.5572 in., or four times that length. It follows from the principal now demonstrated, that so long as the arcs of vibration of a pendulum are all small relatively to the length of the string, they may differ considerably in length among themselves without differing appreciably in time. It is to this property of pendulum oscillations, known as isochronism (q.v.), that they owe their value in measuring time. See Horology.

That the times of vibration of different pendulums are as the square roots of their lengths, may be demonstrated to the eye by a very simple experiment. Suspend three musket balls on double threads as in the figure, so that the heights in the dotted line may be as 1, 4, and 9. When they are made to vibrate simultaneously, while the lowest ball makes one oscillation the highest will be found to make three, and the middle ball one and a half.

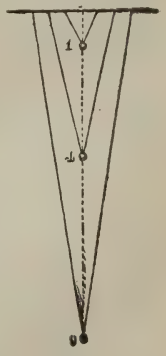

Fig. 2.

A pendulum of *given* length is a most delicate instrument for the measurement of the relative amounts of the earth's attraction at different places. Practically, it gives the kinetic measurement of gravity, which is not only by far the most convenient, but also the true measure. By this application of the pendulum, the oblateness of the earth has been determined, in terms of the law of decrease of gravity from the poles to the equator. The instrument has also been employed to determine the mean density of the earth (from which its mass is directly derivable), by the observation of its times of vibration at the mouth and at the bottom of a coal-pit. It was shown by Newton that the force of attraction at the bottom of a pit depends only upon the internal nucleus which remains when a shell, everywhere of thickness equal to the depth of the pit, has been supposed to be removed from the whole surface of the earth. The latest observations by this method were made by Airy, the present astronomer-royal, in the Harton coal-pit, and gave for the mean destiny of the earth a result nearly equivalent

to that deduced by Cavendish and Maskelyne from experiments of a totally different nature. See EARTH.

If the bob of the simple pendulum be slightly displaced in any manner, it describes an ellipse about its lowest position as center. This ellipse may, of course, become a straight line or a circle, as in the cases already considered. The bob does not accurately describe the same curve in successive revolutions: in fact, the elliptic orbit just mentioned rotates in its own plane about its center, in the same direction as the bob moves, with an angular velocity nearly proportional to the area of the ellipse. This is an interesting case of *progression of the apse* (Apsides, q.v.), which can be watched by any one who will attach a small bullet to a fine thread; or, still better, attach to the lower end of a long string fixed to the ceiling a funnel full of fine sand or ink which is allowed to escape from a small orifice. By this process, a more or less permanent trace of the motion of the pendulum is recorded, by which the elliptic form of the path and the phenomena of progression are well shown.

According to what is stated above, there ought to be no progression if the pendulum could be made to vibrate simply in a straight line, as then the area of its elliptic orbit vanishes. It is, however, found to be almost impossible in practice to render the path absolutely straight: so that there always is from this cause a slight rate of change in the position of the line of oscillation. But as the direction of this change depends on the direction of rotation in the ellipse, it is as likely to effect the motion in one way as in the opposite, and is thus easily separable from the very curious result obtained by Foucault, that on account of the earth's rotation, the plane of vibration of the pendulum *appears to turn* in the same direction as the sun, that is, in the opposite direction to the earth's rotation about its axis. To illustrate this now well-known case, consider for a moment a simple pendulum vibrating at the *pole* of the earth. Here, if the pendulum vibrates in a straight line, the direction of that line remains absolutely fixed in space, while the earth turns round below it once in 24 hours. To a spectator on the earth, it appears, of course, as if the plane of motion of the pendulum were turning once round in 24 hours, but in the opposite direction. To find the amount of the corresponding phenomenon in any other latitude, all that is required is to know the rate of the earth's rotation about the vertical in that latitude. This is easy, for velocities of rotation are resolved and compounded by the same process as forces, hence the rate at which the earth rotates about the vertical in latitude λ is less than that of rotation about the polar axis in the ratio of sin. λ to 1. Hence the time of the apparent retation of the plane of the pendulum's motion is $\frac{24 \text{ hours}}{\text{sin. } \lambda}$. At the pole, this is simply 24 hours; at the equator, it is infinitely great, or there is no effect of this kind: in the latitude of Edinburgh (56° 57′ 23.2″), it is 28.63 h., or 28 h. 37 m. 48 seconds.

We have not yet alluded to the obvious fact, that a *simple* pendulum, such as we have described above, exists in theory only, since we cannot procure either a single heavy particle or a perfectly light and flexible string. But it is easily shown that a rigid body of any form whatever vibrates about an axis under the action of gravity, acccording to the same law as the hypothetical simple pendulum. The length of the equivalent simple pendulum depends upon what is called the radius of gyration (see CENTER OF GYRATION) of the pendulous body. Its property is simply this, that if be the same as that of the complex body. The square of the radius of gyration of a body about any axis, is greater than the square of the radius of gyration about a parallel axis through the center of gravity, by the square of the distance between those lines. Now, the length of the simple pendulum equivalent to a body oscillating about any axis is directly as the square of the radius of gyration, and inversely as the distance of the center of gravity from the axis. Hence, if k be the radius of gyration of a body about an axis through the center of gravity, $\sqrt{k^2+h^2}$ is that about a parallel axis whose distance from the first is h; and the length, l, of the equivalent simple pendulum is $l = \frac{k^2+h^2}{h}$

This expression becomes infinitely great if h be very large, and also if h be very small (that is, a body vibrates very slowly about an axis either far from, or near to, its center of gravity). It must therefore have a minimum value. By solving the equation above as a quadratic in h, we find that l cannot be less than $2k$, which is, therefore, the length of the simple pendulum corresponding to the quickest vibrations which the body can execute about any axis parallel to the given one. In this case the value of h is equal to k. Hence, if a circular cylinder be described in a body, its axis passing through the center of gravity, and its radius being the radius of gyration about the axis, the times of oscillation about all generating lines of this cylinder are equal, and less than the times of oscillation about any other axis parallel to the given one. Also, since the formula for l, above given, may be thus written, $h(l-h)=k^2$, it is obvious that it is satisfied if $l-h$ be put for h. Hence, if any value l (of course not less than $2k$) be assigned as the length of the equivalent simple pendulum, there are *two* values of h which will satisfy the conditions; that is, there are two concentric cylinders, about a generating line of either of which the time of oscillation is that of the assigned simple pendulum. When $l=2k$, these cylinders coincide, and form that above described. And, since the sum of the

radii of these cylinders is l, it is obvious that if we can find experimentally two parallel axes about which a body oscillates in equal times, and if the center of gravity of the body lie *between* these axes, and in their plane, *the distance between these axes is the length of the equivalent simple pendulum.* This result is of very great importance, because it enabled Kater (who was the first to employ it) to use the complex pendulum for the determination of the length of the simple second's pendulum in any locality. The simple pendulum is perfect in theory, but cannot be constructed; and thus the method which enables us to obtain its results by the help of such a pendulum as we can construct, is especially valuable.

Compensation Pendulum.—As the length of a rod or bar of any material depends on its temperature (see HEAT), a clock with an ordinary pendulum goes faster in cold, and slower in hot, weather. Various contrivances have been devised for the purpose of diminishing, if not destroying, these effects. The most perfect in theory, though perhaps not the most available in practice, is that of sir D. Brewster (q.v.), founded upon the experimental discovery of Mitscherlich, that some crystals *expand* by heat in one direction, while *contracting* in the perpendicular one; and therefore that a rod may be cut out of the crystal in such a direction as not to alter in length by any change of temperature. In the method of correction usually employed, and called *compensation*, advantage is taken of the fact that different substances have different coefficients of linear dilatation; so that if the bob of the pendulum be so suspended as to be raised by the expansion of one substance, and depressed by the expansion of another, the lengths of the effective portions of these substances may be so adjusted that the raising and depression, taking place simultaneously, may leave the position of the bob unaffected. There are two common methods of effecting this, differing a little in construction, but ultimately depending on the same principle. Of these, the *mercurial* pendulum is the more easily described. The rod AC, and the framework CB, are of steel. Inside the framework is placed a cylindrical glass jar, nearly full of mercury, which can be raised or depressed by turning a nut at B. By increase of temperature, the steel portion AB is lengthened by an amount proportioned to its length, its coefficient of linear dilatation, and the change of temperature, conjointly—and thus the jar of mercury is removed from the axis of suspension. But neglecting the expansion of the glass, which is very small, the mercury rises in the jar by an amount proportional to its bulk, its coefficient of cubical dilatation, and the change of temperature conjointly. Now, by increasing or diminishing the quantity of mercury, it is obvious that we may so adjust the instrument that the length $\left(\frac{k^2}{h}\right)$ of the equivalent simple pendulum shall be unaltered by the change of temperature, whatever be its amount, so long as it is not great enough to sensibly change the coefficients of dilatation of the two metals. The screw at B has nothing to do with the *compensation*, its use is to adjust the length of the pendulum so that it shall vibrate in one second.

FIG. 3.

The construction of the *gridiron* pendulum will be easily understood from the cut. The black bars are steel, the shaded ones are brass, copper, or some substance whose co-efficient of linear dilatation is more than double that of steel. It is obvious from the figure that the horizontal bars are merely connectors, and that their expansion has nothing to do with the vibration of the pendulum, so they may be made of any substance. It is easily seen that an increase of temperature lowers the bob by expanding the steel rods, whose effective length consists of the sum of the lengths of A*a*, BC, and the steel bar to which the bob is attached; while it raises the bob by expanding the brass bars, whose effective length is that of one of them only; the other, as well as the steel rod *bc*, being added to the instrument for the sake of symmetry, strength, and stiffness only. If the effective lengths of steel and brass be inversely as their respective dilatation co-efficients, the position of the bob is unaltered by temperature; and therefore the pendulum will vibrate in the same period as before heating. This is on the supposition that the weight of the frame-work may be neglected in comparison with that of the bob; if this weight must be taken into account, the requisite adjustments, though possible, are greatly more complex, and can only be alluded to here. Practically, it is found that a strip of dry fir-wood, carefully varnished to prevent the absorption of moisture, and consequent hygrometric alterations of its length, is very little affected by change of temperature; and, in many excellent clocks, this is used as a very effective substitute for the more elaborate forms just described. To give an idea of the nicety which modern astronomy requires in the construction of an observing-clock, we may mention that the Russian astronomers find the gridiron superior to the mercurial pendulum; because differences of temperature at different parts of the clock case (though almost imperceptible in a properly protected instrument), may heat the steel or the mercury unduly in the latter; while, in the former, the steel and brass bars run side by side through the greater part of the length of the pendulum, and are thus simultaneously affected by any such alterations of temperature.

FIG. 4.

It would lead us into details of a character far too abstruse for the present work to treat of the effects of the hydrostatic pressure and viscosity of the air upon the motion of a pendulum.

PENDS D'OREILLES. See KALISPELS.

PENEDO, a flourishing t. of Brazil in the state of Alagoas, 185 m. s.w. of Pernambuco, on the San Francisco near its mouth. In the district, cotton, rice, and other crops are grown. Pop. of town, 9,000.

PENEL'OPE, bird. See GUAN.

PENEL'OPE, in Homeric legend, the wife of Ulysses (Odysseus), and mother of Telemachus, who was still an infant when Ulysses went to the Trojan war. During his long wanderings after the fall of Troy he was generally regarded as dead, and Penelope was vexed by the urgent suits of many lovers, whom she put off on the pretext that she must first weave a shroud for Laertes, her aged father-in-law. To protract the time she undid by night the portion of the web which she had woven by day. When the suitors had discovered this device her position became more difficult than before; but fortunately Ulysses returned in time to rescue his chaste spouse from their distasteful importunities. Later tradition represents Penelope in a very different light, asserting that by Hermes (Mercury), or by all her suitors together, she became the mother of Pan (q.v.), and that Ulysses, on his return, divorced her in consequence. But the older Homeric legend is the simpler and more genuine version of the story.

PENGUIN, *Aptenodytes*, a genus of birds of the family *alcidæ* (see AUK), or constituting the family *aptenodidæ*, regarded by many as a sub-family of *Alcidæ*, and divided into several genera or sub-genera. They have short wings, quite unfit for flight, but covered with short rigid scale-like feathers, admirably adapted for swimming, and much like the flippers of turtles. The legs are very short, and are placed very far back, so that on land penguins rest on the tarsus, which is widened like the sole of the foot of a quadruped, and maintain a perfectly erect posture. Their bones, unlike those of birds in general, are hard, compact, and heavy, and have no air-cavities; those of the extremities contain an oily marrow. The body is of an elliptical form; the neck of moderate length; the head small; the bill moderately long, straight, more or less compressed; the tail very short. Some of them have a long, slender, and pointed bill, the upper mandible a little curved at the tip, and feathered for about a third of its length; some, sometimes called gorfews or gorfous (*chrysocoma*), have a stout and pointed bill, a little curved at the tip; some, sphenisques or spheniscans (*spheniscus*), have a straight and compressed bill, irregularly furrowed at the base. The penguins are all among the most aquatic birds, although they are seldom seen very far out at sea; but it is only in the breeding season that they spend much time on shore. They are found only in the southern hemisphere, and chiefly in high southern latitudes, although some of the species extend into warm regions, as *spheniscus Humboldtii* to the coast of Peru. Of this species, which is called *Paxara niño*, or child bird, by the Peruvians, Tschudi states that it is easily tamed, becomes very sociable, and follows its master like a dog, waddling along in a very amusing manner with its plump body and short legs, keeping its balance by motions of its little wings. It displays considerable intelligence, and learns to answer to its name. In some of the furthest antarctic regions peguins are prodigiously numerous, appearing on the shore like regiments of soldiers, or, according to another similitude which has been used by a voyager, like bands of little children in white aprons. They often occupy for their breeding ground a space of several acres, which is laid out and leveled and divided into squares, as nicely as if it had been done by a surveyor; whilst between the compartments they march as accurately as soldiers on parade. The KING PENGUIN (*A. Patachonica*) a large species, of the size of the great auk, dark grayish-blue above, white beneath, with a black head and a yellow curved band on the throat, is found in such numbers on some of the sandy antarctic coasts that Mr. Bennett describes one breeding-ground on Macquarie island as covering thirty or forty acres, and, to give some notion of the multitudes, speaks of 30,000 or 40,000 birds as continually landing and as many putting to sea. On many of the antarctic shores the penguins do not flee from nor seem to dread the presence of man, remaining as if stupidly indifferent, even when their companions are knocked on the head; their very indifference, it is said, suggesting the idea of loneliness and desolation more powerfully than if there were a total absence of life. When attacked, however, they often show courage in self-defense, and are ready to run with open bill at an invader. The young are reckoned good eating; the old are said to be black and tough. The name penguin is said to be derived from the Latin *pinguis*, fat.—Penguins make no nest, but lay a single egg in a chosen place on the shore; and the egg is carefully tended both by male and female. The female penguin keeps charge of her young for nearly twelve months.—Many of the penguins are birds of bright plumage.—Cuttlefish, and other *cephalopoda*, form a great part of their food. Their voice is loud and harsh, between a quack and a bray, but there are many diversities in the different species.

PENHALLOW, SAMUEL, 1665–1726; came to Massachusetts with Charles Morton, his teacher, in 1686. Removing to Portsmouth, N. H., he was made treasurer of the province, judge of the superior court, and in 1717 chief justice. He wrote a *History of the Indian Wars of New England from* 1703 *to* 1726.

PEN-HOLDERS are small turned sticks, usually of cedar, and generally with a steel cylinder to fix the pen. They are used only for metal pens, and are now made by machinery, which is so ingenious that it turns the cedar, previously cut into square sticks,

round, often in a spiral or otherwise ornamental style, cuts them to the required length, and polishes and varnishes them.

PENICILLA'RIA. See GUINEA CORN and MILLET.

PENIKESE ISLAND. See ELIZABETH ISLANDS.

PENINSULAR STATE. See STATES, POPULAR NAMES OF.

PENITENTIAL PSALMS, seven of the psalms of David, so called as being specially expressive of sorrow for sin, and accepted by Christian devotion as forms of prayer suitable for the repentant sinner. They are psalms vi., xxxii., xxxviii., li., cii., cxxx., and cxliii., according to the authorized version, which correspond with vi., xxxi., xxxvii., l., ci., cxxix., and cxlii. of the vulgate. These psalms have been set apart from a very early period, and are referred to as such by Origen (Hom. ii., in Leviticum). Pope Innocent III. ordered that they should be recited in Lent. They have a special place in the Roman breviary, and more than one of the popes attached an indulgence to the recital of them. The most deeply penitential, and the most frequent in use, both public and private, is the 51st Psalm, or the *Miserere* (50th in the Vulgate).

PENITENTIARIES, strictly so called, are institutions for the reception of penitent women, in which confinement is purely voluntary. The name has also been applied to prisons under the separate system, having been adopted by the Quakers of Pennsylvania in 1786, when they caused the legislature of that state to abolish the punishments of death, mutilation, and the whip, and to substitute solitary confinement as a reformatory process. (See CONVICT; PRISONS.) The penitentiaries of the first-mentioned kind are often known as Magdalen asylums or female refuges. Most of the institutions of this kind in the United Kingdom are associated under the auspices of the reformatory and refuge union, an association which embraces also reformatories, industrial schools, and other like institutes. In 1877 the union had on its list 65 penitentiaries or homes for fallen women in England (15 in London), and 12 in Ireland and Scotland.

PENITENTIARY (Lat. and Ital. *penitentiariæ*), the name given to one of the offices of the Roman court, and also to the dignitary (a cardinal, called *penitentiarius*) who presides over it. The cardinal penitentiary must be a priest and a doctor of theology or canon law. He is named by the pope himself, and should the penitentiary die while the Roman see is vacant, the cardinals must be specially assembled to elect by secret scrutiny a pro-penitentiary to act for the time. The officials of the penitentiary, under the cardinal penitentiary, are a regent, three secretaries, three clerks, a corrector, a consulter in theology, and another in canon law, and one or two minor officers. The subjects which come under the notice of the penitentiary are all matters relating to the confessional, especially the absolution from sins and from canonical censures, reserved to the pope, and in certain cases dispensations from the impediments of marriage.

PENJDEH, or PUNJ DEEN, an oasis in the n.w. part of Afghanistan, 130 m. n. of Herat; lat. 36° 4′ n.; long. 62° 41′ e. It is triangular in shape, formed by the Murghab river; comprises an area of 300 sq.m.; its greatest length is abt. 27 m.; and its greatest breadth abt. 20 m. It was an integral part of the province of Herat, to which it paid tribute, and with which it is connected by a road. Its population consists of about 8000 Sariks, who occupy themselves chiefly in raising flocks and weaving carpets and fine cloths. A conflict occurred, 1885, March, between a body of Afghan troops occupying P. and a Russian force under Gen. Komaroff stationed on the neighboring boundary. The Afghans were routed, and the Russians took possession of P. This event added a serious element to the boundary dispute between England and Russia, and became the subject of special investigations, reports, and negotiations in St. Petersburg and London, accompanied with extensive military preparations; but the threatened war was averted.

PENN, JOHN, 1729–95; b. England, grandson of William and son of Richard. He was governor of Pennsylvania, 1763–71, and 1773–75; and inherited one-third of the province in 1771. He was not unfavorable to the colonial side in the revolution, but was suspected and imprisoned by congress, which finally ordered his release on parole.

PENN, JOHN, 1741–88; b. Va.; read law with Edmund Pendleton and was called to the bar. He settled in North Carolina in 1774, and was one of its representatives in congress, 1775–76, and 1778–80. He was a signer of the declaration of independence, and afterwards, during the invasion of North Carolina by Cornwallis, was at the head of the affairs of that state, of which he was receiver of taxes in 1784.

PENN, JOHN, LL.D., 1760–1834; b. England; grandson of William Penn. He was educated at Cambridge, and succeeded his father Thomas as hereditary governor of Pennsylvania in 1775. He published among other works *The Battle of Edington*, a tragedy, 1792; *Critical, Poetical, and Dramatic Works*, 1778, and *Poems*, 1801.

PENN, RICHARD, 1735–1811; b. England; brother of John. He was proprietary governor of Pennsylvania, 1771–73, and won the confidence of the colonists by his liberal course. In 1775 he carried a petition of congress to the king, and was examined by the house of lords on American affairs.

PENN, THOMAS, 1702–75; b. Penn.; son of William Penn. When about 45 years old he went to England, where he married a daughter of the earl of Pomfret. In 1746

he inherited two-thirds of the proprietary interest in the province. He was noted as the founder of the Philadelphia college and as a patron of many benevolent and literary societies.

PENN, Sir WILLIAM, 1621–70; b. Bristol, Eng.; entered the British navy, was made cap. in 1642 and admiral in 1653, the latter promotion being given him as a reward for his services in the naval contests with the Dutch. In 1655 he was prominent in the capture of Jamaica from the Spaniards. From 1655 to 1664 he remained in England, and was returned to parliament from Weymouth, but was sent to the tower on the charge of having left his command without permission. By Charles II. he was made a knight, commissioner of the navy, governor of Kinsale, and vice-admiral of the navy. In 1664 he again went to sea and was the duke of York's commander-in-chief at the great naval victory of 1665 over the Dutch. In 1669 he retired from actual service. Sir William was the father of the founder of Pennsylvania.

PENN, WILLIAM, a celebrated English Quaker and philanthropist, the founder of the colony of Pennsylvania, was the son of sir William Penn, an eminent English admiral, and was born at London, Oct. 14, 1644. His early years were spent partly in Essex and partly in Ireland, where his father had several estates. Penn studied at Christ church, Oxford, and while here was converted to Quakerism by the preaching of a disciple of George Fox, named Thomas Loe. His enthusiasm for his new faith assumed a pugnacious form. Not only did he object personally to attend the services of the church of England, and to wear the surplice of a student—both of which he considered eminently papistical—but, along with some companions who had also become Quakers, he attacked several of his fellow-students, and tore the obnoxious robes from their backs. For this unseemly procedure Penn was expelled from the university. His father was so excessively annoyed at his conduct, that he gave Penn a beating, and turned him out of doors; but he soon afterwards mollified, and sent his son to travel on the continent, in the hope that change of scene and the gayety of French life would change the bent of his mind. They failed, however, to effect this, but the youth certainly acquired a grace and suavity of address that he did not before possess. In 1666 the admiral sent him to Ireland to look after his estates in the county of Cork, which Penn did to his father's complete satisfaction; for in matters of business he was as practical an Englishman as in religion he was an out-and-out mystic. In the city of Cork, however, he again fell in with Thomas Loe, and for attending a Quaker meeting was, along with some others, imprisoned by the mayor, but was immediately afterwards released on appealing to the lord president of the council of Munster, who was personally acquainted with him. On his return to England, Penn and his father again quarreled, because the "conscience" of the former would not allow him to take off his hat to anybody—not even to the king, the duke of York, or the admiral himself. Penn was again turned out of doors by his perhaps testy, but assuredly provoked parent. The mother, however, stepped in, and smoothed matters so far that Penn was allowed to return home, and the admiral even exerted his influence with the government to wink at his son's attendance at the illegal conventicles of the Quakers, which nothing would induce him to give up. In 1668, however, he was thrown into the tower, on account of a publication entitled *The Sandy Foundation Shaken,* in which he attacked the ordinary doctrines of the Trinity, God's "satisfaction" in the death of Christ, and justification by the imputation of Christ's righteousness. While in prison he wrote the most famous and popular of his books, *No Cross, no Crown,* and *Innocency with her Open Face,* a vindication of himself, which contributed to his liberation, which was obtained through the interference of the duke of York. In Sept., 1670, admiral Penn died, leaving his son an estate of £1500 a year, together with claims upon government for £16,000. In 1671 the upright but incorrigible sectary was again committed to the tower for preaching, and as he would not take an oath at his trial, he was sent to Newgate for six months. Here he wrote four treatises; one of them, entitled *The Great Cause of Liberty of Conscience,* is an admirable defense of the doctrine of toleration. After regaining his liberty he visited Holland and Germany, along with Fox and Barclay, for the advancement of Quakerism. The countess palatine Elizabeth, the granddaughter of James I., showed him particular favor. On his return, he married, in the beginning of 1672, Gulielma Maria Springett, daughter of sir William Springett, and for some years thereafter continued to propagate, by preaching and writing, the doctrines of his sect. Circumstances having turned his attention to the new world, he, in 1681, obtained from the crown, in lieu of his monetary claim upon it, a grant of the territory now forming the state of Pennsylvania. Penn wanted to call it Sylvania, on account of its forests; but the king (Charles II.) good-humoredly insisted on the prefix Penn. His great desire was to establish a home for his co-religionists in the distant west, where they might preach and practice their convictions in unmolested peace. Penn, with several friends, sailed for the Delaware in Aug., 1682, was well received by the settlers, and on Nov. 30th held his famous interview with the Indian tribes, under a large elm tree at Shackamaxon, now Kensington. He next planned and named the city of Philadelphia, and for two years governed the colony in the wisest, most benevolent, and liberal manner. Not only Quakers, but persecuted members of other religious sects, sought refuge in his new colony, where, from the first, the principle of toleration was established by law. Having called the colonists together, he gave the infant state a constitution in twenty-four articles. Towards the end of the reign of

Charles II., Penn returned to England to exert himself in favor of his persecuted brethren at home. His influence with James II.—an old friend of his father's—was so great, that many people then, and some even yet, do not feel quite satisfied about the nature of their relations; but the suspicion that he allowed himself to be used as a tool by the court is really not justified by any known facts. It is possible, for his position was equivocal, but it is not proven, and lord Macaulay—who has urged the view of his complicity in some of the disgraceful incidents that followed Monmouth's rebellion, with an ungracious animosity—has been convicted of haste and inaccuracy in several important particulars. At any rate, his exertions in favor of the Quakers were so far successful, that in 1686 a proclamation was issued to release all persons imprisoned on account of their religious opinions, and more than 1200 Quakers were set free. In the April following, James issued an edict for the repeal of all religious tests and penalties, but the mass of non-conformists mistrusted his sincerity, and refused to avail themselves of it. After the accession of the prince of Orange as William III., Penn was twice accused of treason, and of corresponding with the exiled monarch, but was acquitted. In 1690 he was arrested on a charge of conspiracy, but was again acquitted. Nevertheless, in the following year, the charge was renewed. Nothing appears to have been done for some time, but Penn at last, through the kindly offices of his friends, Locke, Tillotson, and others, had the matter thoroughly investigated, and he was finally and honorably acquitted, Nov., 1693. Shortly after, his wife died, but in less than two years he married again. His second wife, Hannah Callowhill, was a Bristol lady. In 1699 he paid a second visit to the new world, and found Pennsylvania in a prosperous condition. His stay, which lasted two years, was marked by many useful measures, and by efforts to ameliorate the condition both of the Indians and negroes. Penn departed for England towards the end of 1701, leaving the management of his affairs to a Quaker agent named Ford, whose villainy virtually ruined Penn. When the rogue died, he left to his widow and son false claims against his master, and these were so ruthlessly pressed, that Penn allowed himself to be thrown into the Fleet in 1708, to avoid extortion. His friends afterwards procured his release, but not till his constitution was fatally impaired. Penn died at Ruscombe, in Berkshire, July 30, 1718. He left issue by both marriages. Upon the Penn controversy it is unnecessary further to enter. We refer our readers to Macaulay's *History of England* (1849–55); Hepworth Dixon's *Life of Penn* (new edit. 1856); J. Paget's *Inquiry into the Evidence of the Charges brought by Lord Macaulay against William Penn* (Edin., 1858), and Stoughton's *William Penn* (new ed., 1883).

PEN'NALISM, the name given to a practice once prevalent in the Protestant universities of Germany, which seems to have been essentially the same as the fagging (q.v.) of the English public schools. The freshmen or students of the first year (called *pennals* —i.e., *pen-cases;* fags) were considered by the elder students ("schorists") as virtually their servants. Whatever property the pennals had they must give up to the schorists, who now employed them in the meanest offices, made laughing-stocks of them, and beat and ill-used them—all which had to be endured without complaint. After a year of this discipline followed the ceremony of "deposition"—a practice older than pennalism itself, and borrowed probably from knightly consecration—in which the pennal underwent a number of symbolical trials, indicative generally of purgation from impurity and consecration to an intellectual life. Pennalism is said to have been introduced in the beginning of the 17th c., and to have been mostly confined to the Protestant universities of Germany. But although the full development of the system may have been thus restricted, germs and modifications of it were much earlier and more general, as is manifest from the prevalence of names of contempt for first year's students (see Bejan), and from statutes passed by French universities as early as the middle of the 14th c., against levying payments for first footing from them. See also Fagging. The servitude imposed on the pennals was probably an aping of the usage of chivalry, by which a candidate for knighthood had to serve for a time as page to one already a knight. All attempts to check the evils of pennalism were long unavailing, as the pennals took part with the schorists in resisting all regulations of the authorities, which would have deprived them of the hope of exercising in their turn a like tyranny upon others. Edicts against the practice were issued in Jena and other universities about the beginning of the 17th c., but it was not till the last half of the century that the universities, by uniting in severe measures, were able to check the evil; and traces of it survived for a long time afterwards. In imitation of the students, a kind of pennalism was adopted by other bodies, more particularly by the printers, who retained the ceremony of "deposition" after it had disappeared from the universities.—Schöttgen, *Historie des Pennalwesens* (Dresd. 1747).

PENNANT, Thomas, ll.d., tourist, naturalist, and antiquary, was b. June 14, 1726, at Downing in Flintshire, and educated at Queen's and Oriel colleges, Oxford. His first important publication was the *British Zoology* (1761–69), which contained in all 132 plates on imperial paper, engraved by Mazel, and established his reputation. While the work was in course of publication, Pennant made a trip to the continent, and saw some of the scientific and literary celebrities of the time, as Buffon, who has favorably mentioned him in his great work on *Natural History*, Voltaire, Haller, the two Gesners, and Pallas. In 1769 he made the first of his famous tours in Scotland, penetrating to the

remotest part of the country, which, he says, was then "almost as little known as Kamtchatka." He returned with a very good opinion of it, and published his report in 1771, in consequence of which (according to him) Scotland has "ever since been *inondée* with southern visitants." The year before, he added 103 plates to his *British Zoology*, with descriptive notices; and in 1771 printed at Chester his *Synopsis of Quadrupeds*, subsequently enlarged and improved under the title of *History of Quadrupeds*. Of this work Cuvier says: "It is still indispensable to those who wish to study the history of quadrupeds." In the same year the university of Oxford conferred on him the degree of LL.D. Next year he undertook his second and most important tour in Scotland, which included a voyage to the Hebrides (an account of which appeared in 3 vols. 1775). Pennant was warmly welcomed by the inhabitants. Almost every corporated town paid him some formal compliment, and he returned "rich in civic honor." In 1773 he published his *Genera of Birds*, and made an antiquarian tour through the north of England. His subsequent tours through Wales do not require special notice. In 1777 appeared a fourth volume of his *British Zoology*, containing the vermes, the crustaceous, and the testaceous animals of the country. Among a great variety of later miscellaneous publications, we may mention in particular an amusing life of himself (*The Literary Life of the late Thomas Pennant, Esq., by himself*, 1793). He died Dec. 16, 1798.

PENNAT'ULA, a genus of zoophytes (*anthozoa*), allied to gorgonia (q.v.) and *alcyonium* (q.v.), and having very similar polyps; but the polyp mass is not fixed by its base, has a fleshy stem strengthened by a bone, and a skin containing calcareous spiculæ, the upper part of the stem winged on two sides, with numerous pinnæ, along the upper margins of which the polyp-cells are ranged. The whole form somewhat resembles a quill, so that the popular name SEA PEN is very often given to these zoophytes. One species *pennatula phosphorea*, is common on the northern parts of the British coast. It is from two to four inches in length, of a purplish-red color, and like many—perhaps all—of the other species, is sometimes brilliantly phosphorescent, emitting flashes of light when disturbed, but ceasing to be luminous on relapsing into quiescence. The stalk is hollow in the center, and the bone which it contains—and which is composed of phosphate and carbonate of lime, like the bones of the vertebrate animals—is a very remarkable part of its structure, not extending the whole length of the stalk, slender, straight, and perfectly simple, but bent backwards at each end into a hook. Other species are found in the Mediterranean and other seas, some of them more pen-like than even the British one. It has been alleged that they swim by contractions and dilatations of their common fleshy substance, or by movements of the pinnæ; but there is no good evidence of their possessing any such power of locomotion, which is very contrary to the analogy of all similar zoophytes, and more probably the opinion prevalent among the fishermen of the Scottish coasts is the correct one, that their natural place is at the bottom of the sea, with the somewhat flexible lower end of the stalk immersed in mud. Nearly allied to the pennatulæ is another genus of extremely beautiful zoophytes, *virgularia*, ranked with them in the family *pennatulidæ*, and sometimes receiving the name SEA RUSH.

PENNINGTON, a co. in s.w. S. Dakota; formed, 1875; organized, 1877. Area, 1521 sq.m.; pop. 1890, 6540. Co. seat, Rapid City.

PENNINGTON, WILLIAM SANFORD, 1757–1826; b. N. J.; served as a maj. of artillery in the revolution. In 1802 he was admitted to the bar; in 1804 became an associate judge of the supreme court, N. J.; and, 1813–15, was governor of the state; 1815–26, U. S. district judge. He was the author of *Supreme Court Reports*, 1803–26, 8vo, 1825.

PENNON, a small pointed flag carried by the mediæval knight on his lance.

PENN'S CAVE, a remarkable limestone cavern in Centre co., Pa., 14 miles e. of Bellefonte. It is more than a mile in length, with two principal corridors, one covered by a stream of water and the other, "Dry Cavern," branching off at right angles.

PENNSYLVANIA, a middle state of the Atlantic slope, one of the original 13, and the second in population; between lat. 39° 43′ and 42° 15′ n.; long. 74° 43′ 36″ and 80° 31′ 36″ w.; bounded on the n. by lake Erie and New York; on the e. by New York and New Jersey, from which it is separated by the Delaware river; on the s.e. by Delaware for a few m.; on the s. by Maryland and West Virginia; on the w. by West Virginia and Ohio. Its form is very regular, the boundaries of three sides being lines of latitude and longitude; its length from e. to w. is 302.34 m.: its breadth 175.6 m.; land area, 44,985 sq. m.; gross area, 45,215 sq. m., or 28,937,600 acres. It is called the Keystone State from its position and importance among the original thirteen.

HISTORY.—The first visitor of Delaware bay was Capt. Henry Hudson, in 1609; lord de la Warr, however, in honor of whom the bay and river are named, accidentally discovered its mouth in 1610. The Dutch built Fort Nassau on the Delaware river in 1623; but the first actual settlement was by Swedish colonists at Tinicum island in 1643. In 1655 the Dutch from New Amsterdam took possession of the whole territory between the Delaware and the Hudson river, and held it until 1664, when New Netherlands was conquered by the English; recovered by the Dutch in 1673, it reverted to British rule in 1674. The first European settlement was Fort Nassau, near

Gloucester, in New Jersey. Fort Oplandt was built near Lewistown, Delaware. The first Dutch settlers were murdered by the Indians; but the Swedes, who followed and settled on the w. bank of the Delaware, were more successful, but their success involved them in trouble with the Dutch, to whom they finally succumbed. In 1681 a charter for the territory 12 m. n. of New Castle to 43° n.e., bounded e. by the Delaware river, and to extend w. 5° in long. to the same degree of lat., was granted to William Penn, who landed at New Castle Oct. 27, 1682, and founded Philadelphia. His advent was auspicious, and his humane treatment of the Indians and the colonists caused the new colony to flourish. In 1684 there were already upwards of 300 houses in Philadelphia, with a population of 2500, and of 7000 in the province and territory. Penn was temporarily deprived of his possessions under William and Mary, and did not revisit the province until 1699. He returned to England in 1701, and died there in 1718. His widow administered the government for a while, but it passed to his children and their descendants, and the proprietary government continued until the revolution, in 1776; the affairs of Delaware (called the lower cos.) after 1699 were administered by a separate legislature under the governors of P. Between 1715 and 1725 there was a large immigration of Scotch-Irish. By charter right P. above lat. 41° belonged to Connecticut, and as the Penns had not settled it, a large portion was purchased in 1768 from the Six nations by a land association called the Connecticut Susquehanna company, and fresh settlements were begun in the Susquehanna and Delaware valleys, which were broken up by the Indians. In 1769 emigrants from Connecticut again entered, but the Indians had meanwhile resold the region to the P. proprietaries. Connecticut, however, maintained her rights, and in 1776 the co. of Westmoreland was organized under the laws of Connecticut, and was represented in the legislature of that state. The Indian massacres that had desolated P. in 1755–56 and 1763 broke out again, and in 1778, June 30, the massacre of Wyoming occurred. (See Wyoming Valley.) The boundary difficulties between P. and Maryland were settled by the survey of Mason and Dixon, begun in 1763 and ended in 1767, but the disputes with Connecticut continued till 1781, when, by a somewhat high-handed decision of a court of arbitration, the lands claimed and settled by Connecticut were adjudged to P. The development of P. during the first century of its existence may be seen by the settlement of more than 12 cos., and the founding of Philadelphia in 1682; Lancaster, 1729; York, 1740; Reading, 1748, and Carlisle in 1750. A newspaper, the *American Weekly Mercury*, was published in Philadelphia in 1719; in 1756 stage-coaches were established from Philadelphia to New York and Baltimore, and in 1757 the postal service was extended to Carlisle. The first continental congress met in Philadelphia Sept. 5, 1774. P. was foremost in resisting British encroachments, and led in all the momentous events of the revolution; independence was proclaimed on her soil, 1776. The battle of Germantown (q.v.) took place Oct. 4, 1777. Washington went to Valley Forge in December of that year. March 1, 1780, slavery was abolished. Philadelphia was the seat of government throughout the proprietary period (save for short intervals). The capital was removed to Lancaster in 1799, and remained there until 1812, when Harrisburg was selected as the permanent capital. The corner-stone of the capital was laid May 31, 1819.

The first gov. under the state constitution was Thomas Mifflin. The land of the province, although granted by royal charter, was bought by Penn, the proprietary government, and the state, of the Indians in six successive purchases: "the walking purchase" on the Delaware in 1682; the s.e. section of the province in 1736; a section running from Pike to Dauphin co. in 1749; a tract extending from Northumberland to the southern boundary in 1758; an enormous tract from the n.e to the s.w. extremities of the province in 1768; and the whole n.w. section by state commissioners in 1785. Lands obtained by the Indian treaty of 1768 were offered at £5 per 100 acres, and one penny per acre per annum quit-rent; some of the richest coal land was offered at that price. The settlement of the western country began about 1784, in which year there were at Pittsburg four lawyers and two doctors, but no minister of religion. Ten years later the population was still below 500. The triangular tract of land bounded n.w. by lake Erie was purchased in 1788 from the U. S., and the settlement of that part of the state was subsequent to that year. The whiskey rebellion, in 1794, was caused by a law of congress, passed in 1790, imposing excise duties on spirits distilled in the U. S. The tumultuous opposition to it was especially violent in western P., and attended by great disorders, which led pres. Washington to invite the military aid of Pennsylvania, New Jersey, Maryland, and Virginia for their suppression. The appearance of a body of 12,000 troops, led by Gov. Lee, was sufficient, without bloodshed, to quell the difficulty. In 1825 the Susquehanna and Delaware rivers were connected by canals, and in 1834 the Columbia line of combined railroad and canal was opened to Pittsburg. During the civil war the confederates made three invasions into P., the first of which was a raid, under Gen. Stuart, who burned the railroad depot at Chambersburg, Oct. 10, 1862; the second, under Lee, brought the whole confederate force in Virginia into the state, and culminated in the battle of Gettysburg, July 1–3, 1863 (see Gettysburg); the third, executed by a small force of Early's division, burnt the town of Chambersburg, July 30, 1864. During that war P. furnished the national army with 270 regiments, and a total of 337,936 men, besides 25,000 militia for temporary service. The establishment of "soldiers' orphan schools," for the maintenance, clothing, and education, at the public

AREA AND POPULATION OF PENNSYLVANIA BY COUNTIES.

LIBRARY
UNIVERSITY OF ILLINOIS

charge, of the children of soldiers who fell in defense of their country, redounds to the credit of the commonwealth ; the number of children thus provided for exceeded 7,000.

Topography.—The state is hilly and mountainous in the centre, rolling in the w., level in the s.e. A number of parallel ridges, with a maximum height of 2500 ft., cross it from n.e. to s.w.; they are all members of the Appalachian system and cover about one fourth of the entire area of the state. Next w. of the South mountain, on the Delaware, below Easton, are the Kittatinny or Blue mountains ; then the Broad mountains, s. of the n. branch of the Susquehanna ; the Tuscarora w. of that river ; the Sidling hills s. of the Juniata ; the Alleghany mountains ; the Chestnut and Laurel Hill ridges. The breadth of the entire mountain system of the state exceeds 200 m.; it forms numerous beautiful and fertile valleys, and encloses the richest coal fields and iron deposits in the union ; the valleys mostly conform to the general trend of the mountains ; the rivers follow similar lines, but often traverse the valleys obliquely. The Delaware enters the state about lat. 42°, and continues from that point throughout its course to Marcus Hook, as the boundary between P. and New Jersey. The river was named after lord de la Warr, who visited the bay in 1610 ; the Indians called it *Poutaxas, Marisqueton, Makeriskitton*, etc. Its length is 300 m. At the Water Gap it breaks through a narrow gorge, whose sides rise perpendicularly to near 1200 ft., and presents a truly grand spectacle. At Easton it receives the Lehigh, 90 m. long, a beautiful, rapid, and romantic stream, rising in the coal region ; the Lehigh Water Gap, below Mauch Chunk, is a very picturesque spot. Mauch Chunk, Allentown, and Bethlehem are on the Lehigh. Sixty m. s. of Easton the Delaware, with a fall of about 160 ft., reaches tide-water at Trenton ; 35 m. farther s.w. passes Philadelphia, below which city it receives the Schuylkill (Indian name, Mai-nai-unk), a stream 120 m. long, rising in the coal regions, peculiarly rich in tributaries, which passes Pottsville, Reading, Norristown, and Manayunk. Chester, New Castle, and Delaware city are below Philadelphia. (For Delaware bay, see Maryland and New Jersey.) The Susquehanna, though its n.e. branch rises in New York, is emphatically the river of P.; besides the n.e. branch it consists of the w. branch and the Juniata, and drains about 22,000 sq.m. The n.e. branch, after flowing 250 m. from its rise in Otsego lake, and receiving the Chemung or Tioga and the Lackawanna, through the beautiful Wyoming valley, unites below Northumberland with the great w. branch (200 m. long from its rise in Cambria co.), pursues its course s., until it receives the Juniata (150 m. long from its rise in the eastern slopes of the Alleghany mountains), and then turning s.e. empties, after an entire course of 500 m., into the Chesapeake bay. This river and its tributaries, justly famed for great beauty, pass through the richest and most fertile regions of the state. The two great rivers w. of the Alleghany mountains, whose junction forms the Ohio, are the Alleghany and Monongahela ; the former rising in Potter co., flows 50 m. n.w. into New York, and turning s.w. re-enters P., in Warren co., receives the Clarion river, Red Bank creek, the Kiskiminetas or Conemaugh on the left, and French and Conewango creeks on the right, all very important streams ; the Alleghany, from the point at which it re-enters the state, to that of its junction with the Monongahela at Pittsburg, is 180 m. long. The Indians called both the Ohio and the Alleghany by the latter name, the former designating in the language of the Delawares "Fair Water," just as the latter had the same meaning in that of the Senecas. The Monongahela is formed by two branches, the Monongahela proper and the Cheat river, both of which rise and flow n. in W. Virginia for a distance of 100 m.; these branches unite in Fayette co., Pa., and the river then flows n. 80 m.; at McKeesport it receives the Youghiogheny from the s.e., about 160 m. long, and in a n.w. course of 18 m. forms by the confluence with the Alleghany, which meets it from the n., the Ohio river at Pittsburg. The Ohio flows 25 m. n.w. to the mouth of the Big Beaver (the recipient of several tributaries, which together drain an area of about 6000 sq.m.), and then turning s.w. it leaves the state in Beaver co. Almost all the rivers break through the mountain chains and give natural access to its mineral and agricultural wealth. The Delaware is navigable for vessels of largest size to Philadelphia ; for steamboats to Trenton ; for smaller craft to Easton. The Susquehanna is not navigable in the state for steamboats, but both the Alleghany and Monongahela are navigable for 60 m. from their confluence, while the Ohio is one of the great water-ways to the Mississippi. There are no great lakes in P., but it borders lake Erie for 45 m., and has an excellent harbor at Erie.

Geology.—The state is occupied by azoic, mezozoic and palæozoic formations. The first prevails mostly in the south-eastern portions, crossed by the second in a belt of about 25 m. in a line from New Jersey to Maryland ; while the palæozoic marks the rest of the state. The latter may be found classified in the geological report of H. D. Rogers. Special localities indicate the presence of drift in the shape of gravel in the northern and n.w. tier of cos. Gneiss abounds in the s.e. portions of the state, and occupies a tract from Trenton to Philadelphia and up the Schuylkill ; it runs through portions of Delaware and Chester cos., traverses Northampton, Berks, Lebanon, parts of Lancaster, Dauphin, and reappears in Adams co., where it meets a similar formation along the border of the state. Within this extensive tract are found marble quarries (Philadelphia), lead and copper (Phœnixville), nickel (Lancaster co.), magnetic iron ore (Warwick, Cornwall, and other numerous points in Berks, Lebanon, and Lancaster cos.); chrome iron ore is mined in the serpentine barrens near Octoraro creek, in Lancaster co. The lower Silurian

in Lancaster, Berks, and Lehigh cos., and many central sections of the state contains vast deposits of hematite iron. New red sandstone is found in a belt of country whose northern limits stretch in a line from Durham near the Delaware across the Schuylkill below Reading, and the Susquehanna below Harrisburg to near Waynesburg; while its southern limits run on a line from Trenton, Norristown, through Lancaster co. and into Adams co. Sandstone, red shale, trap-rock, abound throughout the district; the sandstone is excellent for building purposes, and utilized for that purpose. The lower members of the palæozoic series above described dip n.w. under the auroral magnesian lower Silurian limestones, flanked by the Kittatinny and Blue mountains on the one hand, and the South mountain on the other. The entire region is very fertile, and embraces some of the richest agricultural districts of the state in the counties of Northampton, Lehigh, Berks, Lebanon, Dauphin, Cumberland, and Franklin. A similar belt of limestone country runs through Lancaster co., and in part through York; a narrow band of the same formation traverses likewise Montgomery and Chester counties. Roofing slate is found and extensively quarried in Northampton and Lehigh counties. Limestone areas are scattered in Montour, Clinton, Snyder, and Mifflin counties, and the Juniata valley, continuous in Centre co.; they extend also in a s.w. line through Blair and Bedford counties to the Maryland border. The upper Silurian and Devonian run n. and n.w. to the Alleghany mountains. The ridges in well-marked parallels, traversed by rivers and diversified by fruitful valleys, present a scenery of romantic beauty and a subalpine character, and show the different members of the gigantic palæozoic formation. The general features of that hill-region are much the same to the Alleghany mountains, w. of which they are entirely changed; round knolls, short and broken ridges, distinguish the bituminous coal region. The coal measures c. of the Alleghany stretch in three parallel beds—the northern, from Carbondale through Scranton and Wilkesbarre to the w. of Newport; almost due s. of it is found the Lehigh coal field; still farther s.w. from Mahanoy city, through Ashland and Shamokin, to within a short distance of the Susquehanna, lies the second or middle anthracite coal field, while the southern, with Pottsville in the center, extends continuously from Mauch Chunk, on the Lehigh, to Wiconisco, and by southern branch to within a short distance from the Susquehanna. The semi-bituminous coal field is in the region of the Broadtop mountain in Huntingdon and Bedford cos. The Alleghany mountains form the eastern limit of the vast bituminous coal fields which overspread the greater part of the western section of the state. Sandstone, iron ore, limestone, and fire-clay interstratify with the coal. Limestone occurs to a limited extent in the Alleghany valley, but is found more copiously in the upper portions of the Monongahela. At Johnstown, Brady's Bend, and in Westmoreland and Fayette counties ironstone is mined; and the charcoal furnaces of Armstrong, Butler, and Clarion cos. absorb large quantities of limonite. See IRON.

What is known as the Appalachian oil field comprises parts of Pennsylvania, New York, West Virginia, and Ohio. The entire field has over 7,000 wells, and the annual shipment since 1889 has averaged 33,000,000 barrels, the proportion of Pennsylvania being over one-half. The first well opened began its production on Aug. 30, 1859. The oil of P. is found in porous sandstones beneath strata 400 to 2200 ft. thick. See PETROLEUM.

Salt wells are worked in the valley of the Kiskiminetas or Conemaugh river on an extensive scale, and that industry is capable of vast development, as salt springs are not only very abundant in w. P., but exist in Susquehanna, Lycoming, Clearfield, and Bedford cos. The highest recent production was 280,343 barrels, in 1893.

ZOOLOGY.—Among wild animals are the deer, black bear, panther, lynx, wolf, red, and gray fox, raccoon, sable, pine marten, otter, mink, gray rabbit, opossum, porcupine, woodchuck, skunk, cat-squirrel, flying squirrel, ground squirrel, and stoat. The birds and wild-fowl are mainly such as are found in New York and New Jersey, and include the golden eagle, bald eagle, turkey buzzard, great horned owl, screech owl, fish hawk, heron, whippoorwill, night hawk, mocking-bird, cedar bird, logcock, swallow, and scarlet tanager. Among reptiles are the rattlesnake and black snake.

BOTANY.—The Alleghanies produce almost every species of timber except white oak. White pine, poplar, beech, sugar-maple, chestnut, and birch are most abundant. The first predominates chiefly on the eastern slopes of the mountains; wild cherry, walnut, hickory, and oak are frequent; chestnut predominates on the Chestnut ridge and Laurel hill region, which yields also red and rock oak. In the valleys and along the watercourses, hickory, ash, sugar-maple, cherry, elm, and sycamore of majestic growth flourish. Sugar-maple and beech fill the forest in the vicinity of lake Erie, hemlock in Clearfield, Cambria, etc., beech in the Lehigh region. Among the noticeable shrubs that adorn the woods with their blossoms are the rhododendron and laurel. Severe penalties are imposed for the wanton destruction of trees.

CLIMATE AND SOIL.—The climate of the state is different in its three natural divisions of eastern, western, and northern. The eastern section is marked by irregular alternations of the seasons; the mean extremities of notation for a great number of years being 5° below zero and 100° Fahr.; there are seldom more than 30 days of above 80° heat in summer and below 30° in winter. Sudden changes are of frequent occurrence—intensely hot or cold weather seldom lasts more than 3 days continuously. The period from the middle of Jan. to that of Feb. is generally the coldest, and from the beginning of July to

middle of Aug. the hottest. In the western section the fluctuations are more abrupt, and heat and cold more excessive. In the northern section and the mountainous regions of the entire state the winters are very severe, with an extreme temperature as low as 20° below zero; the summers delightfully cool. The climate is decidedly healthful, although malaria lingers in the river valleys, along canals, and in swampy regions.

The yearly mean temperature at Gettysburg is 50.63°; at Harrisburg, 53.73°; at Philadelphia, 52.1°; at Alleghany, 51.19°; the average annual rain-fall at Pittsburg is 37.09 ins., at Philadelphia, 44.05 ins. The soil is generally very fertile, especially in the central and western cos., being composed, to a great extent, of disintegrated limestone, and arable lands extend to the summits of the lower mountains. The lands in the n. are better for grazing than for agriculture.

AGRICULTURE.—Pennsylvania had, in 1890, 18,364,370 acres of farm land, valued at nearly $1,000,000,000, and with an annual product of $130,000,000. In the production of rye it ranks first among all the states of the Union, with over 4,500,000 bushels a year. Still greater crops are those of corn, oats, wheat, buckwheat, potatoes, and hay. The southeastern counties are rich in loam of great fertility, and the remoter valleys inland are remarkably productive. Chester is famous for its nurseries; and the dairy products of the state have immense value. In 1896 there were over 4,000,000 head of live stock (cattle, sheep, swine, and horses) in the state. Fruit trees of almost every species abound, and the grape is extensively cultivated. The culture of tobacco in Lancaster and other cos. is extensive and profitable, and Pennsylvania now ranks sixth among the tobacco-growing states with a crop of over 16,000,000 pounds per annum.

MANUFACTURES, ETC.—According to the census of 1890, the manufacturing interests of this state place it second as to the capital invested and the number of establishments; second also as to the value of products. The reports showed 39,336 establishments, $990,999,375 capital, 620,484 persons employed, $305,556,229 paid for wages, and $773,530,105 for materials, and $1,331,523,101 value of products. Besides the leading industries of coal, iron, and petroleum, the minor ones in which the state ranked first in the United States included paper bags, rag carpets, carpets other than rag, woolen goods of every description, glues, railroad cars, dentists' materials, drugs and chemicals, gunpowder, leather, dressed skins and tanned. In the amount of lumber produced, Pennsylvania is second only to Michigan. The lumber shipments from the two chief emporia at Williamsport and Lock Haven are enormous. In manufacturing iron, Pennsylvania leads all the states, and produces as much as all of them combined. The first blast-furnace in the state was opened by William Penn, on the Delaware river in 1688. The first forge went into operation at Coventry, in Chester co., in 1720. The first puddling and rolling mill was set up at Plumsock, Fayette co., in 1817. In 1895, Pennsylvania ranked fourth in the production of iron ore, the output being over 900,000 long tons, valued at nearly $1,000,000; and first in production of pig iron (nearly 5,000,000 long tons) and Bessemer steel (nearly 3,000,000 long tons). The coal regions of Pennsylvania are the richest in the world, and in 1895 yielded 56 per cent. of all the coal mined in the United States, or over 96,500,000 long tons. The anthracite mines are divided among seven districts, — Pittston, Wilkesbarre, Hazelton, Shenandoah, Ashland, Pottsville, and Scranton. The bituminous mines are divided among eight districts,—Monongahela City, Irwin, Mercer, Towanda, Connellsville, Johnstown, Idlewood, and Phillipsburg. Pennsylvania supplies the fastest ships of the North-German Lloyd, American, Cunard, Hamburg-American, and French lines with the picked coal on which they depend in their record-breaking trips. The largest quantity of coke is produced in the Connellsville region. Prosperous manufacturing centers are Philadelphia with 18,000 factories, 260,000 operatives, and an annual output worth $577,000,000; Pittsburg, which is one of the most important manufacturing cities in the world in brass, iron, steel, copper, glass, and paper, and with the natural-gas region about it; Reading, with its immense repair-shops and rolling-mills; Scranton, with steel-works and collieries; Harrisburg, manufacturing goods worth $10,500,000 a year; Lancaster, York, Easton, Chester famous for its shipbuilding, Allentown, Altoona, Erie, Meadville, New Castle, Norristown, Phœnixville, Bristol, Pottsville, Carbondale, Bradford, Titusville, Oil City, and Corry. See IRON; OIL-WELLS; PIPE-LINES; COAL.

COMMERCE. — Philadelphia and Erie are the ports of entry, and control a considerable amount of foreign commerce. Philadelphia has four lines of European steamers and numerous coast lines, thus making it one of the prominent ports on the Atlantic coast. The imports amount to over $39,000,000 annually, the domestic exports to over $42,000,000. Erie has one of the best harbors on Lake Erie, and carries on a large import trade in Michigan iron and Canadian lumber, and exports large quantities of coal. Pittsburg also, at the eastern head of navigation on the western rivers, has an immense inland trade, while its local ship-yards build large numbers of steamboats for use on the western rivers.

TRANSPORTATION. — The state ranks second in railroad mileage, the total length of lines operated being about 10,000 miles, exclusive of sidings. The various companies have a combined capital stock of over $560,000,000; funded debt, $578,000,000; and a total investment of $1,216,500,000; the cost of road and equipments was about $800,000,000; gross earnings, $150,000,000; net earnings, over $50,000,000. Interest payments on bonds aggregate over $25,000,000, and dividends on stocks, $15,500,000. Passenger traffic yields over $26,500,000, and freight traffic, $115,000,000. The principal road is the Pennsylvania, which, by lease, operates about 50 roads in all, capitalized at over $200,000,000, having a funded debt of $166,500,000, and covering nearly 2,700 miles.

Other important roads are the Philadelphia and Reading; the Lehigh Valley, the Pittsburg, Cincinnati, Chicago, and St. Louis; the Baltimore and Ohio, the New York, Lake Erie, and Western; the Philadelphia, Wilmington, and Baltimore; the New York, Susquehanna, and Western; the Delaware, Lackawanna, and Western; the Philadelphia, Reading, and New England; the Western New York and Pennsylvania; and the Pittsburg, Fort Wayne, and Chicago. The Pennsylvania, begun in 1847, from Philadelphia to Pittsburg, has some remarkable examples of engineering skill, and is also famous for its magnificent and impressive mountain scenery. The Philadelphia and Reading, besides a large passenger traffic, carries an enormous amount of freight, principally coal. The Erie crosses the Alleghany mountains in this state at an elevation of 2500 feet, which is the highest point crossed by any standard railway line east of the Rocky mountains. The Baltimore and Ohio have a widespread system in this state from Philadelphia on the east to Pittsburg and Johnstown on the west. The canal and slack-water navigation of the state, including the canals partly in New York and New Jersey, comprises about 725 miles, mostly owned or operated by railroad and coal-mining corporations. The operating canal and navigation companies are capitalized at nearly $60,000,000, and their canals and betterments have cost over $30,000,000. The state expended large sums in canal construction, but the rapid extension of the railroad system has caused many such water-ways to be abandoned.

Banks.—In 1896 there were 420 national banks in operation, with a combined capital of $74,805,820, deposits $240,539,135, and reserve $67,025,870; 83 state banks, with capital $8,415,050, deposits $40,086,517, and resources $57,022,931; 88 loan and trust companies, with capital $39,976,237, deposits $101,812,081, and resources $199,567,309; 16 mutual savings banks, with depositors 282,677, deposits $73,937,636, and resources $83,272,567; and 31 private banks, with capital $1,477,525, deposits $6,371,614, and resources $8,586,171. The exchanges at the clearing house at Philadelphia aggregated over $3,383,903,000, and at Pittsburg, over $773,000,000. The Bank of North America, founded in 1781, is still in active operation in Philadelphia. The First National Bank of Philadelphia is also historical as being the first bank in the U. S. chartered under the National Bank Act of 1862.

Churches, Education, etc.—In 1890 there were 10,175 church organizations, 9,624 church edifices, 780 halls used for religious purposes, 1,726,640 communicants, and church property valued at $85,917,370. The leading denominations numerically are the Roman Catholic, Methodist Episcopal, Presbyterian, Lutheran, Reformed church, Baptist, Protestant Episcopal, Evangelical Association, United Presbyterian, United Brethren, and Brethren (Dunkards).

The public school system is supervised by the superintendent of public instruction, appointed for four years, and by co. superintendents, elected for three years. The school population exceeds 1,625,000; the enrollment in public schools, 1,106,000; the average daily attendance, 780,000; the number of public school houses, 14,600; the estimated value of all public school property, $46,500,000; annual expenditure, $19,000,000. In many thinly settled sections, township authorities have closed small district schools and established large ones with city school grades in central localities, conveying distant pupils at the expense of their district. In the large cities public school affairs are managed by local superintendents and boards of education. Nearly $10,000,000 have been spent by the state in schools for soldiers' orphans. The Drexel Industrial Institute, opened at West Philadelphia in 1891, with an endowment of $1,500,000, provides free industrial day and evening classes for both boys and girls; it contains also a lecture-hall, library, and museum. A nautical school for the naval education of its boys is also provided by the state, and occupies the sloop of war *Saratoga*.

There are state normal schools at California, Clarion, East Stroudsburg, Edinboro, Indiana, Mansfield, Millersville, Shippensburg, Slippery Rock, and West Chester. There are numerous city and private normal schools, besides the normal departments in high schools and colleges, and special kindergarten training schools. The higher institutions include the following, of purely collegiate grade: University of Pennsylvania (non-sect). Philadelphia; Lehigh univ.; Haverford coll. (Friends), and Lafayette coll. (Presb.), Easton. The following have preparatory courses: Dickinson coll. (M. E.), Carlisle; Franklin and Marshall coll. (Ref.), Lancaster; Muhlenberg coll. (Luth.), Allentown; Pennsylvania coll. (Luth.), Gettysburg; Washington and Jefferson coll. (Presb.), Washington; Western univ. of Pennsylvania (non-sect.), Allegheny City; Bucknell univ. (Bap.), Lewisburg, and Swarthmore coll. (Friends), Swarthmore. St. Vincent's coll., Beatty; St. Francis college, and the college of the Holy Ghost, all Roman Catholic, have classical courses. The University of Pennsylvania and a few minor institutions have opened some of their courses to women, who have also several separate colleges and schools, prominent among which are Bryn Mawr college, the Ogontz school near Philadelphia, and Methodist and Presbyterian colleges at Pittsburg. There are many excellent schools and colls. for scientific and professional instruction, among others the Wharton school of finance, connected with the University of Pennsylvania, and the Pennsylvania state coll. The state maintains an agricultural coll. in Centre co., endowed with $500,000 and a farm of 300 acres. There are many theological schools; the University of Pennsylvania has departments of law, medicine, dentistry and veterinary medicine. The Jefferson medical coll., the Medico-Chirurgical coll., and the Woman's medical coll., all "regular," are in Philadelphia, as is the Hahnemann medical coll.

(homœopathic). Philadelphia has also dental colls., a college of pharmacy, and post-graduate medical schools; Pittsburg, a coll. of pharmacy. Special instruction in art is given at the Pennsylvania academy of fine arts, the Normal art school, the Woman's Industrial art school, the Spring Garden institute, and the School of Design for Women, Philadelphia. Excellent courses of practical instruction are given at Girard coll., Philadelphia. The Pennsylvania institution for the deaf and dumb, Philadelphia, includes a school of oral instruction. At Edgewood Park is the Western Pennsylvania institution for the deaf and dumb; at Scranton, an oral school for the deaf and dumb; at Philadelphia and Pittsburg, state institutions for the instruction of the blind; at Elwyn, a training school for feeble-minded children, and at Glenn Mills, Huntingdon, Morganza, and Philadelphia, are reform schools.

In 1896 there were 330 libraries of 1,000 volumes and upward each, with an aggregate of 2,964,761 volumes and 355,564 pamphlets. The library of Philadelphia, founded in 1731 by Benjamin Franklin and others, contains 188,600 volumes. There were, in 1896, 1422 publications in the state. The *North American*, founded in 1784, is still in successful operation. It is interesting to note here that the first paper mill in America was built within the present limits of Philadelphia in 1690; also the first type foundry was established in 1796.

Government, etc.—The capital is Harrisburg. The office of gov. or supreme executive was held from 1638 to 1681 by 13 individuals; from the accession of William Penn, 1681, to September, 1776, 26 administrations mark the proprietary government; from 1776 to 1791 6 persons held the office of pres. of the supreme executive council. The state government was organized in 1776. The convention, of which Benjamin Franklin was pres., signed the state constitution Sept. 28, 1776. In 1790 a new constitution, of a more democratic cast, was adopted, which has since undergone repeated alterations. The constitution, as amended in 1838, vested the legislative power in a general assembly, consisting of a senate and house of representatives; the latter, apportioned to the number of taxables, were elected annually, and limited to 100; the former elected for three years, one third annually; their number to be not less than one fourth or more than one third of the number of representatives. An amendment of the constitution, adopted in 1850, makes the judiciary elective, and limits the term of office to 10 and 15 years. Under the provision for amendments to the constitution, in 1864, the right of suffrage was granted to citizens absent in the military service of the state. An amended constitution was adopted in 1873, by a popular vote of 253,744 against 108,594, and went into force Jan. 1, 1874. It limits the senate to 50 members chosen for 4 years, and the house to a changing number, apportioned after each federal census (total 1897, 204), chosen for two years. Sessions biennial, without time limit. The gov. is empowered to convene extra sessions for urgent business, and required to do so in case of a vacancy in the office of a U. S. senator occurring during the recess. The executive department consists of a gov. (salary, $10,000), a lieut.-gov., both elected for four years, and a sec. of internal affairs (three years), an auditor-gen., elected for three years, and a treasurer, elected for two years; an attorney-gen, a sec. of the commonwealth, and a superintendent of public instruction, appointed by the gov., with the consent of two-thirds of the senators, for four years. The gov. is ineligible for two successive terms; he is empowered to commute sentences and grant pardons in their clearly defined limits, and vested, besides the ordinary veto powers, with the prerogative of a partial veto on appropriation bills. The official acts of the gov. are recorded by the sec. of the commonwealth. The department of the sec. of internal affairs embraces a bureau of industrial statistics, and maintains the supervision of corporations, charitable institutions, the agricultural, mining, mineral, timber, and other interests of the state. He must report annually to the general assembly. The judiciary embraces a supreme court, consisting of seven judges, with salary of $8000 each, elected by the people for 21 years, ineligible for re-election, with the judge the oldest in commission as chief-justice, and receiving $8500 salary; the court holds annual sessions at Philadelphia. Harrisburg, Sunbury, and Pittsburg, courts of common pleas, of oyer and terminer, and general jail delivery, of quarter sessions of the peace, magistrates' and orphans' courts. Judges of the supreme court, and those of the common pleas are justices of oyer and terminer and general jail delivery in the respective counties; the latter discharge also the functions of judge of quarter sessions of the peace and of orphans' courts in districts where special provision for them has not been made. Criminal matters of the respective districts belong likewise to their cognizance. There are 51 judicial districts in the state, in each of which the people elect one or more common pleas' judges for 10 years. See Philadelphia. The state contains likewise two districts for holding U. S. courts; for the e. district they are held in Philadelphia; for the w. at Pittsburg, Williamsport, and Erie. The right of suffrage is enjoyed by male citizens not under 21 years of age, who must have been citizens of the U. S. at least one month, residents of the state one year, and of the election district two months before election. The registration of voters is required in this state. New ballot laws based on the Australian system (q. v.) were adopted in 1891. The general election is held annually on the Tuesday next following the first Monday in November. The legal rate of interest is 6 per cent.; the penalty for usury, forfeiture of excess of interest. Married women may hold property separate from their husbands.

The electoral votes have been cast as follows: 1788, Washington 10, Adams 8, scattering 2; 1792, Washington 15, Adams 14, George Clinton 1; 1796, Adams 1, Jefferson 14, Pinckney 2, Burr 13; 1800, Jefferson 6, Adams 7, Burr 8, Pinckney 7;

1804, Jefferson and Clinton, 20; 1808, Madison and Clinton, 20; 1812, Madison and Gerry, 25; 1816, Monroe and Tompkins, 25; 1820, same; 1824, Jackson and Calhoun, 28; 1828, same; 1832, Jackson and Van Buren, 30; 1836, Van Buren and Johnson, 30; 1840, Harrison and Tyler, 30; 1844, Polk and Dallas, 26; 1848, Taylor and Fillmore, 26; 1852, Pierce and King, 27; 1856, Buchanan and Breckenridge, 27; 1860, Lincoln and Hamlin, 27; 1864, Lincoln and Johnson, 26; 1868, Grant and Colfax, 26; 1872, Grant and Wilson, 29; 1876, Hayes and Wheeler, 29; 1880, Garfield and Arthur, 29; 1884, Blaine and Logan, 30; 1888, Harrison and Morton, 30; 1892, Harrison and Reid, 32; 1896, McKinley and Hobart, 32.

PUBLIC CHARITIES are administered by a board of 10 members, appointed by the governor, and a general agent and secretary. The state institutions are the eastern and western penitentiaries, hospitals for the insane at Harrisburg, Danville, Morristown, Warren, and Dixmont; several reform schools; a soldiers' and sailors' home at Erie, and the hospital for miners at Ashland. Institutions not under state control, for the support and care of the defective and delinquent classes, in which state aid is extended to the indigent class, are numerous. There are similar institutions supported by endowments and private charity, receiving occasional state aid. Besides the penitentiaries, the state contains about 70 county jails, a workhouse and a house of correction for first offense prisoners. It numbers also about 60 almshouses, of which about 30 are county and 30 district institutions. The two distinctively reformatory institutions in the state are the House of Refuge, Philadelphia, and the Pennsylvania Reform School at Morganza. There are soldiers' orphans' schools at Chester Springs, Harford, and Uniontown. The Indian training school at Carlisle has met with great success. It was founded by the national government in 1879 to educate the young people of the Indian tribes. The students are chiefly Apaches, Cheyennes, Pueblos, Sioux, and Oneidas, with members of over thirty other tribes. A half day is devoted to the usual grammar school routine, and during the other half the boys are trained to work on farms or in the machine shops, while the girls are taught general housekeeping and economy. The National Guard has an authorized strength of nearly 11,000 officers and men, and an actual strength of over 8,000; and the annual appropriation for the militia exceeds $375,000. The state camp is at Mount Gretna, and division encampments have also been made at Gettysburg. The state arsenal is at Harrisburg, and contains mementos of the Revolutionary and Mexican wars. The naval reserve is composed of companies in Pittsburg and Philadelphia. The total available force of the state in time of war is 812,000.

FINANCES.—The last census report gives the state debt as $4,068,610; county debt, $7,841,484; municipal debt, $54,238,547; school district debt, $4,893,034; total net debt, $71,041,675; net state debt, 1896, $1,748,350.

POPULATION.—1790, 434,373; 1800, 602,365; 1820, 1,047,507; 1840, 1,724,033; 1860, 2,906,215; 1880, 4,282,738; rank of state: 2 in population, 2 in manufactures, and 5 in value agricultural products; population at census, 1890, 5,258,014. There are 67 cos.; for pop. 1890, see Census Tables, Vol. XV. The cities exceeding in population 20,000, in 1890, were Philadelphia, 1,046,964; Pittsburg, 238,617; Allegheny, 105,287; Scranton, 75,215; Reading, 58,661; Erie, 40,634; Harrisburg, 39,385; Wilkesbarre, 37,718; Lancaster, 32,011; Altoona, 30,337; Williamsport, 27,132; Allentown, 25,228; York, 20,793; Chester, 20,226. See histories by Proud (Philadelphia, 1797); and Cornell (New York, 1879); Watson's *Annals of Philadelphia and Pennsylvania* (Philadelphia, 1857).

PENNSYLVANIA DUTCH, the language of settlers of a considerable part of Pennsylvania, which is formed, not as might be supposed, by a blending of tongues of people of various nationalities meeting there, but which is the dialect of a people of south Germany, found near each other in that region, mainly Rhenish, Bavarians, Swiss, Alsacians, and Germans, to which is added a modicum of English words, taken often without alteration of form. The late H. Harbaugh, D.D., wrote a volume of fine poems, published in 1870, which exhibit the peculiarities of this dialect, as does also Haldemann's *Pennsylvania Dutch,* 1872.

PENNSYLVANIA, UNIVERSITY OF, in Philadelphia, was chartered in 1755 and is the sixth in the order of succession of American colleges. It is the outgrowth and successor of the college of Philadelphia, which was founded chiefly through the influence of Dr. Benjamin Franklin and Dr. William Smith. The latter was the first provost, and is conspicuous in history as having established in 1757 the curriculum of study which was adopted substantially by the colleges of later foundation. The medical department was established in 1765; that of law in 1789; the auxiliary faculty of medicine in 1865; the Towne scientific school in 1872; the dental school in 1878. The university embraces 12 departments: 1. The department of arts; 2. The Towne scientific school; 3 and 4. Two departments of medicine; 5. The department of law; 6. The school of music; 7. The school of dentistry; 8. The department of philosophy; 9. The department of veterinary medicine; 10. The Wharton school of finance; 11. The department of biology; 12. The department of physical culture. The University, occupying a large area in West Philadelphia, has separate and commodious buildings for many of its departments. The building for the departments of arts and for the Towne scientific school is one of the largest and most conveniently arranged college buildings in the country. The trustees have lately introduced into the official curriculum of medical study the methods which have long been used in European schools, and which, in all other departments of science, have given vitality and practical utility to the older didactic systems. The department of law has also been lately reorganized. The school of dentistry combines thorough practical instruction in mechanical and operative dentistry.

with such medical studies as are considered essential to the well educated dentist. Great additions have been recently made to the libraries of the university. Besides the old library of the university, and those libraries which are designed for the use of students in chemistry and engineering, there is the Colwell library, composed of a very complete collection of books relating to social and political science, which has been augmented by the bequest of the statistical and economical library of the late Henry C. Carey. The extensive and valuable classical library of the late Professor Allen has been presented to the university. A very choice collection of books, intended to illustrate the instruction in history and English literature, has also been added; and, lastly, a library selected with great care, and designed to aid in the study of the English language, and of the early English literature, has been procured. The extensive libraries of the literary and the scientific societies of the university are also open to their members. The design of the scientific school is to give a thorough technical and professional training to those who propose to engage in the following, among other pursuits, viz: in chemistry, with its manifold applications to the industrial arts; in metallurgy and assaying; in mineralogy, geology and mining; in civil, dynamical or mechanical, and mining engineering; in mechanical drawing and architecture; and in studies preparatory to medical study. The cabinets and apparatus are of the first order. The chemical department contains over 10,000 specimens of minerals, representing the most important forms and varieties of nearly every established species. The metallurgical and assay laboratories are furnished with the requisite furnaces, also with diagrams and models, representing many of the most important forms of furnaces and machinery, and a spectroscope, especially constructed for observations in the production of Bessemer steel. The geological department has a collection of American fossils (exclusive of the vertebrates), arranged chronologically, in two suites, the first lithological, the second paleontological, for the purpose of showing not only the characteristic genera and species, but their changes in relation to the sediments containing them. There are also suites of European fossils and collections of American coals and iron ores. In the department of physical engineering, the cabinet contains a very full collection of models, charts, and apparatus for fully illustrating the subject. The provisions for medical and surgical instruction and demonstration are very complete. The law department is thoroughly organized and effective. Number of professors, demonstrators, and instructors (1890), 174. Students—department of arts, 121; scientific, 254; music, 6; medicine, 469; law, 109; dentistry, 112; whole number, 1,022. Provost, William Pepper, M.D., LL.D.

PENNY, a British coin and money of account. After the Sceattæ (q.v.) it is the most ancient of the English coins, and was the only one generally current among the Anglo-Saxons. The name is evidently the same as the German *pfennig*, and both words seem to be intimately connected with the old German *pfant*, a pledge, and the Latin *pendo*, to weigh or to pay. Both in Britain and on the continent the word was anciently used for money in general, hence we have such phrases as "he has got his *penny-worth*," i.e., he has got value for his money, etc. The penny is first mentioned in the laws of Ina, king of the West Saxons, about the close of the 7th c. It was at this time a silver coin, and weighed about 22½ troy grains, being thus about $\frac{1}{240}$th of the Saxon pound weight. This relation to the pound weight is evidently derived from the usage of the early Franks, who retained the Roman division of the *libra* into 20 *solidi*, and the *solidus* into 12 *denarii* (the denarius being thus the 240th part of the libra or pound. See Mark. Half-pence and farthings were not coined in England till the time of Edward I., but the practice previously prevailed of so deeply indenting the penny with a cross mark that the coin could be easily broken into two or four parts as required. Silver farthings ceased to be coined under Edward VI., and silver half-pennies under the commonwealth. By this time the penny had steadily decreased in weight; it was 18 grains under Edward III., 15 and 12 under Edward IV., 8 under Edward VI., and under Elizabeth it was finally fixed at $7\frac{2}{31}$ grains, or $\frac{1}{62}$ of an ounce of silver, a value to which the subsequent copper pennies, which till 1860 were the circulating medium, closely approximated. In 1672 an authorized copper coinage was established, and half-pence and farthings were struck in copper. The penny was not introduced till 1797, and at the same period the coinage of twopenny pieces was begun; but these latter, being found unsuitable, were withdrawn. The penny of the present bronze coinage is of only about half the value of the old copper penny. The German *pfennig* was also originally a silver coin, bearing the same relation to the German pound of silver as the English penny to its pound. And in the 12th c. it was made so broad, in imitation of the Byzantine coins, that it would no longer bear to be struck with a die on each side as before, but was struck on one side only. In the beginning of the 14th c. the mark of silver was anew divided into 60 parts or coins, which, to distinguish them from the old coins, were called *grossi denarii*, whence the term *groschen*. In the modern money system of Germany, the pfennig is a nickel coin, the hundredth of the mark, the latter being equal to a shilling.

PENN YAN, village and co. seat of Yates co., N. Y.; on Lake Kueka and the Fall Brook and the Northern Central railroads; 43 miles n. of Elmira. It derives excellent power for manufacturing from the lake, is in a noted grape-growing region, and has large general agricultural and fruit interests. It was incorporated in 1833, and has regular steamboat communication with the head of the lake at Hammondsport, national

and state banks, public library, and academy, and several newspapers and churches. Pop. '90, 4,254.

PENNYPACKER, GALUSHA, b. Penn., 1844; on the breaking out of the civil war he enlisted as a private and rapidly rose in rank, becoming colonel in 1864, before which he had been engaged in Florida, and at Charleston harbor and Drury's bluffs, where he was three times wounded. He commanded a regiment at James river and the siege of Petersburg, and a brigade at Port Harrison and Fort Fisher, where he was again severely wounded and for his conduct was promoted brig.-gen. In 1866 he was made a col. in the regular army with the brevet of maj.-gen. His wounds compelled his retirement, 1883.

PENNYROY'AL, a species of mint (q.v.). The name pennyroyal is given in North America to a small plant, *Hedeosma pulegioides*, allied to the mints, and having, like them, a pleasant aromatic smell, and a warm pungent taste; which is much in use in domestic medicine, in the form of a warm infusion, to promote perspiration and as an emmenagogue.

PENNY WEDDINGS, or PENNY BRIDALS, was the name given to festive marriage ceremonials in Scotland, at which the invited guests made contributions in money (seldom more than 1s. each), to pay the general expenses, and leave over a small sum, which would assist the newly married pair in furnishing their dwelling. This practice, now disused, was prevalent in the 17th c.; and, as leading to "profane minstrelsing and promiscuous dancing," was denounced by an act of the general assembly of the Kirk, 1645, as well as by numerous acts of presbyteries and kirk sessions about the same period.

PENOB'SCOT, a river of Maine, rises near the center of the state by two branches, from a chain of lakes extending north-westerly; and after a s. by w. course of 135 m. from the junction, or 300 in all, empties into Penobscot bay, a broad and sheltered opening into the Atlantic ocean, 20 m. wide, with several large islands. Its chief towns are Belfast, at its mouth; Bangor, 50 m. above, where falls supply power to saw-mills and factories; Castine, and Bucksport. It is navigable to Bangor, where there is a tide of 20 ft. The chief trade is pine timber.

PENOBSCOT, a county in central Maine; drained by the Penobscot, Mattawamkeag, Kenduskeag, Piscataquis, and Leboois rivers; intersected by the Bangor and Aroostook, the Maine Central and Grand Trunk railroads; 3332 sq. m.; pop. '90, 72,865, chiefly of American birth. The surface is rugged and uneven, but fertile in the southern part. Lumber is the chief article of export, and between $4,000,000 and $5,000,000 worth are annually handled. Wool, potatoes, oats, hay, and dairy products are the staples. There are nearly 1000 manufactories, planing and saw mills, etc. Co. seat, Bangor.

PENOBSCOTS AND PASSAMAQUODDIES, Indians in Maine belonging to the Abenaqui branch of the Algonquins. In reward for their adherence to the colonial side in the revolution, Massachusetts ceded them a reservation on both banks of the Penobscot. The Passamaquoddies live along the Schoodic lakes and the w. shore of Passamaquoddy bay, and number about 500. The Penobscots, whose number is about the same, are mostly found on Indian island, opposite Oldtown. They elect a governor and lieutenant-governor. Both tribes belong to the Roman Catholic church.

PENRITH, a market t. of Cumberland, in a picturesque and fertile valley, with rich and striking scenery in the vicinity, stands on the Carlisle and Lancaster railway, 17 m. s.s.e. of Carlisle. In the parish churchyard is a monument of great antiquity, formed of two pyramidal stones about 12 ft. high, and known as the "Giant's Grave." The town contains an ancient free grammar-school, and other educational institutions. Pop. '91, 12,329.

PENRYN, a municipal and parliamentary borough and market t. of England, in the county of Cornwall, in a warm, sheltered, and richly productive valley, on the Plymouth and Falmouth railway, 2 m. w.n.w. of Falmouth. It stands on a low hill projecting eastward into Falmouth harbor. Trade is carried on to some extent with the mining district of Redruth, and there are several quarries in the vicinity, from which the famous Penryn granite—the material of which Waterloo Bridge, the Chatham docks, and a great number of other important public works are constructed—is obtained; 20,000 tons of granite have been exported in the year, but the quantity varies much. Pop. '91, of municipal borough, 4247. Together with Falmouth, it forms a parliamentary borough, which returns two members to parliament.

PENSACO'LA, city, port of entry, and co. seat Escambia co., Fla.; on Pensacola bay and the Louisville and Nashville and the Pensacola, Alabama, and Tennessee railroads; 7 miles from the gulf of Mexico. Its location made it an important point in early days, and its commodious, deep, and landlocked harbor led the U. S. government to establish a large navy yard there and to erect forts Barrancas, McRae, and Pickens for its protection. While in the possession of Spain the harbor was defended by San Miguel and San Bernardo fortresses. The city passed into the possession of the British in 1814 and into that of the United States in 1821. In the early part of 1861 the navy yard was surrendered to the state authorities, but the federal government recovered it in the following

year. The city has gas and electric lights, an abundance of good water, national banks, orphans' and widows' homes, daily and weekly newspapers, and about 10 churches. The principal industries are manufacturing and the shipment of lumber, coal, iron, cotton, and naval stores, the exports exceeding $6,000,000 per annum in value. Pop. '90, 11,750.

PENSIONARY, GRAND, OF HOLLAND. See GRAND PENSIONARY.

PENSIONS and PENSIONERS. The policy of the United States up to the year 1869 had been to confine the bestowment of pensions upon officers and privates who had served either in the army or navy during the earlier wars in which the country was engaged, or who had been wounded or otherwise disabled in active service during the more recent wars ; or to the widows, children, and other dependent relatives of the slain. The only exception to this rule had been in the case of a few private acts granting pensions to individuals for some public service or some act of signal heroism. But in that year a bill was passed which provided, among other things, that any judge of the U. S. courts who resigned his commission after 10 years' service, or longer, should continue during the remainder of his life to receive his full salary. Since that time pensions have been conferred on ex-presidents' widows (Mrs. Lincoln, Mrs. Garfield, Mrs. Polk, and Mrs. Tyler), on members of the life-saving department, on employés in the quartermaster's and pay-master's departments, etc. Military pensions may be said to date from the first year of the Revolution. In 1776 it was resolved that all officers who should continue in the service until the end of the war should receive half pay for 7 years after peace was established. In 1780 the provisions of this law were extended to the widows and orphans of those who died in the service. The half pay for 7 years was next extended to half pay for life, and subsequently commuted to full pay for 5 years. Between 1806 and 1818 the principle was established that all persons, whether officers or privates, who had been disabled in the course of either military or naval service should be provided for at the public expense. In 1818 pensions were granted to all the survivors of the Revolutionary war who for any reason stood in need of pecuniary assistance ; and subsequent legislation extended the provisions of the pension laws to other wars than the Revolution, so that they included military service wherever rendered. Since the civil war numerous acts have been passed for the relief of those who suffered, either directly or indirectly, while fighting for the union, and of the dependent relatives of the fallen. The provisions of the laws which determine the various classes of these beneficiaries, the amounts of their respective pensions, and the manner of making applications for the same, are too minute and intricate to be entered into here. A pamphlet containing the laws, with forms and instructions, is furnished free of charge by the commissioners of P. or the laws themselves may be found in the *U. S. Revised Statutes*, sections 4692–4791.

The recent growth of the pension list of the United States has been very great. In 1861 there were 8636 names upon the rolls receiving $1,072,461 annually. In 1865, 85,986 pensioners drew $8,525,153 ; in 1870, 198,686 persons drew $27,780,811 ; in 1875, 234,821 drew $29,683,116 ; in 1880, 250,802 drew $57,240,540 ; in 1885, 345,125 drew $65,693,706 ; in 1890, 537,944 persons drew $106,493,890. The disbursements in pensions for the year ending June 30th, 1891 was $124,415,951. This is $43,436,218 more than the cost of the entire military establishment of Germany for the same year. The total disbursements for pensions from 1861 to 1891 amounted to $1,158,712,303.36. In 1890, there were filed 105,044 applications for pensions, of which 66,637 were allowed. Of these 50,393 were made by surviving soldiers themselves, the rest by widows, etc. Some 1900 applications were on account of services in the Mexican War. In 1890, there were on the rolls the names of 23 widows of Revolutionary soldiers. There are 18 pension agencies in the United States, located at the following cities : Augusta (Me.), Boston, Buffalo, Chicago, Columbus (O.), Concord (N. H.), Des Moines, Detroit, Indianapolis, Knoxville (Tenn.), Louisville, Milwaukee, New York, Philadelphia, Pittsburgh, San Francisco, Topeka, Washington.

PENTADES'MA, a genus of trees of the natural order *guttiferæ*, to which belongs the BUTTER-AND-TALLOW TREE of Sierra Leone, *P. butyracea.* It is a tree 60 ft. high, and produces a conical fruit of the size of a very large pear, the pulp of which abounds in a yellow oily substance, with a strong flavor, somewhat resembling that of turpentine, yet much used by the natives as an article of food.

PENTAGON is a plane geometrical figure of five sides. When the sides are equal, the figure is called a regular pentagon.

PENTASTYLE, a building with a portico of five columns.

PENTATEUCH (Gr. fivefold book), a name given by Greek translators to the five books ascribed to Moses, which are in Hebrew called collectively *Torah* (law), by way of eminence, or *Chamisha Chumshe Torah* (five-fifths of the Torah). *Law* is also the general name by which the work or portions of it are referred to and quoted (the words "of Moses" or "of the Lord" being added occasionally) both in the Old and New Testament.

The division into five portions (further divided into 50, 40, 27, 36, 34 chapters, or 12, 11, 10, 10, 11 Parshioth or Sidras respectively, by the Masoretes) is, if not original, at

all events of a very remote date, and certainly anterior to the Septuagint. Genesis, Leviticus, and Deuteronomy, the first, third, and fifth books, form clearly defined and internally complete parts of the work as a whole, and thus, also, fix the limits of the intermediate second (Exodus) and the commencement of the concluding fifth (Deuteronomy). The chief aim of the Pentateuch being to give a description of the origin and history of the Hebrew people up to the conquest of Canaan, together with the theocracy founded among them, the center is formed by the person of Moses himself, the regenerator and lawgiver of the nation. Genesis, beginning with the history of the creation and antediluvian genealogy from Adam to Noah, in rapid outlines, sketches the propagation of the various tribes that descended from the one man who was saved in the deluge, but dwells with special emphasis upon Shem, from whom sprang, in the tenth generation, Abraham, the progenitor of the "people of the covenant." The salient events in the lives of his descendants, the patriarchs, are minutely described; and a fitting close is found in the benediction of Jacob, who, as it were, reinaugurates and confirms all his twelve sons in the covenant made between Abraham and God. Exodus, treating of the liberation of the people from Egypt; their wanderings in the desert; the promulgation of the law, by which they became emphatically the "holy nation" and the "people of the Lord;" and the erection of a visible sanctuary—may be regarded as the nucleus of the work; while Leviticus, the following book, fittingly enters into the details of the legislation and the mode of worship; especially the prescriptions concerning sacrifices, festivals, ceremonial purity, and the duties of the priests, with but little of history. The historical thread is taken up again in Numbers, the fourth book, which, also, side by side with the relation of the events between the Sinaitic period and the beginning of the fortieth year after the Exodus, contains many laws explanatory of, or complementary to, those of the former books, together with such as new circumstances had called into existence. A brief recapitulation of the preceding portions; Moses's most impressive and reiterated exhortations to keep that law, which was now completed and solemnly transmitted to the Levites; and the death of the legislator himself—form the chief contents of the fifth book, or Deuteronomy. Thus, the theocratic plan of the work is carried through from beginning to end, coming out more prominently in the three intermediate books, but never lost sight of entirely. Nothing is dwelt or even touched upon save that which in some way illustrates either the relation of God to the people, or of the people to God; the political, civil, and domestic laws themselves, being enumerated only as bearing upon the main aim and object of the work.

The special books being treated separately under their respective heads, we have here only to consider some questions relating to the work as a whole, and principally that of its authorship and history, as far as these points have not been touched upon already under Genesis. Tradition, as embodied in the earliest historical records, mentions Moses as the writer of the complete Pentateuch, such as it is before us: with the exception of a few verses, describing the last moments of the law-giver, etc., which were ascribed to Joshua. This tradition has for many a long century been almost universally adhered to. Not that there have not at different periods suspicions been raised respecting this "authenticity." The pseudo-Clementines, for instance, assumed that the law, orally delivered by Moses to the elders, had, before and after its being committed to writing, undergone innumerable changes, nay, corruptions; among these the too personal and human conceptions of God, and the unworthy traits recorded of the patriarchs. Jerome expresses himself in a somewhat doubtful manner on the relation of Ezra as the "redactor," or rather "restorer," of the Pentateuch. Aben Ezra boldly calls several passages later interpolations, and speaks of others still more poignantly as a *ssod*, or a "mystery," i.e., as containing difficulties not to be cleared away in consonance with the common belief, which he, however, was too pious wantonly to disturb. Other voices, vaguely lifted up by more or less competent scholars, remained unheard. It was not until long after the reformation, at the dawn of the exegetical and critical modern age, that the question whether this codex was the work of one man, or even of one age, and what share, if any, Moses had in its composition, began to be discussed seriously and on scientific grounds. Hobbes held that the Pentateuch was rather a work on, than by Moses. Spinoza came to the conclusion that it was to Ezra that we were indebted for the book in its present shape and that it embodies certain genuine portions, collected at a late period, together with a vast amount of later material, added at various periods subsequent to the time of the supposed author. Vitringa, Le Clerc (Clericus), Rich, Simon, and others, followed, resuming and enlarging the discussion chiefly respecting the difficulties which presented themselves in the accounts of the creation, and the like, contained in Genesis. The next, and indeed the most important step—because the one which at once removed the question from the field of hazy and timid speculations to that scientific basis upon which it still rests, was taken by Astruc, who, from the marked difference of the divine names used in Genesis and the beginning of Exodus—noticed in the Talmud and the Fathers of the Church—came to the conclusion that these books had been worked up from different original documents, which he called Jehovistic and Elohistic respectively. See article Genesis, where the development of this speculation is described. At the present stage of the investigation, the view very generally adopted is the "complementary theory," which assumes, with certainty, two or more authors—Jehovists and Elohists—for the whole of the first four books, at least; the fifth being by

some (Delitzsch, Schulz, Kurz, etc.) still ascribed chiefly to Moses's own hand. Only a small apologetic school, of which Hengstenberg long was spokesman, still upholds the entire integrity and authenticity of the work, pronouncing Moses its sole author. The contemporary discussions on these points, which, up to within a very recent period, were chiefly confined to Germany, have now also found their way into England. The impulse to the controversy in this country was principally given by Dr. Davidson, the "essayists and reviewers," and bishop Colenso, all of whom, on the basis of these German investigations, raised some new points. Innumerable replies, by more or less competent champions, have been issued; but as yet, so far from either of the combatants having declared themselves convinced by the arguments from the other side, the controversy elicits new publications uninterruptedly.

While endeavoring to trace, in the briefest of outlines, some of the chief objections raised against the Mosaic authorship and the replies given thereunto, we must remind the reader that ours is only the task of epitomizers, as it were, and that the very nature of our task precludes us from giving any opinion whatsoever about the superior force of the arguments on either side.

A work, alleged to be the production of one man, it is urged, first of all ought to contain neither unnecessary repetitions of considerable length, nor contradictions, nor anachronisms. There ought to be a plan and a unity. Yet, there can be no doubt, they say, about the fragmentary character of the Pentateuch. Many portions, evidently complete in themselves, are strung together without the slightest logical sequence, nay, in an unchronological order. As to repetitions and contradictions, there is, to begin with, the very history of the creation, which occurs twice in the first chapters of Genesis, is each time given differently, and in each account the divine name is consistently mentioned in a different way. The same is to be said with regard to the account of the deluge, and several incidents in the lives of the patriarchs; the important conversation between God and Moses respecting Aaron (Exod. iv. 10–16, and vi. 9); the descriptions of the tabernacle; the priestly vestments; the story of the manna as given in Exodus and Numbers; the account of the appointment of the council of the 70 elders in the same books; etc. Again, the work itself sometimes seems to indicate an author who is not the legislator himself, such as the phrase of Moses being the humblest of men; the account of his own death; the passage in Genesis "before there reigned any king over the children of Israel" (xxxvi. 31); the occurrence of the name of the city of Dan (Gen. xiv. 14, Deut. xxxiv.1), so called only after the conquest by that tribe. In Numb. xxxii. 34, again, we have an enumeration of a certain number of towns and villages built by the tribes of Gad and Reuben—an event which could not have happened during Moses's lifetime; further, the frequent occurrence of the formula "unto this day" (e.g., Deut. x. 8, where the author speaks of the institution of the Levites as being still in force "up to this day"), etc. It is contended, also, that the language of the Pentateuch varies very little from that of the last prophets, and that it can hardly be assumed that 1000 years should have made no perceptible difference in the idiom; more particularly has Deuteronomy been supposed to bear a striking resemblance, in style and language, to Jeremiah. The Pentateuch is further said to contain many facts palpably contradictory to natural laws, as they are established in the experience of the whole historical human race, and systematized by science.

Of the many ways to get rid of these and similar—old and new—exceptions, the most generally adopted is that which we mentioned as the method of "interpolation," by which the apologetic school strikes out some 50 or more passages, as not belonging to the original work, but having crept in, by way of commentary, note, or explanation, in post-Mosaic times—the body of the work being thus saved, so to say, by a most extensive amputation. As to the argument from the language, it is said that the Pentateuch, being *the* divine book, by way of eminence, and embodying the very phrases (to the letter) made use of by the Almighty, must needs have served as a model for the next 1000 years, and priests and Levites, the teachers of the people, were enjoined constantly to study and read it: hence the small difference in the later writers. Arabic and Syriac, it is argued, did likewise not change essentially for many centuries—an assertion, however, which only holds good if "many" is taken in a very vague sense indeed. That Deuteronomy differs in style and manner, is verbose, etc., is explained by Moses's advanced age. On the other hand, events which are not in harmony with the "natural laws" are accepted by the orthodox simply and literally as "miracles," while "conservative" rationalists of the school of Eichhorn, Rosenmüller, and others, who stand by the authenticity of the Pentateuch, have been at great pains to find some kind of poetical interpretation for them.

Some of the recent attacks on the authenticity are chiefly founded upon arithmetical grounds. The numbers of the people, their cattle, and the like, at various periods, do not seem to conform to the laws of natural increase, or even to the geometrical limits within which they were at times stated to have been confined. Among the direct proofs, however, proffered by the defenders of the authenticity, the following chiefly deserve attention. Deuteronomy, it is averred, can only be the work of Moses. He speaks in it to the men whom he has led for many years, as one who has lived through all the events himself. There is no possibility of any one imitating the local coloring in such a manner. If, then, Deuteronomy must be allowed to be the work of Moses, the three preced-

ing books, to the contents of which frequent allusion is made, must equally be supposed to be finally redacted, if not written, by the same hand; and it further follows naturally, that the introduction to these books, which is Genesis, must have emanated from it. Again, any one writing after Moses, could not possibly have possessed the extraordinarily correct knowledge of contemporary Egypt and Arabia, which appears throughout the Pentateuch. A writer who might be supposed to have acquired it by dint of study of antiquities, must, it is said, have betrayed himself on every page by inaccuracies and anachronisms. Nineveh is in Genesis a city of as yet little importance; while Resen, of which no trace is to be found in any other part of the Bible, is the great metropolis of Assyria of the time. Tyre, great in the days of David, and mentioned already in Joshua, is not to be met with in the Pentateuch, where a later writer would certainly have spoken of it in connection with Sidon. The Canaanite gods and altars are often spoken of; never their temples, of which yet we read in Joshua. Why, then, should that very ancient author, to whom must needs be traced the Pentateuch, not be Moses himself, rather than some contemporary of his? The fragmentary, abrupt, and, as it were, confused character of the work, the apologists further urge, so far from testifying against Moses, confirm the tradition of his authorship. Would not a later historian have worked the mixed mass of historical, geographical, legal, and personal material into a methodical and systematic whole? Who else could have imparted to the book the impress of a diary, so to say, but the man who was in the midst of the events, jotting down all the items important either in his own individual or the national career? And who but one standing in its very center could depict with such glowing colors the life that moved around him?—But a further direct argument for the authenticity is found by them in the very item of the language of the Pentateuch. True, they say, it resembles as much as can be that of the later books, because, as we said before, it remained the classical language for all later generations; but, on the other hand, it offers certain peculiarities—such as the use of a common pronoun of the third person singular for both the masculine and feminine genders; the same term for boy and girl; and the like archaisms—all of which distinctly prove it to be a work of a very much older date. The existence of an ancient Mosaic code of laws would further appear proved beyond any doubt by the constant recurrence of quotations from "the law of Jehovah" or "the law of Moses" throughout the other books of the Old Testament from Joshua to Hosea. Had there in reality been no such code in existence, the authors of the different biblical works could not possibly have so unanimously spoken of it without betraying a conscious forgery somewhere. That Ezra should have been the author, or, at all events, the refounder of the Pentateuch, is equally improbable, on account of the spirit, tone, language, and all those smaller peculiarities of which mention has been made; and he would, on the other hand, never have been able so skillfully to avoid his own individual manner and style, as it appears in his own book. The Samaritan Pentateuch, it is further said, which, with a very few characteristic alterations, is an accurate transcript of our Pentateuch, would have been an utter impossibility, considering the hostile relations between the Samaritans and the Jews, if it had not been well known as a genuine document before the division of the empire. That Hilkiah, who is said to have *found* the Book of the Law in the temple in the days of Josiah (2 Kings xxii.; 2 Chron. xxxiv.) should have been its real author—an opinion first advanced by De Wette—would imply a complicity in the forgery not only on the part of Jeremiah, Huldah, and the elders, but almost of the whole people, among whom, on the contrary, there certainly seems to have been living a very vivid tradition of the former existence of the book or some of its portions at least. Moreover, had it been first written in those days, there surely would have been introduced some kind of prophetical allusion to the royal house of David, or, at all events, a pedigree and origin differing from the incestuous one given in Gen. xxxviii. Deuteronomy would altogether have changed its language about royalty (xvii. 15–20) very considerably; and Joseph's would not have stood out so prominently as a favored tribe. The alleged difficulties respecting the numbers are explained away more or less convincingly—in the most difficult cases, by miraculous interference. Corruptions, interpolations, and the many fates that befall ancient documents, are allowed to have crept in, in some places; although this argument is given up by those who hold that a special providence watched over the divine work. In all other respects, they hold these books are exactly as they were written by Moses under direct "inspiration."—Thus far, in swiftest outlines, the pros and contras most commonly adduced, and worthy of some consideration.

A few rationalistic critics, however, have gone so far as to deny the very possibility of Moses having given the laws contained in the Pentateuch, chiefly founding their objections upon the ground that he was not likely to have been versed in the art of writing to an extent which the composition of these laws would presuppose. Egyptian characters, with which he might have been familiar, could not have been used for Hebrew composition; and the Hebrews themselves, uncultivated as they were, did not possess any characters of their own. There has only, in reply to these objections, that fact to be stated, that a soberer criticism of more recent date has found itself obliged, in deference to certain paleographical and other scientific truths, to give up most of these points, or, at all events, to found no such sweeping condemnation upon those which still remain. On the contrary, whichever of the hypotheses enumerated at the beginning is assumed, the groundwork of the legislation is traced back, by almost unanimous con-

sent, to the historical person of Moses, who is no longer the mythical demigod of barbarous hordes, but a man. The final redaction of these laws—of which many of later date are found to be wholly inconsistent with the earlier corresponding laws—as of the whole of the Pentateuch, is almost as unanimously placed in ages long after him.

In the contemporary "moderate" school in England, so far as we have been able to glean from their writings, the following seems to be the prevalent opinion on the point of the Mosaic authorship. It is allowed that Moses did not write the whole of the Pentateuch, but portions of Exodus, Leviticus, and Numbers, and the whole of Deuteronomy, with the exception of the account of his death, and such portions as palpably show an author who points to the imminent dissolution of the empire. That even the fundamental law (Decalogue) should be found in two varying versions, they hold, strengthens rather the assumption of their genuine Mosaic authorship in some original shape. The later editor, finding two different recensions made by contemporaries, or in subsequent ages, embodied them both, on account of their paramount importance, literally. Genesis was worked up from ancient documents, composed by various writers, living at various "prehistoric" periods, either by Moses himself, or under his supervision, by some of the elders. The first redaction of the five books as a whole took place after the conquest of Canaan, through Joshua and the elders; the second and final redaction, however, in which it received its present shape, is to be dated from the time of Ezra, after the return from exile.

The majority of continental modern critics of the more moderate stamp—who repudiate the notion of their belonging to the advanced rationalistic party—hold opinions of a very different kind; and since they have found professed partisans in England, the foremost of whom is Dr. Davidson, we will make use of his own words (*Introduction to the Old Testament*): "There is little external evidence for the Mosaic authorship; and what little there is, does not stand the test of criticism. The succeeding writers of the Old Testament do not confirm it. The venerable authority of Christ himself has no proper bearing on the question. The objections derived from internal structure are conclusive against the Mosaic authorship. Various contradictions are irreconcilable. The traces of a later date are convincing. The narratives of the Pentateuch are usually trustworthy, though partly mythical and legendary. The miracles recorded were the exaggerations of a later age. The voice of God cannot, without profanity, be said to have externally uttered all the precepts attributed to him. Moses's hand laid the foundation of the edifice of God's word, which has grown into the proportions in which we now possess it; but he was not the first writer who penned parts of the national legends and history. He was emphatically a *lawgiver*, not a historian, a grand spiritual *actor* in the life-drama of the Israelites, who founded their theocratic constitution under the direct guidance of the Supreme."

A few words must be added respecting the use of the Pentateuch. According to Deut. xxxi. 24 seqq., it was preserved in the ark of the covenant. Every seventh year it had to be read to the people in public; and probably the schools of prophets, instituted at the time of Samuel, propagated its use by copies. Moreover, certain priestly, sanitary, and other laws required constant reference to it, so that certain portions of it seem to have been widely in use at an early period. Every synagogue is, according to the tradititional law, to possess a roll of the torah, written on parchment, and under certain strictly-insisted-upon regulations, out of which roll certain portions are read on Sabbath and feast-days; and, according to the ancient custom in Palestine, when Monday and Thursday were the market-days—when the country-people came to town and the judges sat—also on those days. A smaller portion (parasha) is read on these and on the afternoon service of the Sabbath than on the Sabbath morning service, when a whole sidra is read, or rather chanted, accorded to the *Neginah*, which is note and accent at the same time. The Samaritans have, of all biblical books, only adopted the Pentateuch, with slight variations (see SAMARITAN PENTATEUCH), their book of Joshua being a very different work from ours; and certain very recent accounts of their possessing also other adaptations of our biblical books, require confirmation. For the different translations of the Pentateuch, ancient and modern, see BIBLE. The first printed edition of the Pentateuch dates Bologna, 1482, fol. The name of commentators and writers on the whole of the Pentateuch, both in and out of the church, is legion. We mention among the foremost, besides the church fathers (Augustine, Jerome, Ephraim, Syrus, etc.) and the mediæval Jewish commentators (Raspi, D. Kimchi, Aben Ezra), Calvin, Luther, Grotius, Père Simon, Le Clerc, Michaelis, Eichhorn, Jahn, De Wette, Keil, Hävernick, Bleek, Hengstenberg, Ranke, Kurtz, Stähelin, Ewald, Bertheau, Colenso, Graves, Stuart, Bush, etc.

PENTECOST (Gr. *pentecosté*, fiftieth) was the name given to the feast among the Jews, held on the fiftieth day after the passover, in celebration of the "ingathering," and in thanksgiving for the harvest. See FESTIVALS. From the Jewish use it was introduced into the Christian, and with special solemnity, as being the day of the descent of the Holy Ghost on the apostles, and of the first solemn preaching of the Christian religion. From early times, pentecost has been regarded as one of the great festivals of the Christian year, and it was chosen as one of the times for the solemn administration of baptism; and the English name of the festival, *Whit-Sunday*, is derived from the *white* robes in which the newly-baptized were clad. It is regarded as specially sacred to the Third

person of the blessed Trinity, to whose honor the services of the day are directly addressed. Many curious usages were anciently connected with the celebration. The dove, being held as an emblem of the Holy Ghost in some churches, a figure of a dove, suspended by a cord from the ceiling, was lowered so as to alight on the high altar during the service. In others, figures of cloven tongues, or red rose-leaves were similarly introduced. The latter practice is said to be still retained at Messina, but in general these scenical representations have been discontinued. In some places, however, in the east as well as in the west, the practice prevails of decorating the churches with evergreens and flowers, as is done in England at Christmas. The whole time intervening between easter and pentecost is celebrated in the Roman Catholic church with special solemnity, and with some peculiar usages, and of this something is retained in the church of England.

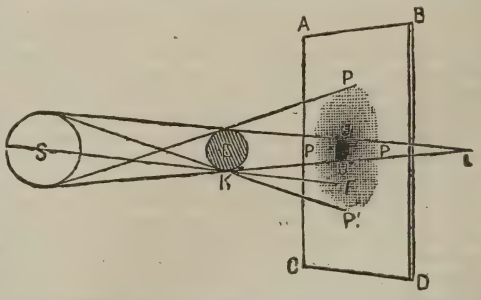
PENTHOUSE, a projection forming an open roof or shed, protecting a doorway, gate, window, etc.

PENTHIÉVRE, Pierre Philippe Jean Marie d'Orléans, Duc de, b. France, 1845 son of the prince de Joinville. He studied at Edinburgh, and in 1861 entered the U. S. naval academy. He was commissioned a midshipman in 1863, and a lieut. in 1864. Leaving the U. S. service for political causes, he entered that of Portugal, in which he remained 2 years. He is now an officer in the French navy.

PENTLAND FIRTH, a channel or strait between the Atlantic and German oceans separating the mainland of Scotland from the Orkney islands. It is 14 m. long, and from 6 to 8 m. wide. About a mile w. of Duncansby head is a ferry station, whence boats cross to Burwick, in the island of south Ronaldshay, a distance of 7 miles. The Pentland skerries, 5 m. n.e. of Duncansby head, consist of two islets, and of several contiguous rocks. On the larger of the islets is a light-house with two lights, one of which is visible for 19 m., and the other for 18 m. The lat. of the light-house is 58° 41′ n., long. 2° 55′ west. Off the coast of Caithness, and separated from it by a channel called the inner sound (about 2 m. in width), is the island of Stroma; and 3 m. n.n.e. of Stroma is the islet of Swona, one of the Orkneys. On the n. side of Stroma is the small vortex or whirlpool of Swalchie, and w. of it are the breakers called the "men of Mey," which are supposed to be produced by a current setting strongly on a concealed reef. The navigation of the Pentland firth is more dangerous than that of any other portion of the Scottish seas. A current setting from w. to e. flows through the firth with a velocity of from 6 to 10 m. an hour, and causes numerous eddies and whirlpools. It is estimated that about 4,000 vessels with cargoes pass through the firth annually.

PENTLAND HILLS, in the lowlands of Scotland, extend n.e. from the border of Lanarkshire to the center of the county of Edinburgh, and to within 4 m. of the city of that name. The mean height is upwards of 1000 ft.; the highest summit, Scold Law, in Edinburghshire, has an elevation of 1898 feet.

PENUM'BRA. When the shadow of an opaque object is thrown upon a surface at some little distance by a light of considerable apparent size, it is observed that the shadow is divided into two portions, a dark portion in the center, and a ligher portion surrounding it. The former is known as the *umbra,* or complete shadow; the latter as the *penumbra,* or partial shadow. A reference to the figure will at once make plain their origin and relation; for if S be the illuminating body, E the object whose shadow is cast on the surface, ABCD, it is seen that the small portion, *uu,* receives (omitting all consideration of refraction, dispersion, etc., of light) *no* light from S, while the whole surface outside of PPPP′ is completely illuminated. The point P′ receives light from the whole of S; the point F is only half illumined, and that by the lower part of S, the illumination of the points becoming less and less as they approach *u′*, which is unilluminated. The portion within *uu′* is the umbra, and that between the boundaries PPPP′ and *uu′* is the penumbra, which, as we have seen, gradually shades from perfect light at the outer boundary to perfect darkness at the inner, so that it is almost impossible exactly to note its limits on either side. This phenomenon, it is evident, can only occur when the illuminating body is of such a size, real or apparent, as to make the angle, P′K*u′*, of sensible magnitude; and it is equally evident that the nearer the body E approaches the plane on which its shadow is cast, the larger is the umbra and the smaller the penumbra; while by increasing the distance between E and the plane, so that the point L shall fall between them, the umbra is made to vanish, and the penumbra is increased. This is well illustrated by natural phenomena; the shadow of a man cast by the sun on the ground presents almost no penumbra; the shadow of the earth thrown by the sun upon space at the distance of the



moon gives a penumbra many times as large as the umbra; and sometimes, when the moon is new at her apogee, for instance, her shadow cast upon the earth exhibits no umbra. Spectators on the earth who see a partial eclipse of the sun, are situated within the penumbra, but within the umbra when they observe a total eclipse; while if the eclipse be annular, the umbra does not exist in the shadow cast by the moon on the earth's surface. See ECLIPSES.

PENZA, a central government of European Russia, between the government of Nijni-Novgorod on the n., and that of Tambov on the west. Area, 14,997 sq.m.; pop. '90, 1,596,500. The surface is in extensive and elevated plains, marked occasionally with ridges of low hills. The rivers are tributaries of the Don and Volga, and three of them, the Khoper, the Soura, and the Moksha, are navigable. The climate, though rather cold in winter, is temperate, agreeable, and healthy. The soil, consisting, for the most part, of black earth, is extremely fertile, and agriculture is the principal employment of the inhabitants. Grain of different kinds, leguminous plants, beet-root, flax, hemp, tobacco, and hops are the principal products. Much of the grain is used in the numerous distilleries, and considerable quantities of it are exported to the neighboring governments. About one-third of the entire area is covered with forests, some of which consist entirely of oak-trees. The manufactories are centred chiefly in the towns; cloth and leather are the principal articles made. The commercial improvement of the government is hindered by the want of direct means of communication with the consuming districts. The principal towns are Penza, Mokshansk, and Saransk.

PENZA, a t. of European Russia, capital of the government of the same name, on the Soura, 440 m. s.s.e. of Moscow. It was founded in the middle of the 17th c., as a defense against Tartar invasion, is a handsome town, occupying an elevation, and containing churches, convents, many gardens, a large park, with a beautiful fruit-garden and a horticultural school. It possesses cloth-factories, iron-works, tanneries, soap-boiling and candle-making establishments. The principal articles of commerce are corn and timber, which is floated down the Soura during spring. Pop. '97, 55,680.

PENZANCE, a market and sea-port t., and a municipal borough of England, in the co. of Cornwall, stands on the n.w. shore of Mount's bay, 65 m. w.s.w. of Launceston. It is the most westerly town in England—the light-house on its pier being in lat. 50° 7′ n., and in long. 5° 28′ west. The town standing on a finely-curved shore, surrounded by rocky eminences, and in a fertile district, is exceedingly picturesque in situation, and is famous for its mild, though somewhat moist climate. Its esplanade, one of the finest in the w. of England, commands charming land and sea views. The chief buildings, most of which are constructed of granite, are the town-hall and corn-market, surmounted by a dome, and the chapels of St. Paul and St. Mary. There are numerous boarding-houses for the accommodation of the visitors, attracted hither by the temperate and equable climate, by the beauty of the neighboring scenery, and the curiosities of the district of Land's End. Woolen yarns and cloths are manufactured; the fishery employs upwards of 2,000 persons; agricultural produce, pilchards, and tin and copper ores produced from the mines of the vicinity are exported; and timber, iron, hemp, and hides are the chief imports. A new floating dock was opened here in 1882. The Jay Gould Atlantic cable comes ashore at P. The harbor has two piers, docks and wet docks, and a light-house. Pop. '91, 12,400.

PE'ON. See CALOPHYLLUM.

PEON. A term used in Spanish America to denote an Indian or half-breed day laborer.

PEONY, *Pæonia*, a genus of plants of the natural order *ranunculaceæ;* having large flowers, with five persistent, unequal, leafy, and somewhat leathery sepals, 5 to 10 pedals, many stamens, and 2 to 5 germens, which are crowned with a fleshy recurved stigma. The leaves are compound, the leaflets often variously and irregularly divided. The fibers of the root are often thickened into tubers. The species are large herbaceous perennials, or rarely half-shrubby; natives of Europe, Asia, and the n.w. of America. None of them are truly indigenous in Britain, although one (*P. corallina*) has found admittance into the English flora. On account of the beauty of their flowers, some of them are much cultivated in gardens, particularly the COMMON PEONY (*P. officinalis*), a native of the mountain-woods of the s. of Europe, with carmine or blood-red flowers. A variety with double flowers is common.—The WHITE PEONY (*P. albiflora*) is another favorite species. It is a native of the central part of Asia. Its flowers are fragrant. —The TREE PEONY, CHINESE PEONY, or MOUTAN (*P. moutan*), is a half-shrubby plant, a native of China and Japan. In favorable circumstances, it attains a very large size, and a height of 12 ft. or more. It has been long cultivated in China and Japan; and is now also a favorite ornamental plan in the s. of Europe, and in the s. of England and Ireland; but the late spring-frosts of most parts of Britain are injurious to it; although it can bear severe frost in winter, when vegetation is at a stand. It flowers in spring. The varieties in cultivation are numerous. It is propagated by cuttings, and also by grafting. Its germens are surrounded by a cup-shaped laciniated membrane.—The roots of most of the peonies have a nauseous smell when fresh, and those of the common peony were in high repute among the ancients as an antispasmodic—hence

the name peony, from *paion*, a Greek name of Apollo, the god of medicine—but their medicinal properties are now utterly disregarded. The globose, shining black seeds of peonies were formerly, in some countries, strung into necklaces, and hung round the necks of children, as *anodyne necklaces* to facilitate dentition. The Durians and Mongolians use the root of *P. albiflora* in their soups, and grind the seeds to mix with their tea.

PEOPLE'S PALACE, The, opened in 1887 in East London, a section inhabited solely by the very poor, is also called Beaumont Institute. It owes its existence to the personal efforts of Sir Edmund Hay Currie, and a fund left in 1840, by John B. Beaumont, for the purpose of promoting the welfare of the poor in the neighborhood of Beaumont square. This formed the nucleus for Sir Edmund's collections, amounting to over $500,000. The Draper's Company, one of the city guilds, also extended substantial aid by a yearly subscription, for ten years, of $20,000, and an additional $100,000 for the building of the technical schools. Another fortunate incident, which largely aided the project, was the publication, just at the right time, of Mr. Walter Besant's *All Sorts and Conditions of Men*. The "People's Palace" took its name from the novel, and also many of its impossible (as was claimed) ideas. For the working plan of the whole, and the practical arrangement of details, the trustees relied very much upon the experience and advice of Mr. Quintin Hogg and Mr. Robert Mitchell, who were the pioneers in the Polytechnic Institute (q.v.). As the professed object of the "People's Palace" is to provide entertainment and instruction for the two millions of people in that benighted district, it is very fortunately situated in the Mile End road. "Queen's Hall," large, and handsomely decorated, was opened by the Queen, in person, on May 14, 1887. The real work was begun Oct. 3, in some old buildings, which were fitted up temporarily for class-rooms, work-shops, etc. In 1887–88, 3716 students joined the classes, and in 1889 still more. The technical school for boys is limited to 500, age thirteen, and is designed for the better class of artisans' sons. Adjoining the "Queen's Hall" is the library and reading-room, with separate entrance. 20,000 volumes, mostly donations, have already accumulated, and there is room for 250,000. The central front, with three stories, will be a great semi-circle, flanked by the schools on the east and the technical schools on the west. There will be social and refreshment rooms above, and on the uppermost floor will be located the art school. To the west of the building, communicating with the library and "Queen's Hall," a winter garden, enclosed in glass, filled with palms and flowers, and tropical fruits, will add to the attractions. The permanent gymnasium and swimming-baths will be located in a detached building. The interest which the miserably poor of this section have manifested in the various exhibitions of pictures, flower-shows, etc., concerts by military bands and orchestral societies, even at a penny admission fee, has roused the enthusiasm of the favored portion of the community, and contributions are liberal. During the first year 1,500,000 people attended—largely the very poor. See Besant, Walter.

PEOPLE'S PARTY. See Farmers' Alliance; Populist Party.

PEORIA, a co. in central Illinois, having Peoria lake and the Illinois river for its e. boundary; drained by Spoon river and Kickapoo creek; 615 sq. m.; pop. '90, 70,378, chiefly of American birth, with colored. It is intersected by the Chicago and Alton, the Chicago, Rock Island, and Pacific, the Rock Island and Peoria, the Peoria, Decatur, and Evansville, the Cleveland, Cincinnati, Chicago, and St. Louis, the Iowa Central, and several other railroads forming junctions at Peoria and Elmwood. Its surface is slightly rolling, a large proportion covered with oak, maple, ash, and elm trees, with large tracts of open prairie. It contains extensive deposits of limestone and bituminous coal. Its soil is very fertile, producing grain in large quantities, dairy products, and fruit. Large numbers of cattle, horses, sheep, and swine are raised. Much attention is paid to agriculture, the farming being done mostly by machinery. Its manufactures are important. Co. seat, Peoria.

PEORIA, city and co. seat of Peoria co., Ill.; on the Illinois river at the outlet of Peoria lake, and on the Burlington Route, the Chicago and Alton, the Chicago, Peoria, and St. Louis, the Chicago, Rock Island, and Pacific, the Cleveland, Cincinnati, Chicago, and St. Louis, and several other railroads; 165 miles s.w. of Chicago. It contains a public and the Peoria law libraries, high and graded ward schools, public school property valued at over $500,000, numerous denominational schools, two hospitals, over 50 churches, several national, state, and private banks, and electric light and street railroad plants. The city is noted for its manufactures, the principal of which are alcohol, high wines, whisky, corn-planters, wagons, buggies, threshers, boilers, glucose syrup, plows, and drills. The U. S. census of 1890 reported in Peoria 556 manufacturing establishments, employing $15,085,862 capital and 7,706 persons, paying $4,344,012 for wages and $9,996,379 for materials, and having an output valued at $55,535,023. The city is surrounded by a beautiful rolling country, is the site of a trading post established by La Salle about 1680, was settled in 1779, and received a city charter in 1845. There are elegant residences on the bluffs and attractive parks and driveways. Pop. '90, 41,024.

PEORIA INDIANS, a tribe formerly living in n. Illinois, transferred to Kansas in 1832, and to the Indian territory in 1867.

PEPÉ, GABRIELE, was b. in 1781 at Bojano, in the present province of Molise, Italy, and was a student of law in 1799, when, on the proclamation of the Parthenopean republic, he took service in the Franco-Neapolitan army, and was consequently exiled on the fall of the new government. Subsequently he served in the Italian legion in the French army under king Joseph in Spain with great distinction, and with Murat. In 1815 he was raised by the latter to the rank of col., a grade confirmed by Ferdinand I., who gave him the command of a province, and afterwards of the garrison of Syracuse. He espoused with great zeal the cause of the revolutionary party in 1820, and was deputed to the national parliament. On the downfall of the constitutional government he was seized by the Austrians, and imprisoned at Olmutz, in Moravia; but was released at the end of two years, and retired to Tuscany; where, feeling hurt at some remarks of M. de Lamartine, then *chargé-d'affaires* in that country, on Italian patriotism, he in turn wielded the pen in defense of his countrymen with such severity that a duel resulted between him and the poet, followed by an apology from the latter. From this time he took no part in political affairs, but devoted himself to science and literature, and died at Bajano, Aug., 1849.

PEPERI'NO, an Italian term, applied by some geologists to the brown volcanic tuffs derived from augitic rocks, to distinguish them from the ordinary tufas, which name they confine to the lighter-colored pumiceous rocks that have more trachyte in their composition.

PEP'IN, a co. in w. Wisconsin, having the Mississippi river for its s.w. boundary, separating it from Minnesota; 244 sq.m.; pop. in 1890, 69,032, chiefly of American birth. It is drained by the Chippewa river, flowing through it centrally, and lake Pepin, 28 m. long in the n.w. portion. Its surface is undulating, largely covered with groves of pine and sugar-maple, especially by the river banks, and in some sections are forests which supply an active lumber trade. It contains magnesian limestone, which rises into bluffs on the shores of the lake. Its soil produces every variety of grain; other products are honey, maple sugar, and the products of the dairy. Its manufactures include furniture, lumber, and wooden-ware. Co. seat, Durand.

PEP'IN, LAKE, an expansion of the Mississippi river, forming the boundary of Pierce and Pepin counties, Wis., on the n.e., and Goodhue and Wabasha counties, Minn., on the s.w. It is 27 m. long, extending from Red Wing s. to the mouth of the Chippewa river; its greatest width is 3 miles. The lake is surrounded by bluffs of limestone, rising some 400 ft., weather-beaten into the most fantastic shapes.

PEPIN, the name of several distinguished members of the Carlovingian family; the first of whom in order was PEPIN LE VIEUX or PEPIN DE LANDEN, the founder of the family. He was of a Brabant family, and took his designation from Landen (now in Liege, Belgium). Rebelling with others of the great lords of Austrasia against the rule of Brunehaut, who was regent for the youthful king, he offered the crown to Clotaire II., king of Neustria, who, in reward of his services, created Pepin *maire du palais* of Austrasia, an office which he continued to hold during the two following reigns, and died in 639. His administration was directed to the preservation of the power and integrity of the Austrasian kingdom, and though, by opposing the various schemes of centralization proposed by the king, he fell under the royal displeasure, his conduct gained for him favor and influence with the Austrasian chiefs; his power and wealth were greatly increased, and a broad and firm path to political supremacy laid for his descendants. His son, Grimoald, who succeeded him as *maire du palais*, incautiously attempted to gather the fruits of his father's schemes before they were quite ripe, and accordingly suffered for his folly. Both he and his son Childebert were strangled in prison (656) by order of Clovis II. Pepin "the Old" left by his daughter a grandson, PEPIN LE GROS or PEPIN D'HERISTAL, who was elected by the Austrasian nobility as their chief, to protect Austrasia against the machinations of Elroin, the able *maire* of Neustria. His first step was to rid himself of the Merovingian king, who nominally ruled over Austrasia; which was effected by obtaining the condemnation of the unfortunate monarch, Dagobert II., by a council of bishops, and then putting h t to death. From this time the Merovingian rule in Austrasia ceased. Pepin as now sole ruler, but his ambition did not stop here; he had resolved on the ruin of the Merovingian monarchs, and accordingly levied a large army for the vasion of Neustria. Elroin, on his side, was equally resolved to humble the territorial aristocracy, and support the throne; and advancing into Austrasia, his army came in sight of Pepin's at Loixi. In the battle (680) which ensued, Pepin's army was totally defeated, his brother and co-ruler, Martin, was taken prisoner and put to death, and he himself narrowly escaped. Luckily for him, however, Elroin was soon afterward assassinated, and his successor, Warato, signed a treaty of peace. The incapacity and tyranny of Warato and his successor, Berthaire, discontented the Neustrian nobles, who went over to Pepin, and by this accession of power enabled him to resume the offensive. Neustria was immediately invaded, and a bloody but decisive battle at Testry (687) freed Pepin of his opponent Berthaire, who was left dead on the field, and placed Neustria at his feet. Full of moderation in the midst of triumph, and satisfied that he could not place on the throne a more obedient slave than Thierry III., the then king of Neustria, Pepin caused him to be also proclaimed king of Austrasia, but reserved for himself the sovereign power, wielding the scepter though declining the crown. From this time he ruled the whole of France (Austrasia in his own right by his

election as duke, and Neustria as *maire du palais*) with energy, and undisturbed by any internal commotion, during the lives of three other "faineant" kings, till his death in 714. He had made several campaigns (689–708) against the Frisians, but that valiant and independent race was not thoroughly subdued for some time afterward. Pepin had two legitimate sons who died before him, and an illegitimate son, Charles, subsequently known as Charles Martel (q.v.), who succeeded to his power. The third who bore this name was PEPIN LE BREF, the younger son of Charles Martel, who, on the death of his father in 741, received Neustria and Burgundy; Austrasia, Thuringia, and Subia being the heritage of his elder brother Carloman. Aquitaine was nominally a part of Pepin's dominions, though, as it was really independent under its own duke, he made several attempts to subdue it; but the duke was quite able to hold his own against both Pepin on the one hand and the Arabs (from Spain) on the other. The farce of governing the country in the name and as the chief minister of the Merovingian sovereign was still kept up, though Pepin was eagerly longing for an opportunity to assume the crown; but the present time was inopportune, as no sooner was the restraint of Charles Martel's iron hand removed by death, than revolts broke out in all quarters among the Franks, Germans, Bavarians, and Gascons. The country by the united exertions of Pepin and Carloman, was restored to tranquillity about 745. Those princes who had excited the insurrection were mostly deposed, and otherwise punished, and the duke of Aquitaine was compelled to acknowledge at least the nominal sovereignty of Pepin. In 747 Carloman bade adieu to power, and retired into a convent, leaving his government to his sons, who were immediately dispossessed by Pepin. After crushing a rebellion of Saxons and Bavarians, Pepin began to carry out his favorite project of dispossessing the Merovingian dynasty of even the semblance of authority, and of originating in person a new royal dynasty. To gain his point he flattered the clergy, then the most influential body in France; and as they had been despoiled by Charles Martel for the behoof of his warriors, a moderate degree of kindness and generosity on the part of Pepin contrasted him so favorably with his father, that the clergy at once became his partisans. So did the pope, who felt the importance of securing the aid of the powerful Frankish chief against the Lombards, who were then masters of Italy, and released the Franks from their oath of fidelity to Childeric, the Merovingian monarch. On learning this Pepin at once caused himself to be elected king by the assembly of estates at Soissons, and was consecrated by the bishop of Mayence (Mar. 752). Childeric retired to a convent, where he died in 755. Pepin was the first Frankish monarch whose election received the sanction of the pope, and who was consecrated to his high dignity; and these solemn ceremonies put the crown to a great extent at the mercy of the clergy, who from this time took a political rank in the state. The practice, too, followed by Pepin and his predecessors in office, of gaining partisans by granting particular fiefs to various chiefs, greatly strengthened the feudal system, and proportionally weakened the royal power. This effect, however, did not show itself till after the subsequent reign of Charlemagne, on account of the personal genius of these two rulers. Pepin was soon called upon to aid the pope against the Lombards, and marching into Italy at the head of a large army, he compelled Astulf, the Lombard king, to retire from the siege of Rome, and restore several cities which had previously belonged to the Greeks; these were now handed over to the pope. He had hardly returned to France, when he was anew summoned (755) to Italy, the Lombards having broken their engagements. This time he took Ravenna, Emilia, the Pentapolis, and the duchy of Rome from the Lombards, reuniting them to the Holy See. After the settlement of affairs in Italy, the turbulent nations on his eastern frontier demanded his attention. The Saxons and other German tribes were defeated (757), their country cruelly ravaged, a heavy tribute exacted, and numbers of captives and hostages taken. Resolved to unite the whole of Gaul under his authority, he eagerly accepted the invitation of the Visigoths of Septimania to aid them against the Arabs, who had taken possession of the country; and after a war of many years' duration, Narbonne, the last of the Arab strongholds, was taken, and the country, freed of these invaders, at once acknowledged Pepin's authority. The remaining years of his reign were occupied in reducing the independent monarchy of Aquitaine, which was not accomplished till, after nine years (760–68) of desolating warfare, Pepin obtained the assassination of his opponent, duke Waifre, whose partisans then laid down their arms, surrendering to the Frankish monarch the vast provinces which stretch from the Loire to the ocean and the Pyrenees. Shortly after this conquest, Pepin died of dropsy, Sept. 768. He was a most active, enterprising, and in general fortunate prince; he established the unity of the Gallic nation, and protected it as far as could be done by invading and ravaging the territories of the neighboring nations, though he also introduced those elements of weakness into its constitution which reduced the authority of his successors to such a deplorable state. The others of this name, though important personages at the time, make little figure in history.

PEPOLI, CARLO, Count, b. Italy, 1801; educated at the university of Bologna. After the downfall, in 1831, of the revolutionary government of which he was a member, he was captured by the Austrians and imprisoned. Soon afterwards he was banished, and went to Paris, and later to London, where he gave a course of lectures on Italian history, and was professor of Italian literature in the university of London. He took

part in the revolution of 1848, was a deputy, and vice-president of the assembly, and, on the collapse of the revolutionary movement in 1849, returned to England, where he remained till 1859. While in Paris he wrote the libretto of Bellini's opera, *I Puritani*, and was author of a number of works in prose and verse. He d. 1866.

PEPPER, *Piper*, a genus of plants of the natural order *Piperaceæ* (q.v.), which once included the whole of that order; but, as now limited, consists of plants with woody stems, solitary spikes opposite to the leaves, and covered with flowers on all sides, the flowers mostly hermaphrodite. The most important species is COMMON PEPPER or BLACK PEPPER (*P. nigrum*), a native of the East Indies, now cultivated also in many tropical countries, and extensively in some parts of the new world; its fruit being the most common and largely used of all spices. It is a rambling and climbing shrub, with smooth and spongy stems, sometimes 12 ft. in length; and broadly ovate, acuminate, leathery leaves. The fruit is about the size of a pea, of a bright-red color when ripe, not crowded on the spike. In cultivation, the pepper plant is supported by poles, or by small trees planted for the purpose, as it loves a certain degree of shade, and different kinds of trees are often planted for this purpose in India. It is propagated by cuttings, comes into bearing in three or four years after it is planted, and yields two crops annually for about twelve years. When any of the "berries" of a spike begin to change from green to red, all are gathered, as when more fully ripe they are less pungent, besides being apt to drop off. They are spread on mats and separated from the spikes by rubbing with the hands or by threading with the feet, after which they are cleaned by winnowing. The *black pepper* of commerce consists of the berries thus dried, and become wrinkled and black; *white pepper* is the seed freed from the skin and fleshy part of the fruit, to effect which the dried fruit is soaked in water and then rubbed. White pepper thus prepared is of a whitish-gray color, but not unfrequently undergoes a bleaching by chlorine, which improves its appearance at the expense of its quality. Black pepper is much more pungent than white pepper, the essential constituents of the spice being more abundant in the outer parts of the fruit than in the seed. Pepper depends for its properties chiefly on an acrid resin and an acrid volatile oil; it contains also a crystalline substance called *piperin*.—The fruit of *piper trioicum*, a species very similiar to the common pepper, is more pungent; and it is cultivated in some parts of India.—The fruit of other species of *piperaceæ* is used as pepper in their native countries; that of *cocobryon capense* at the cape of Good Hope; that of *peltobryon longifolium*, of *artanthe crocata*, of *A. trichostachya*, and of *serronia jaborandi* in South America.—*Chavica Roxburghii* and *C. officinarum* yield the LONG PEPPER of druggists. They have woody climbing stems, solitary spikes opposite to the leaves, dicœcious flowers, and the fruits so close together on the spikes as in ripening to become a compact mass. The spikes are gathered when unripe, and dried in the sun. They are used in pickling and for culinary purposes, also in medicine for the same purposes as common pepper. They are generally reputed to be more pungent than common pepper. *C. Roxburghii* is cultivated in Bengal and the Circars, where it is called *pippul; C. officinarum* in the Dutch East Indian colonies. The root and thickest part of the stem of *C. Roxburghii* are extensively used in India as a stimulant medicine; and are cut into small pieces, dried, and brought to the market under the name of *pippula moola*.

Pepper acts on the skin as a rubefacient and vesicant, and is often used for this purpose in a powdered state, moistened with some kind of alcoholic spirit. It is also employed as a local stimulant in relaxation of the uvula, and is applied in the form of an ointment to ringworm. Taken into the stomach in small quantities it is a pleasant stimulant, but in large doses it produces great pain and irritation. The quantity used, however, by the natives of hot climates much exceeds anything known among Europeans, and the effects are evidently beneficial rather than injurious. The chief use of pepper is as a spice and condiment.

Pepper was known to the ancients; Hippocrates used it as a medicine; and Pliny expresses his surprise that it should have come into general use, considering its want of flavor. In the middle ages pepper was one of the most costly spices, and in the 13th c. a few pounds of it were reckoned a princely present. The quantity now imported into Europe is immense.

The name pepper is popularly given to substances possessing a pungency resembling that of pepper, although produced by very different plants. Thus, CAYENNE PEPPER is the produce of species of *capsicum*, of the natural order *solanaceæ;* JAMAICA PEPPER (or PIMENTO) of species of *Eugenia*, of the natural order *myrtaceæ;* and GUINEA PEPPER, or MELEGUETTA PEPPER, of species of the natural orders *scitamineæ* and *anonaceæ*. See CAPSICUM, PIMENTO, GRAINS OF PARADISE, and GUINEA PEPPER.

PEPPER, WILLIAM, b. 1843, an American physician, provost 1881–94 of the university of Pennsylvania, during which time the university made great progress. He has written many medical works and publications on sanitary matters.

PEPPERELL, Sir WILLIAM, 1696–1759; b. Maine; son of a Welsh emigrant. He was for many years a successful merchant; from 1727 until his death he was a member of the king's council for Massachusetts, and in 1730 was made chief-justice of the common pleas court. His title was bestowed upon him for his success as commander of the expedition which captured Louisburg in 1745. In 1748 he visited England and received

the grades of colonel, major-general, and lieutenant-general, in the British army. He was president of the Massachusetts council in 1755, and acted as governor of the province (1756–8). For many years he was a commissioner to treat with the Indians of New England, and in 1753 published *Conference with the Penobscot Tribe.* His life was written by Usher Parsons. Wm. P. Sparhawk, his grandson, took Sir William's name, succeeded to his great estates, and was made a baronet in 1774. The property was confiscated in 1778 on account of the owner's attachment to the British cause.

PEPPER GRASS, *Depidium Sativum.* See CRESS.

PEPPERIDGE. See BLACK GUM.

PEP'PERMINT. See MINT.

PEPPER-POT, a celebrated West Indian dish, of which casareep (q.v.) is a principal ingredient; and along with it flesh or dried fish, vegetables, chiefly the unripe pods of the ochro (see HIBISCUS), and chillies (see CAPSICUM).

PEPPER-ROOT, *Dentaria diphylla,* a perennial herbaceous plant, of the natural order *cruciferæ,* a native of North America, with pairs of ternate leaves, and racemes of white flowers; the root of which has a pungent mustard-like taste, and is used as a condiment.

PEPPER TREE. See SCHINUS.

PEPSIN has been already described (in the article DIGESTION) as one of the essential constituents of the gastric juice. Various modes of extracting it from the walls of the stomach of the calf, sheep, and pig have been proposed by different chemists (Wasmann, Frerichs, Schmidt, Boudault, and others), into which it is unnecessary to enter. According to Schmidt's analysis, it contains 53.0 per cent of carbon, 6.7 of hydrogen, 17.8 of nitrogen, and 22.5 of oxygen, and hence in its ultimate composition it is closely allied to albumen. This substance, either as a powder or in solution, has been employed of late years to a considerable extent in medical practice, in cases of disordered digestion from deficient or imperfect secretion of gastric juice, and of convalescence from typhoid and other debilitating fevers. Pepsin wine is perhaps the best form in which to prescribe this substance; a teaspoonful being the ordinary dose.

PEPTONES. See PROTEIDS, also DIGESTION.

PEPYS, SAMUEL, a distinguished officer of the admiralty during the reigns of Charles II. and James II., was b. Feb. 23, 1632–33. He was the son of a London citizen, a tailor, but was well educated, first at St. Paul's school, and afterwards at Magdalen college, Cambridge. His cousin, sir Edward Montague (the first earl of Sandwich), introduced him to public employment. In 1660 he was appointed clerk of the acts of the navy, and in 1673 secretary for the affairs of the navy. He was an excellent public servant, acute, diligent, and laborious; but during the fanatical excitement of the Popish plot he was committed to the tower, on an unfounded and absurd charge of aiding in the design to dethrone the king and extirpate the Protestant religion. Having been discharged without a trial, Pepys was replaced at his post in the admiralty, which he retained till the abdication of James II. For two years he held the honorable station of president of the royal society. He died May 26, 1703. Pepys wrote *Memoirs of the Royal Navy,* 1690. He left to Magdalen college his large collection of books, MSS., and prints, including about 2,000 ancient English ballads, forming five folio volumes. This curious collection was begun, he says, by Selden, and continued down to the year 1700, when the form peculiar to the old ballads, namely, the black letter with pictures, was laid aside for the simpler modern fashion. Pepys is now best remembered for his *diary,* deciphered by the Rev. J. Smith from the original short-hand MS. in the Pepysian library, Cambridge, and first published, under the editorial care of lord Braybrooke, in 1825. It commences on Jan. 1, 1659–60, and is continued for above nine years, when the diarist was obliged from defective eyesight to abandon his daily task. As a picture of the court and times of Charles II. this *diary* is invaluable; the events, characters, follies, vices, and peculiarities of the age are presented in true and lively colors, and the work altogether is one of the most racy, unique, and amusing books in the language. The fullest edition is that by H. B. Wheatley, which appeared in 1893.

PE'QUOTS, or PEQUODS, an Algonquin tribe of Indians, who were, probably, originally a part of the Hudson river Mohegans, but on the arrival of the English occupied a small tract of land in Rhode Island near the Niantic river. They were a very warlike race and constantly battling with the Narragansetts and other tribes. At first they were friendly to the whites, but soon became dissatisfied and hostile. Endicott and Gardiner led expeditions against them, and they retaliated by a massacre at Wethersfield. In 1673 Capt. John Mason led an expedition from Hartford against the Pequots, who were encamped at two forts near the site of Mystic. His force of 90 white men was joined by several hundred Mohegans under Uncas. The surprise was complete, the wigwams were fired, over 600 of the Pequots were killed, and as a tribe they ceased to exist. A small number carried on the fight from the swamps, but were before long slain or taken prisoners. Many were sold as slaves to the West Indies, others were scattered among different tribes, while Sassacus, the chief, was slain by the Mohawks to whom he had fled for refuge. Laws were made in 1655 for two bands of Pequots which had gathered at Ledyard and North Stonington. They were faithful allies in Philip's war and the

troubles with the French, but decreased rapidly in numbers. A few are still to be found in Wisconsin. An account of the Pequot war was written by Mason and published in Increase Mather's *Relation of Troubles by the Indians*, 1667.

PE'RA, a suburb of CONSTANTINOPLE (q.v.).

PERÆ'A (from *περαν, beyond*), a name given to a part of Palestine, e. of the river Jordan, anciently belonging to the tribes of Reuben and Gad. Josephus bounds it on the N. by Pella, E. by Philadelphia, S. by the castle of Machærus, and W., by the Jordan. It is naturally a fertile region, well watered by mountain torrents and springs. See GILEAD and BASHAN. It was the scene of a part of the ministries of John the Baptist and of Christ.

PERAK, one of the largest Malay states in the peninsula of Malacca, extends about 90 m. along the strait of Malacca, and some 45 m. inland. The soil is fertile, and for the most part covered with luxuriant vegetation. The mineral wealth is very great, and comprises abundance of tin, some gold and plumbago, and poor coal. Elephants, tigers, leopards, bears, and boars, and occasionally a rhinoceros, are found. Perak is thinly inhabited by various races, of whom the Malays are the most numerous. Some of the others are of the same stock as the inhabitants of Sumatra; there are wild hill-tribes in the interior. Cannibalism is still practiced by some of these races. Perak is governed by a sultan and petty chiefs, who have of late come under British influence, represented by a resident and his assistants. The murder of the British resident in 1875 has made the name of Perak more familiar to Englishmen. Pop. '91, 214,254. See maj. M'Nair's *Perak and the Malays* (1877).

PERAMBULATION OF PARISHES. The ancient custom in England of perambulating parishes in rogation week had a twofold object. It was designed to supplicate the divine blessing on the fruits of the earth; and to preserve in all classes of the community a correct knowledge of, and due respect for, the bounds of parochial and individual property. It appears to have been derived from a still older custom among the ancient Romans, called Terminalia, and Ambarvalia, which were festivals in honor of the god Terminus and the goddess Ceres. On its becoming a Christian custom the heathen rites and ceremonies were of course discarded, and those of Christianity substituted. It was appointed to be observed on one of the rogation (q.v.) days, which were the three days next before ascension day. Before the reformation parochial perambulations were conducted with great ceremony. The lord of the manor, with a large banner, priests in surplices and with crosses, and other persons with hand-bells, banners and staves, followed by most of the parishioners, walked in procession round the parish, stopping at crosses, forming crosses on the ground, "saying or singing gospels to the corn," and allowing "drinkings and good cheer" (Grindal's *Remains*, pp. 141, 241, and *Note;* Whitgift's works, iii. 266–267; Tindal's works, iii. 62, 234, Parker society's edition), which was remarkable, as the rogation days were appointed fasts. From the different practices observed on the occasion the custom received the various names of *processioning, rogationing, perambulating* and *ganging the boundaries;* and the week in which it was observed was called *rogation week; cross week,* because crosses were borne in the processions; and *grass week,* because the rogation days being fasts, vegetables formed the chief portion of diet.

At the reformation, the ceremonies and practices deemed objectionable were abolished, and only "the useful and harmless part of the custom retained." Yet its observance was considered so desirable, that a homily was prepared for the occasion; and injunctions were issued requiring that for "the perambulation of the circuits of parishes, the people should once in the year, at the time accustomed, with the rector, vicar, or curate, and the substantial men of the parish, walk about the parishes, as they were accustomed, and at their return to the church make their common prayer. And the curate, in their said common perambulations, was at certain convenient places to admonish the people to give thanks to God (while beholding of his benefits), and for the increase and abundance of his fruits upon the face of the earth, with the saying of the 103d Psalm. At which time also the said minister was required to inculcate these, or such like sentences, Cursed be he which translateth the bounds and doles of his neighbor; or such other order of prayers as should be lawfully appointed." (Burn's *Ecclesiastical Law*, vol. iii. 61).

To this day, questions of disputed boundary between parishes are invariably settled by the evidence afforded by these perambulations; for in such questions, immemorial custom is conclusive. And so far are they recognized in law, that the parishioners on such occasions are entitled to trespass on lands, and even to enter private houses if these stand on the boundary line. In Scotland, where the parochial principle has never been developed as in England, there seem to be few traces of a similar practice. But, as between neighboring landowners, a brieve of perambulation is the technical remedy for setting right a dispute as to boundaries or marches; and perambulating or "riding" the bounds or boroughs is a common practice.

The necessity or determination to perambulate along the old track often occasioned curious incidents. If a canal had been cut through the boundary of a parish, it was deemed necessary that some of the parishioners should pass through the water. Where a river formed part of the boundary line, the procession either passed along it in boats,

or some of the party stripped and swam along it, or boys were thrown into it at customary places. If a house had been erected on the boundary line, the procession claimed the right to pass through it. A house in Buckinghamshire, still existing, has an oven passing over the boundary line. It was customary in the perambulations to put a boy into this recess to preserve the integrity of the boundary line.

At various parts of the parish boundaries, two or three of the village boys were "bumped"—that is, a certain part of the person was swung against a stone wall, a tree, a post, or any other hard object which happened to be near the parish boundary. This, it will scarcely be doubted, was an effectual method of recording the boundaries in the memory of these *battering-rams*, and of those who witnessed this curious mode of registration.

The custom of perambulating parishes continued in some parts of the kingdom to a late period, but the religious portion of it was generally, if not universally, omitted. The custom has, however, of late years been revived in its integrity in many parishes.

PERAMELES. See BANDICOOT.

PER CAPITA, in law used technically to denote that kind of succession to the real or personal property of an intestate which is opposed to the succession by representation, or, as it is called, *per stirpes* (q.v.). Thus if A B leave three sons and three grandsons living at the time of his death and his property be divided into six equal parts, the next of kin are said to inherit *per capita*, i.e., by the head or poll. The statutes of each state determine whether, if the deceased were intestate, the succession shall be *per capita* or *per stirpes*. The latter method is the more common.

PERCEPTION. This word refers to our reception of knowledge through the senses, an operation that to the common understanding seems simple enough, but, viewed philosophically, is attended with much difficulty. Perception, considered as a source of knowledge, refers exclusively to the outer, or the object world—the world of extended matter and its properties. The names for the act of knowing one's own mind—the feelings and thoughts of the individual—are self-consciousness and self introspection. The word "consciousness," is sometimes improperly limited to this signification. Locke used the term "reflection" for the same meaning, but this is ambiguous and is now disused. All our knowledge is thus said (by those that deny innate ideas) to spring from two sources—perception and self-consciousness.

Two great disputes connect themselves with perception, both raised into their full prominence in the philosophical world by bishop Berkeley. The first is the origin of our judgments of the distances and real magnitudes of visible bodies. In opposition to the common opinion on this subject, Berkeley maintained that these were learned by experience, and not known by the mere act of vision. See VISION.

The second question relates to the grounds we have for asserting the existence of an external and material world, which, in the view of Berkeley, was bound up with the other. Inasmuch as perception is a mental act, and knowledge is something contained in a mind, what reason have we for believing in the existence of objects apart from our minds? or what is the mode of existence of the so-called external world.

The following sentences show in what manner Berkeley opened up the question: "That neither our thoughts, nor passions, nor ideas, formed by the imagination, exist without the mind, is what everybody will allow; and it seems no less evident that the various sensations or ideas imprinted on the sense, however blended or combined together (i.e., whatever objects they compose), cannot exist otherwise than in a mind perceiving them. I think an intuitive knowledge may be obtained of this by any one that shall attend to what is meant by the term *exist* when applied to sensible things. The table I write on, I say, exists—i.e., I see and feel it; and if I were out of my study, I should say it existed, meaning thereby that if I was in my study I might perceive it, or that some other spirit actually does perceive it. There was an odor—i.e., it was smelled; there was a sound—that is to say, it was heard; a color or figure, and it was perceived by sight or touch. This is all I can understand by these and the like expressions. For as to what is said of the absolute existence of unthinking things, without any relation to their being perceived, that seems perfectly unintelligible. Their *esse* is *percipi*, nor is it possible they should have any existence out of the minds or thinking things which perceive them."

This doctrine of Berkeley, amounting, it was said, to a denial of the existence of a material world (which is far from a correct view of it), was followed up by Hume, who, on similar reasoning, denied the existence of mind, and resolved the universe into a mere flow of ideas and impressions without any subject to be impressed, acknowledging nevertheless, that he felt himself unable, practically, to acquiesce in his own unanswerable arguments. There was obviously some great mistake in a mode of reasoning that brought about a dead-lock of this description; and hence it has been the work of *metaphysical* philosophy since that time to endeavor to put the perception of the world on an admissible footing.

Dr. Reid reclaimed against Berkeley and Hume by appealing to common sense, or unreasoning instinct, as a sufficient foundation for our belief in the existence of a world apart from our own minds. Sir W. Hamilton has expounded the same view with greater clearness and precision. He considers that our consciousness tells us at once that in the

act of perceiving there is both a *perceiving subject*—self, or the mind—and an *external reality*, in relation with sense, as the *object perceived.* "Of the existence of both these things," he says, "I am convinced; because I am conscious of knowing each of them, not mediately in something else, *as represented*, but immediately in itself, *as existing.* Of their mutual dependence I am no less convinced; because each is apprehended equally and at once, in the same indivisible energy, the one not preceding or determining, the other not following or determined; and because each is apprehended out of, and in direct contrast to the other."—*Reid*, p. 747.

Much as Hamilton has labored to elucidate this doctrine in all its bearings, it has not been universally accepted as satisfactory. Many believe that he has regarded as an ultimate fact of our constitution what admits of being still further resolved, and has mistaken an acquisition of the mature mind for a primitive or instinctive revelation.

Professor Ferrier, in his *Institutes of Metaphysic*, has gone through the question with extraordinary minuteness and elaboration. His main position is the inseparability of the subject and the object in perception (a position also maintained by Hamilton in the above extract) which is not reconcilable with the common assumption as to the independent existence of matter. Indeed, he reduces the received dogma of the existence of matter *per se* to a self-contradiction, and builds up a system in strict conformity with the correlation, or necessary connection, of the mind perceiving with the object perceived. He thus approaches nearer to Berkeley than to Hamilton or to Reid.

Those who would endeavor to show that our notion of the outer world is a complex fact, and an acquisition, and not a simple apprehension of the uneducated mind, explain themselves to the following effect. It is in the exercise of *force* that we have to look for the peculiar feeling of the externality of sensible things, or the distinction that we make between what impresses from without, and impressions not recognized as outward. Any impression that rouses a stroke of energy within us, and that varies exactly and constantly as that energy varies, we call an outward impression. Dr. Johnson refuted Berkeley, as he thought, by kicking a stone. But in fact it was his own action with its consequences, and not the optical impression of a stone in the eye, that satisfied him as to the existence of something outward. The sum total of all the occasions for putting forth active energy, or for conceiving this as possible to be put forth, is our external world.

We experience certain uniformly recurring sensations, and certain uniform changes in these, when we exert particular energies. Thus the visible picture of our dwelling is a permanent and habitual experience, and the variations of appearance that it is subject to correspond principally to our own conscious movements. As we move from one end of a room to another, we experience a change of the visible aspect at every step, and this regularly happens as often as we repeat the movement. But at times the appearance exists in another shape, to which we give the name of memory or *idea.* We draw a marked distinction between these two modes of presentation, the actual and the ideal, and we assign a superiority to the one over the other. The superiority we find connects itself with the relation to our own movements; a mere idea or mental picture remains the same whatever be our bodily position or bodily exertions; the sensation that we call the *actual* is entirely at the mercy of our movements, shifting in every possible way (but uniformly), according to the varieties of action that we go through. With a forward movement the visible impression enlarges, with a backward movement it diminishes. A certain movement of the eye shuts it out, another restores it. The raising of the head and the bending of the body are followed by an altered spectacle. We cannot but draw a broad distinction between the mental scenery that is thus shifted by all our movements, and the ideas and dreams that vary of themselves while we are still. To express the one fact, we use the terms externality, the material world, independent existence; to express the other we employ the opposite language, internality, the world of mind, etc. Even if sensation were only in ourselves, we should still have to distinguish between present sensation and remembered or revived sensation, the reference of the one to our voluntary movements, and of the other to no such modifying causes, would oblige us to note a vital difference in the two classes of facts. Such is the uniformity of connection between certain appearances and certain movements, that we come to anticipate the one through the other. We know that in some one position, as when lying in bed, certain movements of the limbs and back will bring us to the sensation of a solid contact in the feet; that another series of movements will bring on a particular view to the sight; that a third movement will give the sound of a bell in the ear, and so forth. We cannot avoid regarding those various sensible effects, brought uniformly into play by a regular series of waking voluntary actions, as totally different from our ideas, recollections, and dreams.

As our belief in the externality of the causes of our sensations means that certain actions of ours will bring the sensations into play, or modify them in a known manner, this belief is readily furnished by experience, and is no more than our experience entitles us to entertain. When we have been repeatedly conscious that a tree becomes larger and larger to the eye in connection with a definite locomotion on our part, called the forward advance; that this movement brings on at last a sensation of touch; that this sensation of touch varies with definite movements of the arms, and so on; the repetition of all this train of experience fixes it on the mind, so that from one thing alone, as from

the distant vision of the tree, we can anticipate, or as it is otherwise called, *perceive* all the other consequences. We then know, without going through the steps, that the specified movements will bring about all the sensations above described, and we know nothing else; this knowledge, however, is to us the recognition of external existence, the actual fact that is meant when a material world is spoken of. Belief in external reality is the sure anticipation of certain sensations on the performance of certain movements; everything else said to be implied in it is but a convenient hypothesis for aiding the mind in holding together those multifarious connections that our experience has established in the mind. In order to account for the fact that the conscious movement of elevating the upper eyelid is followed with the sensation of light, to us and to other minds, we suppose a luminous agency always existing even when not affecting us or any other person: we cannot know or verify this supposition—it is a generalization founded upon particular experiences, and serving to sum up those experiences in a convenient form, but no such perennial independent substance can be absolutely proved.

PERCEVAL, John, first Earl of Egmont, was born at Barton, England, in 1680. He deserves notice as one of the principal founders of the colony planted in Georgia in 1732. He was also the author of a number of minor works. He died in 1748. See Georgia.

PERCEVAL, Spencer, Right Hon., English minister, was the second son of John, earl of Egmont; born Nov. 1, 1762; educated at Harrow, and at Trinity college, Cambridge. He was called to the bar, and soon obtained a reputation as a diligent lawyer. A clever pamphlet on the abatement of the impeachment of Warren Hastings made him known to Pitt. Obtaining a seat in parliament for Northampton, he was soon conspicuous for his extreme horror of popery and his violent advocacy of what was called by his party the "Protestant interest." In the Addington administration he was made solicitor-general in 1801, and attorney-general in 1802. He was afterwards induced to abandon his profession and adopt a political career. In the Portland administration of 1807 he was made chancellor of the exchequer, and was even then the real head of the government, his influence with George III. being obtained by the depth of his bigotry and his pertinacious opposition to the Catholic claims. On the death of the duke of Portland, in 1809, Perceval became premier, uniting to his office of chancellor of the exchequer that of first lord of the treasury. He was retained in power by the prince of Wales on his accession to the regency. On May 11, 1812, about 5 P.M., as Perceval was entering the lobby of the house of commons, a man named Bellingham fired a pistol at him, the ball pierced his heart, and he instantly expired. The assassin made no attempt to escape. He was a Liverpool broker trading with Russia, who, having sustained some losses and injuries which he had vainly applied to the government to redress, determined to avenge himself by taking the life of the prime minister. Perceval's assassination shocked the public mind, and parliament hastened to make an ample provision for his widow and numerous family. His death was, however, rather a private than a public calamity. "With all my respect for the virtues and excellences of the late minister," said the marquis of Wellesley, who had held the office of foreign secretary in his administration, "I still feel it my duty to say that I did not consider him a fit man to lead the councils of this great empire." He was ready in debate, a placid and not ungraceful speaker, and led the house of commons with much tact; but he was superficial and intolerant. Sydney Smith, in his *Letters of Peter Plymley*, has conferred a species of immortality upon him by his wit and sarcasm. It was the fashion, when Perceval's public policy was attacked, to laud his domestic virtues. "Peter" said, if he had to choose between public and private virtues, he should prefer that Mr. Perceval "owed for the veal of the preceding year, whipped his boys, and saved his country."

PERCEVAL. *The Quest of the Graal* (q.v.) or *Cup*, one of the romances of the Knights of the Round Table, is generally supposed to have been written at a later period than the *History of the Holy Graal*, and to have been the result of compilations from the French and other sources; hence the statements concerning the reason of the Quest vary considerably. According to some traditions, St. Joseph of Arimathea was the ever-living possessor of the Graal; others say he died after several centuries had elapsed, having bestowed his authority and the precious relic on his son. Robert de Barron's history, written about 1160–70, and revised later in connection with Walter Map or Mapes (q.v.), tells us that Christianity was introduced into Britain during the first century of our era, by Joseph of Arimathea (q.v.), sometimes confounded with a bishop named Joseph, sent by St. Augustine from Africa to England, and sometimes with Joseph the centurion. He was allowed by Pilate to take down the body of Christ from the cross, and was given also the chalice or cup used by Christ at the Last Supper. This cup or graal (q.v.) had received the blood which flowed from His side on the cross, and was treasured by Joseph during his imprisonment for fifty years by the Jews, although one legend states that it was lost during a part of that time, and restored to him in his cell by Christ Himself. The apocryphal gospel of Nicodemus mentions this tradition. Joseph is said to have been preserved in life and health during his imprisonment by the possession of the Holy Graal, and to have been released by the Saviour in person, who taught him the words of the mass, and bade him celebrate daily the sacra-

ment of the Last Supper. Other authorities state that Vespasian (q.v.) heard of Christ, freed Joseph from prison, became a Christian, and reduced the Jews to slavery. After his release from prison, Joseph joined his brother-in-law Bron, le Roi Pêcheour, taking with him the graal and some other relics, and they formed a society for their preservation. Some of his adherents having sinned secretly, Joseph was told to make a test of righteousness and sin through the holy blood, by the voice of Jesus, which issued from the cup, and repeated His own words about Judas, "He who shall betray Me is eating and drinking with Me." The promise was also given that the place of the rejected Judas should be filled, but not until Bron's grandson (the third man of Joseph's lineage) should be fit to take it. Joseph did as he was directed, and some fish and the Graal, were spread upon the table. Those who could find place at the board were blessed with a feeling of satisfaction and were acknowledged to be righteous; those whose sins forbade them were recognized as the licentious, who had caused the distress among them. Alan, the son of Bron, after beholding the Holy Graal, and being taught by Joseph all things concerning it, departed with his kinsmen to the far West, to the isle of Avalon, or Avaron, preceded by Petrus, to whom was intrusted a letter which contained an account of the precious relics. Respecting the history of young *Perceval*, who is the hero of the *Quest*, we have also conflicting accounts. One is to the effect that he was an inexperienced youth, who knew nothing of his birth or destiny, nor of arms nor chivalry, but who had always lived in retirement with his mother. By his skill and courage he was advanced to knighthood, and finally reached the court of king Arthur (q.v.), where he was inspired to set out on the Quest of the Holy Graal. The story of Robert de Barron continues the history of Joseph's family from the time, when according to promise, Perceval, the son of Alan, grandson of Bron, le Roi Pêcheour (the brother-in-law of Joseph), and the third man of Joseph's lineage, was grown to manhood. He was predestined from his birth to be the one sufficiently pure to worthily guard the Holy Graal or Cup, and fill the vacant place of Judas at the table prepared by his grandfather Bron and Joseph of Arimathea at the command of Christ. But before this fact could be revealed to him, and he could be thus honored, he must prove himself to be the best knight in the world, spotless in soul and body. He joined the Knights of the Round Table and set forth upon the Quest with others, it being hidden from all that the Graal was still in the possession of Bron. Perceval after many adventures arrived at the secret place of the Graal, saw his grandfather, the lance, the broken sword, and the Graal, but without recognizing his locality or his grandfather. In a second attempt he was more successful, and Bron revealed himself, related the story, explained the sign of the lance which pierced the Saviour's side, and communicated everything which was reserved for the third of his lineage. Then the fisher-king died and all the enchantments of Britain passed away, leaving Perceval in possession of the Grail. In the version of Wolfram von Eschenbach, there was a similar story of a succession of Grail-kings, beginning with Titurel and ending with Partzifal; the scene was changed to Anjou and Spain, a book found in Toledo, with several Moorish and Catalan names was given as the authority for the history, and finally the Grail-kings and their people were mixed up with the Templars struggling against the heathens. It is upon Von Eschenbach's version that Wagner (q.v.) founded his opera of *Parzifal*. For continuation of *The Quest of the Grail*, see LANCELOT.

PERCH, *Perca*, a genus of acanthopterous fishes, of the family *percidæ*, to which it gives its name, and which includes many genera and a very great number of species both of marine and fresh-water fishes. The *percidæ*, or perch family, have the body somewhat oblong and more or less compressed; the scales rather large; the bones of the gill-covers toothed or otherwise armed; the mouth without barbels; the *vomer* toothed, and generally also the palate; there are sometimes two dorsals, sometimes only one. To this family belong not only the true perches, all of which are fresh-water fishes, but the lates of the Nile, the bass (q.v.) or sea-perch, and their congeners the pike perches, the *serrani*, and many other fishes. The true perches (*perca*) have two dorsal fins, distinct and separate, the rays of the first spinous and those of the second flexible; the tongue is smooth; and the gill-covers are bony, notched, and sharply serrated. The COMMON PERCH (*P. fluviatilis*) is an inhabitant of the lakes, ponds, and still rivers of almost all parts of Europe. It is very common in England and Ireland, and is found in many of the waters of the s. of Scotland, although in the n. it is rare, and is said to exist only where it has been introduced. But it is found in Scandinavia, and even in Lapland. It is of a greenish-brown color, passing into golden yellow on the under parts, and marked on the back with six or seven indistinct blackish cross-bands. Its height is about one-third of its length. It often attains a length of 16 or 18 in., and a weight of 2 or 3 lbs., but perches have been taken of 8 lbs. weight or more. The perch loves still waters, and is easily reared in ponds, but it is not a desirable inmate of ponds intended for other fish, because it is very voracious, and devours their fry. It is readily caught by almost any kind of bait, and sometimes takes a small artificial fly. It is much esteemed for the table. It lives a long time out of the water if kept moist, and in some countries is thus brought to market, and carried back to the pond if not sold. The female perch deposits her eggs in long strings, united by a viscid matter.—A species of

perch (*P. Italica*), found in the s. of Europe, differs from the common perch in its shorter and deeper form, and want of black bands.

PERCH. See ROD.

PERCHÉ, NAPOLEON JOSEPH, D.D., was born at Angers, France, in 1805, and entering the Catholic priesthood removed in 1837 to the United States. In 1870 he became Bishop of Abdera *in partibus*, and in the same year Archbishop of New Orleans. He died, Dec. 26, 1883.

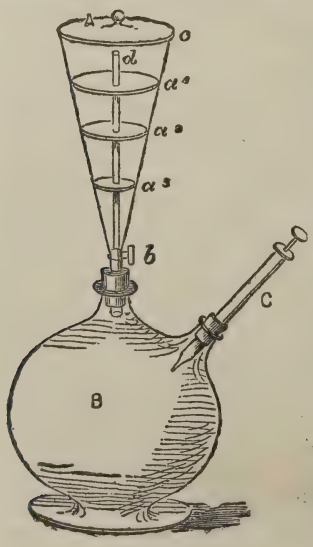
PERCHLO'RIC ACID, an energetic acid, and, when brought into contact with organic substances, exploding with great violence. It is, therefore, a dangerous substance to handle. It may be obtained by distilling potassium perchlorate with sulphuric acid. It is a colorless liquid, having a specific gravity of 1.782 at 60° Fahr., and does not freeze at — 31° Fahr. Formula, $HClO_4$. It soon becomes colored, even when kept in the dark, and after standing a few weeks decomposes with an explosion. Its vapor is transparent and colorless, and when brought in contact with moist air it forms dense white fumes. When the acid is cautiously mixed with a small quantity of water, a crystalline mass is formed, which is a monohydrate, $HClO_4 + H_2O$.

PER'CIVAL, JAMES GATES, 1795–1856; b. Conn.; graduated at Yale college, 1815, and in 1820 took a degree in medicine. He was appointed to the professorship of chemistry at West Point in 1824; in 1827 assisted Noah Webster in revising his dictionary; in 1835 was appointed assistant to Prof. Shepard in making a geological survey of Connecticut, a report of which he published in 1842; and in 1854 was made the state geologist of Wisconsin, which position he held at the time of his death. Though, as will be seen from this sketch, his scientific acquirements were considerable, his chief claim to remembrance is as a poet and literary man. His first book contained *Prometheus* and several lyric pieces (1821). *Clio* was a collection of prose and verse published in 1822 in 3 parts. Other of his poems were *The Mind; Dream of a Day and Other Poems* (1843); and many translations and minor works. A complete collection of his works was first published in Boston in 1859, with a biographical sketch by L. W. Fitch. He was very eccentric, yet a man of varied and extensive knowledge, acquainted with 10 languages, and familiar with both ancient and modern literature. His lyric poems were many of them very popular, and his other works, though now little read, are marked by a love of nature, a great variety of information, and remarkable metric skill. "One of his favorite plans was to imitate all known meters in all accessible languages, from the Sanskrit down." Although in straitened circumstances all his life, Percival collected a remarkable library. See *Life and Letters*, by Julius H. Ward (Boston, 1886).

PERCLOSE', a railing or other inclosure separating a tomb or chapel from the rest of a church.

PERCLOSE, or DEMI-GARTER, in heraldry, the lower half of a garter with the buckle.

PERCOLA'TION, a process much used in pharmacy, and in some other arts, for extracting certain soluble properties of various bodies by filtering a liquid through them.



Percolator.

In the new British pharmacopœia 39 tinctures and 9 extracts are ordered to be prepared by percolation. As the fluid soaks in and passes through the material acted upon, it displaces and carries with it the soluble parts, hence percolation is sometimes called the *method of displacement.* The forms of apparatus for percolation are very numerous, but the principle is the same in all—viz., a vessel with a porous bottom, and in the form of a truncated cone inverted, receives the material first, and over it is poured the water or other fluid which is to extract its virtues. One made by an eminent French pharmacien, M. Bejot, is very effective and complete. A is a long funnel-shaped glass, with a glass stop-cock (*b*) in the bottom, which narrows to an inch diameter; this fits into the neck of a large globular vessel B, both being adjusted by grinding. C is a syringe of brass fixed in the glass B as shown, and made air-tight by a caoutchouc washer. a^1, a^2, a^3 are three diaphragms of porous felt, pierced by the tube *d*, which allows air bubbles to escape from the bottom without disturbing the fluid. The material to be acted upon, as wood, bark, root, leaves, etc., is first powdered, and is then laid on the top of the uppermost diaphragm, a^1, so as to half fill the space between it and the glass-cover *c;* water, or any other required fluid, is then poured in until it is filled, the stop-cock *b* is opened, and the operator draws the air from the outer vessel by means of the air-pump C, the fluid is thus rapidly drawn through the material, and displaces its soluble parts. a^2 and a^3 arrest

the fine solid particles which are carried through the first diaphragm with the liquid, and form sediments which are also acted upon by the liquid which is checked at each division for a time. The fluid, when it reaches the globular glass, however dark colored, is beautifully bright and clear, and the preparations so made are remarkable for their good quality and uniformity of strength. In the year 1864 Dr. Redwood, of the pharmaceutical institution of Great Britain, invented a new percolator of great efficacy. It consists of a tinned copper cylinder, with a smaller cylinder of flannel inside, in which the materials are put. The whole is filled with the fluid menstruum, and as that which is in more immediate contact with the solid materials becomes charged with the soluble matter displaced, it gives rise, as its density is increased, to an endosmotic action through the flannel walls of the inner cylinder until the whole is equalized, when it is drawn off by the tap, and fresh fluid added until it comes away colorless. The outer cylinder has a tight cover to prevent loss by evaporation.

PERCOPSIDÆ, a family of fishes inhabiting the great lakes of North America, represented by only one genus, *percopsis*, of which there are several species, *P. pellucidus* being the most important. Their general form is trout-like, and they have been mistaken for young salmon. Scales comb-like, lateral line well defined and nearly straight, mouth small, with lateral cleft; margin of upper jaw formed by intermaxillary bones alone; no teeth on the palate; branchial openings large; branchiostegal rays six. There is one true dorsal fin, with branched rays, and an adipose fin as in *salmonidæ*.

PERCUSSION, in medicine, is the method of eliciting sounds by tapping, or gently striking the surface of the body; its object being to determine by the nature of the sound the comparative density of the subjacent parts. This means of diagnosis was first employed by Avenbrugger in the middle of last century, and it was afterwards adopted by Corvisart in the investigation of heart diseases; but its value was not fully appreciated till Laennec made the diseases of the chest his peculiar study; and since his time its application and various uses have been considerably extended by the labors of Piorry, Hughes Bennett, and other physicians.

Percussion is chiefly employed in the diagnosis of diseases of the lungs, heart, and abdominal organs. It may be *direct* (or, as some writers term it, *immediate*), or it may be *mediate*. In the former case, the part to be examined is struck with the ends of the three first fingers set close together on the same level, or with a small hammer tipped with India rubber; while in the latter, which is now almost universally adopted, a flat body is placed upon the chest, or other part to be examined, and is then struck by the fingers or hammer. The flat intervening body is termed a *pleximeter* (from the Gr. *plexis*, a blow, and *metron*, a measure). The instrument usually sold as a pleximeter is a flat oval piece of ivory, but the left index or middle finger of the physician, with its flat surface fitted accurately to the part to be examined, acts equally well. The force of the stroke on the pleximeter—whether the stroke be made with the fingers or the hammer—must vary according as it is desired to elicit the sound from a superficial or a deep-seated part. The surface to be percussed should be exposed, or, at most, only covered with one layer of clothing; and the blow should fall perpendicularly on the pleximeter. When percussion is made over a considerable cavity filled with air—as the stomach or intestines—a hollow, drum-like, or (as it is usually termed by medical writers) a *tympanitic* sound is produced. When any part of the surface of the chest is struck below which there is a considerable depth of healthy lung-tissue, consisting of small cells filled with air, a clear sound, less loud and hollow than the tympanitic sound, and termed the *pulmonary percussion note*, depending partly on the vibrations of air in the lung-cells, and partly on the vibrations of the walls of the chest, is evolved. When the subjacent substance is solid (as the heart, liver, or spleen) or fluid (as when there is effusion into a closed sac), the sound is *dull* in proportion to the density and want of elasticity of the part struck. The first thing that must be acquired, in order to make percussion useful in the diagnosis of disease, is an accurate knowledge of the sounds, elicited from the different parts in their normal condition. When, for example, the healthy pulmonary percussion note is known, increased resonance of the walls of the chest will indicate a dilatation of the air-cells (or pulmonary emphysema), while various degrees of dullness will afford evidence of such morbid changes as the effusion of fluid into the pleura (hydrothorax), or inflammatory solidification of the lung-tissue (the hepatization of pneumonia), or tubercular deposition. The use of percussion in relation to diagnosis is further shown in the articles PERICARDITIS and PLEURISY.

PERCUSSION, CENTER OF. See CENTER OF PERCUSSION.

PERCUSSION-CAPS are small copper cylinders, closed at one end, for conveniently holding the detonating powder which is exploded by the act of percussion in percussion-arms. Caps were not used with the earliest percussion-arms, which the Rev. Mr. Forsyth of Belhelvie, Aberdeenshire, patented in 1807; but they became tolerably general between 1820 and 1830, and were adopted for the army by 1840. With the adoption of breech-loading arms, the use of *separate* caps has been discontinued. Tha cap now forms a part of the cartridge, and at one operation is placed with it in the opened breech of the gun. The manufacture is extremely simple: A sheet of thin copper is stamped into pieces of appropriate shape, which are bent into the form of caps by stamping-apparatus closing round a mandril, the whole being done in one machine by two opera-

tions. The caps are then placed in a tray, mouths upward; and the inside of each is touched with a strongly adhesive varnish. Over this is dusted the detonating powder, all the particles which fail to adhere being blown, dusted, or shaken out. A stamper once more is forced into the cap, to fix and compress the powder, and the operation is completed.

For muskets, the caps are charged with equal parts of fulminating mercury and chlorate of potash; for cannon, with a mixture composed of two parts of chlorate of potash, two parts of native sulphuret of antimony, and one of powdered glass; the last ingredient taking no part in the chemical action, and being added merely to increase the friction. For the manner in which a cap is used. See Lock.

PERCY. This is the name of a noble Norman family who accompanied the conqueror to England, and whose head, William de Percy, obtained from his sovereign thirty knight's fees in the n. of England. The representation of the house devolved (temp. Henry I.) on Agnes, daughter of the 3d baron, who married Josceline of Lovain, brother-in-law of the king, only on condition that he adopted either the surname or the arms of Percy; he chose to retain his paternal arms and to assume the Percy name. The head of the family at the time was one of the chief barons who extorted Magna Charta from king John; and the 9th feudal lord (temp. Edward I.) showed a similar spirit towards the pope, against whose demands he maintained, with others of the greater barons, the spiritual independence of the English crown. This nobleman's great-grandson was a distinguished military commander under Edward III., and, acting as marshal of England at the coronation of Richard II., was created earl of Northumberland. He subsequently, however, took up arms against Richard, and placed the crown on the head of Henry of Lancaster, who became Henry IV. Again dissatisfied with the government, he joined in rebellion with his son Hotspur, for the purpose of transferring the crown to Mortimer, earl of March. The earl, with the other leaders of this rebellion, fell at Bramham Moor (1407–08), and his titles became forfeited. These, however, were revived in favor of his grandson, who became lord high constable of England, and who was killed at the battle of St. Alban's. This earl's son and successor (the third earl) met a like fate on Towton field, fighting in the van of the Lancastrian army. The 4th earl (who obtained a reversal of his father's attainder) was murdered by the populace in Northumberland, when ordered by the avarice of Henry VII. to enforce a subsidy. The executions of the 6th and 7th earls by Edward VI. and Elizabeth are part of the history of England. The 8th earl was committed to the tower, on a charge of being concerned in a plot in favor of Mary queen of Scots, and died a violent death in prison. The 10th earl fought in the civil wars against Charles I., though he took no part with the regicides, and eventually joined in the general effort to bring about the restoration. The 11th earl left an only child, who succeeded to the ancient barony of Percy, and marrying Charles, duke of Somerset, became the mother of Algernon, duke of Somerset, who was created earl of Northumberland, with remainder to his son-in-law, sir Hugh Smithson, of Stanwick, in the county of York, a gentleman of respectable lineage. Sir Hugh, succeeding to the earldom, obtained in 1766 his advancement to the dukedom of Northumberland, which title is now held by Algernon-George Percy, born in 1810, who succeeded to the dukedom in 1867.

PERCY, Thomas, d.d., an eminent poetical collector, antiquary, and scholar, was b. at Bridgenorth, Shropshire, in 1728; was educated at Christchurch, Oxford; and having entered the church, rose to be bishop of Dromore, in Ireland, 1782. He died in 1811. This amiable and accomplished prelate, the friend of Johnson, Goldsmith, and other distinguished contemporaries, published translations from the Icelandic, a new version of the *Song of Solomon*, the *Northumberland Household Book*, a translation of Mallet's *Northern Antiquities*, etc. His most popular and valuable contribution to our literature was the *Reliques of Ancient English Poetry*, consisting of old heroic ballads and songs, with some modern imitations, in which the editor himself displayed the taste and feeling of a poet. This work appeared in 1765, and Percy lived to see four editions of it called for by the public, and to receive the warm commendations of all poetical readers and critics. The *Reliques* were chiefly obtained from an old folio MS. that had fallen into Percy's hands, with the addition of pieces from the Pepys collection at Cambridge, the Ashmole library at Oxford, the British museum, and the works of our earlier poets. Certain liberties were taken with some of the ballads—softening touches, repairs, and renovations—for which the editor was severely censured by Ritson and other antiquaries; but the collection was of great value to English literature, recalling public taste to the rude energy, picturesqueness, and passion of the old chivalrous minstrels and Elizabethan songsters. It captivated the youthful imagination of Walter Scott, and was the inspirer and model of his *Minstrelsy of the Scottish Border*. The memory of Percy has been still further perpetuated by a club book association, called the Percy Society. See Club.

PERDIC'CAS, son of Orontes; a general of Alexander the Great. He commanded a division of the phalanx at the most important victories of Alexander; at Susa was given a crown of gold and the hand of the Median satrap's daughter, and at the great conqueror's death-bed received from him his signet-ring, and therefore claimed the protectorship of the empire. When Aridæus, the natural son of Philip, was recognized as king,

Perdiccas became the general of the household troops and gained full control of the government. He joined the party of Roxana, one of Alexander's wives, and put to death Statira, the other. A confederation against the power of Perdiccas was entered into by Antigonus, Antipater, and Ptolemy, and in B.C. 321 he was assassinated near Memphis by his own soldiers.

PERDI'DO, a bay and river of Alabama. The bay, 20 m. long by 6 to 10 m. wide, opens by a narrow channel into the gulf of Mexico, 18 m. w. of the entrance to Pensacola bay; the river rises in s.w. Alabama, and bay and river form the boundary between Alabama and Florida.

PERE DUCHESNE. See HÉBERT, JACQUES RENÉ.

PER'EGRINE FALCON, *Falco peregrinus*, a species of falcon (q.v.) found in almost all parts of the world. The female is larger than the male, being about 18 in. in length from the tip of the bill to the tip of the tail, whilst the male is only about 15 inches. The female is the *falcon* of falconers, and the male the *tercel*. The plumage of the two sexes is very similar. The back, wings, and tail are bluish-slate or ash-gray, the feathers barred with a darker tint; the crown of the head, back of the neck, and a spot below the eye, nearly black; the front of the neck white, with dark longitudinal lines; the breast, belly, and plumage of the legs, whitish, with dark-brown transverse bars. The wings are very long, reaching almost to the tip of the tail; and the bird is remarkable for its power of flight, being capable of maintaining for a considerable time a rate of more than 100 miles an hour, so that it is often seen far from any of its haunts or breeding-places; whence the name peregrine, from the Latin *peregrinus*, a wanderer. Its swoop, when rushing on its quarry, is wonderful both for rapidity and force. The peregrine falcon can easily carry through the air a bird or quadruped fully its own weight. Its ordinary prey consists of grouse, woodcocks, rabbits, etc. The woodcock in vain seeks to escape from it by threading its way among branches of trees and brushwood; the falcon follows, and exhibits at least an equal power of moving with great rapidity in the thicket without getting entangled or stayed. Sometimes the quarry soars into the air, and seeks safety by trying to keep above the falcon, till both are lost to ordinary sight; but the falcon generally gets uppermost, and "strikes" it at last. Owing to the quantity of game the peregrine falcon will capture—it is said that a single nest will consume nearly 300 brace of grouse in a season, besides other prey—it is ruthlessly trapped or otherwise destroyed, so that this beautiful bird is in danger, like others of its family, of being exterminated. The peregrine falcon is a bird as remarkable for boldness as for power of flight. It has sometimes been seen to pounce on game shot by a sportsman, before it could fall to the ground; and an instance occurred in Yorkshire of a peregrine falcon dashing through the glass of an aviary in a town, and carrying off a bird. It makes its nest on ledges of high rocks, either on the sea coast or in inland precipices and ravines, and lays from two to four eggs. Numerous localities in Britain have long been noted as breeding-places of the peregrine falcon, and some of them are regularly visited for the young birds, which are still trained in certain places for the sport of falconry. The bird, caught when adult, although more difficult to train, is, however, believed to possess superior qualities. The peregrine falcon is more docile, and becomes more gentle than the gyr-falcon. The young female of the peregrine falcon has been by mistake described by Pennant and others under the name of the lanner, a species not found in Britain.

PEREIRA, JONATHAN, the pharmacologist, was b. in the parish of Shoreditch, London, May 22, 1804. After a distinguished career at a classical academy in Finsbury, where he remained for four years, he devoted himself to the study of medicine, and in 1823 was appointed resident medical officer of the general dispensary in Aldersgate street, at which institution he became, three years afterward, lecturer on chemistry. His attention was early attracted to the study in which he has become famous. In 1824, he published a translation of the *London Pharmacopœia;* which was followed by *A Manual for the Use of Students; A General Table of Atomic Numbers, with an Introduction to the Atomic Theory;* and other text-books for the use of those who were preparing for medical examinations. He contributed numerous papers to the professional journals on the properties and adulteration of drugs, and laid the foundation of those researches which issued in his great work on *Materia Medica*. In 1832 he resigned the office of lecturer for that of professor of materia medica in the new medical school in Aldersgate street, and at the same time he succeeded Dr. Gordon as lecturer on chemistry at the London hospital. His *Elements of Materia Medica* (first published in the form of lectures contributed to the *Medical Times and Gazette*) appeared as a separate work in 1839–40, and at once established his reputation as a pharmacologist. The treatise is remarkable for the extent of its research, the variety of its information, whether scientific, commercial, or practical, and the scrupulous exactness of its statements. In 1841, he procured the license to practice in London from the college of physicians; in 1845 he was elected a fellow of that body; and on the establishment of the London university he was appointed examiner in materia medica and pharmacy, a post which he filled with admirable efficiency till his death. Among his other contributions to science, the best known are his excellent treatises on *Diet* and on *Polarized Light*, both of which appeared in 1843. His death, which took place on Jan. 20, 1853, was the result of a fall down a

flight of steps in the college of surgeons, and was deeply felt, not only by his professional brethren, but by the numerous scientific bodies, such as the Royal, the Linnæan, and the other societies of which he was a distinguished fellow.

PÉREIRE, Emile, and Isaac, sons of Jacob Rodriquez, an Israelite distinguished for having instituted deaf and dumb schools in France; b. respectively in 1800 and 1806 in Bordeaux. Émile began life as a co-laborer with Armand Carrel upon the *Globe* and *National* of Paris, and was an enthusiastic St. Simonite. In 1832 he projected the first railroad in France, from Paris to St. Germain, and succeeded in getting the capital to undertake its construction. The brothers soon obtained the contract for building the railroad of the north, and in this, and subsequent railroad work, realized great fortunes. In 1852, in connection with the Rothschilds, they conceived and established the *Société générale du crédit mobilier* with a nominal capital of 60,000,000 francs. Its operation became enormous in a short time, stimulated every kind of business, and encouraged vast speculations. Though not a bank of issue, it so manipulated the rapid exchange of capital as to give the effect of a vast increase of money in circulation. After becoming the center of enormous operations, not only in France, but as a medium of loans throughout Europe, it collapsed in 1867, and absorbed in its liquidation a part of the enormous fortunes made by the brothers Péreire in its management. Émile was the virtual head of the projects of the brothers, and Isaac the executive hand. The latter is author of a pamphlet entitled *Rôle de la Banque de France et l'organizeation du credit en France,* and others, financial and religious. Émile died in Paris in 1875, and Isaac in 1880.

PEREJASSLAVL', an ancient t. of Russia, in the gov. of Poltava, 100 m. s. of Tchernigov, at the confluence of the Trubesh and Alta, near the Dneiper. A battle was fought here in 1149.

PEREKOP, Isthmus of, in south Russia, gov. of Taurida, 18 m. long, 16 m. broad at its southern, and 5 m. broad at its northern extremity, connects the peninsula of the Crimea with the mainland of European Russia. It is an arid waste of mere sand, or sand combined with clay. There are, however, numerous salt lakes, and salt is extensively made. In the n. of the isthmus, and forming the key to the Crimea, is the small t. of Perekop. Notwithstanding its advantageous position at the convergence of the numerous roads leading from South Russia into the Crimea, Perekop is of little commercial importance. Pop. of town, '91, 1574.

PÈRE-LA-CHAISE. See La-Chaise.

PEREMPTORY DEFENSES, in Scotch law, mean defenses to an action or suit, which amount to an entire negative of the right of action, as distinguished from a preliminary or temporary defense.

PEREN'NIAL, in botany, a term employed in contradistinction to annual (q.v.) and biennial (q.v.) to designate plants which subsist for a number of years. Some plants, however, which are annual in cold climates, are perennial in warmer regions. The term perennial is in general applied only to herbaceous plants, and indicates a property only of their roots, the stems of most of them dying at the end of each summer. Perennial herbaceous plants, like shrubs and trees, are capable of producing flowers and fruit time after time, in which they differ from annual and biennial plants, which are fruitful only once. Those plants which are capable of being propagated by cloves, offset bulbs, or tubers, are all perennial. Thus the potato is a perennial plant, although the crop is planted in spring and reaped in autumn, like that of corn, whilst all the corn plants are annuals.—There is a great diversity in the duration of life of perennial plants.

PERESLAV', or Pereiasla'vle-zalie'sky, a district t. in the middle of great Russia, in the gov. of Vladimir, and 70 m. n.w. of the city of that name. It was founded in 1052 by George, prince of Sousdal. It possesses numerous churches and religious institutions; but is principally noteworthy for the factories, which are its main prop, and of which the most important are cotton-mills and print-works for cotton goods. The factories are in an increasingly prosperous condition. The cotton manufactures of Pereslav are exported to the fairs of Nijni-Novgorod and Irbit, and even to China by way of Siberia. Pop. 13,600, employed in the factories and in the productive fishery of lake Pleshtcheieff.

PEREZ, Antonio, Minister of Philip II. of Spain, was born in Aragon in 1541. His father was secretary of state under Charles I. and Philip II., and he himself was appointed to this office when only 25 years of age, and acquired the entire confidence of the king. Don Juan d'Austria, having sent his confidant, Juan de Escovedo, to Spain, to solicit aid against the party of Orange; and Escovedo having rendered himself an object of hatred both to the king and to Perez, the former resolved to put him out of the way by murder, and intrusted Perez with the accomplishment of this design, which Perez, to gratify his own revenge, accomplished accordingly, Mar. 31, 1578. The family of Escovedo denounced Perez as the murderer, and all his enemies joined against him. The king at first sought to shield him; but in July, 1581, he was arrested, and by torture forced to confess. He succeeded, however, in making his escape to Aragon, were he put himself under protection of its laws. After a long and severe inquiry into his conduct, he was found guilty of many acts of fraud and corruption, and condemned to death in Madrid; but the *justicia major,* or highest court of justice in Saragossa, refused

to deliver him up. The king applied for aid in May, 1591, to the inquisition, and the Aragonese court delivered him up to its agents, but the people rose in tumult, and liberated him. This happened repeatedly; and at last, in Sep., 1591, Philip II. entered Aragon with an army powerful enough to subdue all opposition, abolished the old constitutional privileges of the country, and caused a number of the principal people to be executed. Perez, however, made his escape, avoiding the many plots which the king laid for his assassination. He was condemned in Spain as a heretic, but was treated with great kindness in Paris and London. He spent the latter years of his life in Paris, and died there in 1611 in great poverty. Perez wrote an account of his misfortunes, which was published at Paris in 1598, under the title of *Relaciones.*

PERFECTIBIL'ITY OF CHRISTIANS, a doctrine held by the Wesleyan Methodists (see METHODISTS) of a *Christian perfection* attainable in this life. It is not a perfection of *justification*, but a perfection of *sanctification;* which John Wesley, in a sermon on Christian perfection, from the text Heb. vi. 1, "Let us go on to perfection," earnestly contends for as attainable in this life by believers, by arguments founded chiefly on the commandments and promises of Scripture concerning sanctification; guarding his doctrine, however, by saying that it is neither an *angelic* nor an *Adamic* perfection, and does not exclude ignorance and error of judgment, with consequent wrong affections, such as "needless fear or ill-grounded hope, unreasonable love, or unreasonable aversion." He admits, also, that even in this sense it is a rare attainment, but asserts that "several persons have enjoyed this blessing, without interruption, for many years, several enjoy it at this day, and not a few have enjoyed it unto their death, as they have declared with their latest breath, calmly witnessing that God had saved them from all sin, till their spirit returned to God." Concerning all which, the general belief of Protestant Christians is, that these persons were merely more self-complacent and less sensible of their own corruptions than is usual, and that the commands and promises concerning sanctification are all susceptible of an explanation consistent with remaining corruption in believers, and a need of further sanctification, or a continued going on unto perfection whilst this life endures.

That perfection is attainable in this life is held by the Franciscans, Jesuits, and Molinists in the church of Rome, but denied by the Dominicans and Jansenists. In advocating the doctrine, its Roman Catholic supporters generally rest much on the distinction between mortal and venal sins.

PERFE'CTIONISTS, or BIBLE COMMUNISTS, popularly known as FREE-LOVERS, or preachers of free love, a small American sect who are equally remarkable for the doctrines which they hold, and for the unfaltering way in which they carry them out in practice. The founder of the sect was John Humphrey Noyes (q.v.). He was well described by William Hepworth Dixon, in his work on *New America*, as "a tall, pale man, with sandy hair and beard, gray dreamy eyes, good mouth, white temples, and a noble forehead." In appearance he was a little like Mr. Carlyle, and is said to have been not a little proud of the resemblance. Noyes was born at the town of Brattleborough in Vermont; he studied at Dartmouth college, N. H., where he took a degree; and he afterward became a clerk in a lawyer's office at Chesterfield. In 1831 a revival of religion broke out at Putney, and Noyes was one of those who were aroused to a consciousness of sin and anxiety about the way of salvation. He began to puzzle over theological questions; and he gave up the law to study theology at Andover, in Massachusetts. There he spent a year in unremitting study of the Bible; but was exposed to many temptations, owing to the habits prevailing among his fellow students. From Andover he passed to Yale college, New Haven, where he was first a student, afterwards a preacher in connection with the Congregational body, and where he became a great seeker after truth—not as it stands between God and man only, but as between man and man. Here it was that he arrived at the principal of the ideas which constitute his social and religious system—deriving them, after much study and speculation, from the writings of St. Paul. He came to the conclusion that the opinions of St. Paul had been completely misconceived by all the Christian churches; that all our ecclesiastical organizations have consequently been blunders; and that from the apostolic age to his own there had been no visible church of Christ upon earth. He conceived that in the age of Paul and Peter there had been a true Christian church—a communion of saints, in which all were brethren, and all equals; but that it passed away at an early date, on our Lord having returned in the spirit, as he had promised, to dwell among his people forever. This second advent of Christ he placed in the year 70; and he came to the conclusion that since then the true church has consisted, not of any of the religious organizations which have successively sprung up, but of saintly persons scattered here and there, sinless in body and soul, confessing Christ as their lord, professing holiness, rejecting law and usage, and submitting their passions to the divine will. He believed that Christ, on his second advent, abolished the old law, and closed the reign of sin which began with Adam; and that he has thenceforth set up his kingdom in the hearts of all willing to accept his reign. For such persons there was no longer any law or rule of duty; neither the Mosaic code, nor the sermon on the mount, nor the ordinances or institutions of civil society were binding upon them; they were a law unto themselves; they were free to do as they pleased, but—with exceptions which, however, could not invalidate an eternal

truth—under the influence of the divine spirit which dwelt in them, they could only do that which was right. It was owing to the power of the devil that the churches had gone so far astray; but he conceived that the time had come when, among the new communities of America, there should be set up a perfect model of a Christian church—in which all should be brethren; in which men and women should be equals; in which individuals should be untrammeled by any restraints save those imposed by the divine spirit working within themselves. Noyes took upon himself the task of laying the foundations of the true Christian church; but before setting to the work, he is accused of having furnished at once evidence of his belief in his theory, and an illustration of the dangers attending it in practice. His mind once satisfied that there was no law for him, he gave the rein, it is said, to dissipation, and for some time abandoned himself to licentiousness. This, however, is denied as a malicious calumny.

His early efforts at establishing a church, made at New Haven, were very discouraging; he made converts to his views, and they became only too deeply imbued with his theory. Each being a law unto himself, they had conflicting desires, and this led to quarreling, and eventually to schism. Among the men, there were some who contested with Noyes the leadership of the fraternity; and among the women, one or two who, in spite of his theory, expected him to marry them. At the end of four years, he found, that though he had co-believers, he had no followers; and he retired to Putney, disappointed, but resolved to make a new experiment. He determined to make trial of the principle of association—of association under conditions which he deduced from the New Testament; to establish a "Bible family"—a society disavowing all law and all connection with the world, in which all should be brethren, perfectly equal; in which, therefore, worldly goods should be held in common; in which there should be no appropriation of men and women to one another. The connection of the sexes was, upon his view, as free from law, as completely subject to the desires of individuals, as every other human relation; and besides, he seems to have thought a community of women a logical sequence from a community of goods. He saw that the members of such a society must be selected and educated for it; and he set up a Bible class, by means of which he gained a sufficient number of proselytes, and educated them for Bible association. Before long, there was nothing wanting for a trial of his scheme but money to buy a house and a piece of land; and this he got by marrying one of his converts, a young lady named Harriet Holton, to whom it is but fair to say, he candidly explained that with his principles marriage could be nothing but a form. Then he and his associates formally renounced their allegiance to the United States, and set up house in "celestial order" at Putney. His wife, mother, sister, and brother were among the members of the new society; the others were all persons of some means and position—preachers, farmers, doctors, with their wives and children. Their property was thrown into a common stock; they gave up the use of prayer, all religious service, and the observance of the Sabbath; those who were married renounced their marriage ties, and a "complex marriage" was established between all the males and all the females of the "family." To get rid of the inconveniences which had been found attendant upon the exercise of Christian liberty, Noyes had set up a new principle, viz., sympathy, by which the individual will was to be corrected, which practically imposed upon individuals the duty of deferring to the feelings and opinions of the brethren. He now taught that the family was wiser than the individual, who *might* stray from the path of grace; that the individual was erring when he differed from the family; and that the inclinations of individuals must be submitted to the opinion of the family. Having dispensed with law, he set up public opinion as a controlling power in its stead; and free criticism of one another by the members of the society became an important feature of his system. Quarreling, however, broke out among the members; their differences were brought before the law-courts; and when the details of the family system became known, the people of Putney made the place too hot for the Perfectionists. Their establishment was broken up; but a portion of the Putney family—about fifty men, as many women, and about the same number of children—soon established themselves in a new home, in the sequestered district of Oneida, in the state of New York. Among the things which first drew attention to the Putney family was a controversy which Noyes maintained with the leaders of another society of Perfectionists established at Oberlin. The Perfectionists were divided upon the question, whether of the two leading features of their system, the profession of holiness and the right of Christian liberty, the one or the other was the more important—some were "liberty-men," others "holiness-men." Noyes took up the controversy on behalf of the latter.

At Oneida creek, the new "family" purchased about 600 acres of forest-land, and proceeded to bring it under cultivation. They have made it one of the most productive estates in the union; they have also established manufactures of various kinds; and in the course of 30 years, they have become a prosperous, and even a wealthy community. Their wealth they owe in a great measure to the inventive talent of one of the "family," an old Canadian trapper, named Sewell Newhouse, who invented an improved form of trap—the "Oneida trap"—which is now almost universally used by trappers throughout America. In other respects, the "family" has been very prosperous: it consisted in the year 1874 of in all 238 persons, who lived together in a state of great harmony and contentedness; and being already sufficiently numerous, it had to reject frequent applications

which were made for admission to membership. (A small society was established at Wallingford, Conn.; which became a joint-stock company, 1881.) Their neighbors soon became accustomed to the Perfectionists and their ways, and let them live in peace; Noyes even became popular. On settling at Oneida, guided by his experience, he modified many of the details of his arrangements. Between study and labor, the life of the "family" at Putney had been rather a hard one—he told his followers that in future they should enjoy life as became men to whom all things were pure and permitted. The society chose no chiefs, believing that, without chiefship, the management of their affairs must fall to the fittest persons; and their affairs have been ably managed. The controlling function of criticism was strengthened by being made more systematic; and a regard for the common good, grown strong through habit, has made persons who disavow all laws perfectly submissive to the unwritten laws of public opinion. In the smallest, as well as in important affairs, the Perfectionist practices submission to the opinion of his brethren: in small matters, he usually gathers it by consultation with some of the older members of the body; important ones are submitted to the "family" at their evening meetings. All are busy; and they work as hard for the general interest as men do in the hope of enriching themselves. The men wear no particular garb, but usually dress like the country-people around them; the women have their hair cut short, and parted down the center; abjure stays and crinoline; wear a tunic, falling to the knee, and trousers of the same material; a vest, buttoning high toward the throat; and a straw hat. In this costume, according to Mr. Hepworth Dixon, plain women escape notice, and pretty girls look winsome; but, as may be inferred from the treatment of their hair, it has been no part of the Perfectionist system to make the women look bewitching. The "family" has breakfast at six o'clock, dinner at twelve, and the evening-meal at six in the afternoon; the more advanced of its members abstain from animal food; they drink no beer, and only a weak home-made wine; and like most of the new American sects, they will have nothing to do with doctors. The women are allowed a good deal of influence.

Up to 1879 the men and women were united by a "complex marriage," but their intercourse—which, in theory, was unfettered by any law—was, in practice, subject to a good deal of regulation. Like everything else, it has become subject to the opinion of the society, and certain principles had been so steadily applied to it that they had gained the force of laws. First, there was the principle of the ascending fellowship. There should be contrast, the Perfectionists said, between those who became united in love. That there should be difference of temperament and of complexion had, they said, been well ascertained by physiologists. They held that there should be a difference in age also, so that the young and passionate might be united to those who had, by experience, gained self-control. In virtue of this principle, the younger women fell to the older men, and the younger men to the older women. A second principle was that there should be no exclusive attachment between individuals; a third, that persons should not be obliged to receive the attentions of those whom they did not like; and, lastly, it was held indispensable that connections should be formed through the agency of a third party—because, without this, the question of their propriety might be withdrawn from criticism, and also because this afforded a lady an easy opportunity of declining. The human heart, the Perfectionists said, is capable of loving any number of times, and any number of persons at the same time, and the more it loves the more it can love. The system of the "complex marriage" was therefore suitable to, while monogamy imposed a restriction upon, human nature; and they believed that marriage would be spurned by the churches as soon as they got rid of the false notion of the essential sinfulness of love. They are confident that, when they have worked out a few details still incomplete, their system will be perfect, and that it will, before long, be imitated throughout the length and breadth of America. There are four things, according to Noyes, necessary to the organization of a true family: (1) The reconciliation of its members with God; (2) their salvation from sin; (3) recognition of the brotherhood and equality of man and woman; (4) community of labor and its fruits; and communism can only prosper when the previous conditions exist. The Perfectionists hold that for reconciliation to God and salvation from sin nothing is necessary but faith; let a man believe that he is reconciled to God, and his sins are immediately washed away. See Oneida Community.

PERFORMANCE OF CONTRACTS is one of the modes of satisfying the contract, which may be either by doing some specific thing, or not doing something, or by payment of money. It is a good answer to any action brought by one party against another for breach of contract, that what was contracted for has been already performed.

PERFUMERY—PERFUMES (Fr. *perfum*, from Lat. *fumus*, smoke or vapor), delicate fumes or smells. Perfumes are of three distinct classes when derived from plants, and there is a fourth class which are of animal origin.

Class I.—These are the most ancient, and have been in use from the earliest period of which there is record. They consist of the various odiferous gum-resins, which exude naturally from the trees which yield them; and to increase the produce, the plants are often purposely wounded. The most important are benzoin, olibanum, myrrh, and camphor. No less than 5000 cwt. of these together are annually imported into America. Gum-resins form the chief ingredients in "incense" (q.v.), and in pastilles (q.v.).

Class II. are those perfumes which are procured by distillation. As soon as the Greeks and the Romans learned the use of the still, which was an invention imported by them from Egypt, they quickly adapted it to the separation of the odorous principle from the numerous fragrance-bearing plants which are indigenous to Greece and Italy. An essential oil or otto thus procured from orange-flowers bears in commerce to this day the name of neroly, supposed to be so named after the emperor Nero. Long before that time, however, fragrant waters were in use in Arabia. Odor-bearing plants contain the fragrant principle in minute glands or sacs; these are found sometimes in the rind of the fruit, as the lemon and orange; in others it is in the leaves, as sage, mint, and thyme; in wood, as rosewood and sandal-wood; in the bark, as cassia and cinnamon; in seeds, as caraway and nutmeg. These glands or bags of fragrance may be plainly seen in a thin-cut stratum of orange peel; so also in a bay leaf, if it be held up to the sunlight, all the oil cells may be seen like specks, All these fragrant-bearing substances yield by distillation an essential oil peculiar to each; thus is procured oil of patchouly from the leaves of the patchouly plant, *Pogostemon patchouly*, a native of Burmah; oil of caraway, from the caraway seed; oil of geranium, from the leaves of the *geranium rosa*; oil of lemon, from lemon peel; and a hundred of others of more infinite variety.

The old name for these pure odiferous principles was quintessence. Latterly, they have been termed essential oils; they are now, in modern scientiffc works, often termed ottos, from the Turkish word attar, which is applied to the well-known otto or attar of roses. See Oil.

All the various essential oils or ottos are very slightly soluble in water, so that in the process of distillation the water which comes over is always fragrant. Thus, elder water, rose water, orange water, dill water are, as it were, the residue of the distillation for obtaining the several ottos. The process of distillation (q.v.) is very simple; the fragrant part of the plant is put into the still and covered with water; and when the water is made to boil the ottos rise along with the steam, are condensed with it in the pipe, and remain floating on the water, from which they are easily separated by decanting. In this way 100 lbs. of orange, lemon, or bergamot fruit peel will yield about 10 oz. of the fragrant oil; 100 lbs. of cedar-wood will give about 15 oz. of oil of cedar; 100 lbs. of nutmeg will yield 60 to 70 oz. of oil of nutmeg; 100 lbs. of geranium leaves will yield 2 oz. of oil.

Every fragrant substance varies in yield of essential oil. The variety of essential oils is endless; but there is a certain relationship among odors as among tints. The lemon-like odors are the most numerous, such as verbena, lemon, bergamot, orange, citron, citronella; then the almond-like odors, such as heliotrope, vanilla, violet; then spice odors—cloves, cinnamon, cassia. The whole may be classified into 12 well-defined groups. All these ottos are very soluble in alcohol, in fat, butter, and fixed oils. They also mix with soap, snuff, starch, sugar, chalk, and other bodies, to which they impart their fragrance.

The principal consumption of the various fragrant ottos is for scenting soap. Windsor soap, almond soap, rose soap, and a great variety of others, consist of various soaps made of oil and tallow, perfumed while in a melted state with the several named ottos or mixtures of them.

Though snuff is by no means so popular an article in the nineteenth century as it was in the eighteenth, yet the increased population, and the extended exports to colonies, cause a production of scented snuff positively greater now than 50 years ago; and it is especially in demand in the fur countries of northern Canada. There is a large consumption of fragrant essential oils in the manufacture of toilet powders; under the various names of rose powder, violet powder, etc., a mixture of starch and orris, differently scented, is in general demand for drying the skin of infants after the bath.

Precipitated chalk and powdered cuttle-fish bone, being perfumed with otto of roses, powdered myrrh, and camphor, become "dentifrice." The ottos of peppermint, lavender, rose, and others, are extensively used in scenting sweetmeats and lozenges.

More than 200,000 pounds-weight of various ottos have been imported into Britain in one year, and valued at over $900,000; to this must be added at least one-third as much again distilled in England. Of the imported articles enumerated, oils of lemon and bergamot, from the Two Sicilies, reached 128,809 lbs., valued at $300,000.

Class III.—These are the perfumes proper, such as are used for perfuming handkerchiefs, etc. Contrary to the general belief, nearly all the perfumes derived from flowers are not made by distillation, but by the processes of *enfleurage* and *maceration*. Although this mode of obtaining the odors from flowers has certainly been in practice for two centuries in the valley of the Var, in the s. of France, it is only by the publication of a recent work* that the method has been made generally known. The odors of flowers do not, as a general rule, exist in them as a store or in a gland, but are developed as an exhalation. While the flower breathes it yields fragrance, but kill the flower, and fragrance ceases. It has not been ascertained when the discovery was made of condensing, as it were, the breath of the flower during life; what we know now is that if a living flower be placed near to grease, animal fat, butter, or oil, these bodies absorb the odor given off by the blossom, and in turn themselves become fragrant. If we spread fresh

* *Art of Perfumery*, by Septimus Piesse, PH.D., 8vo. 50 cuts. Longman.

unsalted butter upon the bottom of two dessert-plates, and then fill one of the plates with gathered fragrant blossoms of clematis, covering them over with the second greased plate, we shall find that after 24 hours the grease has become fragrant. The blossoms, though separated from the parent stem, do not die for some time, but live and exhale odor, which is absorbed by the fat. To remove the odor from the fat, the fat must be scraped off the plates and put into alcohol; the odor then leaves the grease and enters into the spirit, which thus becomes "scent," and the grease again becomes odorless.

The flower farmers of the Var follow precisely this method on a very large scale, with but a little practical variation, with the following flowers: rose, orange, acacia, violet, jasmine, tuberose, and jonquil. The process is termed *enfleurage.* In the valley of the Var there are acres of jasmine, of tuberose, of violets, and the other flowers named; in due season the air is laden with fragrance, the flower harvest is at hand. Women and children gather the blossoms, which they place in little panniers like fishermen's baskets hung over the shoulders. They are then carried to the laboratory of flowers and weighed. In the laboratory the harvest of flowers has been anticipated. During the previous winter great quantities of grease, lard, and beef-suet have been collected, melted, washed, and clarified. In each laboratory there are several thousand *châssis* (sashes), or framed glasses, upon which the grease to be scented is spread, and upon this grease the blossoms are sprinkled or laid. The *châsse en verre* is, in fact, a frame with a glass in it as near as possible like a window-sash, only that the frame is two inches thicker, so that when one châsse is placed on another, there is a space of four inches between every two glasses, thus allowing space for blossoms. The flower blossoms are changed every day, or every other day, as is convenient in regard to the general work of the laboratory or flowering of the plants. The same grease, however, remains in the châsse so long as the particular plant being used yields blossoms. Each time the fresh flowers are put on, the grease is "worked"—that is, serrated with a knife—so as to offer a fresh surface of grease to absorb odor. The grease being *enfleurée* in this way for three weeks or more—in fact, so long as the plants produce blossoms—is at last scraped off the châsse, melted, strained, and poured into tin canisters, and is now fit for exportation. Fat or oil is perfumed with these same flowers by the process of maceration; that is, infusion of the flowers in oil or melted fat. For this end purified fat is melted in a *bain marie,* or warm bath, and the fresh blossoms are infused in it for several hours. Fresh flowers being procured, the spent blossoms are strained away, and new flowers added repeatedly, so long as they can be procured. The *bain marie* is used in order to prevent the grease becoming too hot from exposure to the naked fire; so long as the grease is fluid, it is warm enough. Oil does not require to be warmed, but improved results are obtained when it is slightly heated.

Jasmine and tuberose produce best perfumed grease by enfleurage, but rose, orange, and acacia give more satisfactory products by maceration; while violet and jonquil grease is best obtained by the joint processes—enfleurage followed by maceration. For enfleurage of oil a *châsse en fer* is used. In the place of glass, the space is filled with a wire net, on which is laid a *molleton,* or thick cotton fabric—moleskin soaked with oil; on this the flowers are laid, just as with solid grease. In due time—that is, after repeated changing the flowers—the oil becomes fragrant, and it is then pressed out of the moleskin cloth. Oil of jasmine, tuberose, etc., are prepared in this way. In order now to obtain the perfume of these flowers in the form used for scenting handkerchiefs, we have only to infuse the scented fat or oil, made by any of the above methods, in strong alcohol.

In extracting the odor from solid fat it has to be chopped up fine as suet is chopped, put into the spirit, and left to infuse for about a month. In the case of scented oil it has to be repeatedly agitated with the spirit. The result is that the spirit extracts all the odor, becoming itself "perfume," while the grease again becomes odorless; thus is procured the essence of jasmine, essence of orange flowers, essence of violets, and others already named, rose, tuberose, acacia, and jonquil.

It is remarkable that these flowers yield perfumes which, either separate or mixed in various proportions, are the types of nearly all flower odors; thus, when jasmine and orange flowers are blended, the scent produced is like sweet-pea; when jasmine and tuberose are mixed, the perfume is that of the hyacinth. Violet and tuberose resemble lily of the valley. All the various bouquets and nosegays, such as "frangipanni," "white roses," "sweet daphne," are made upon this principle.

The commercial importance of this branch of perfumes may be indicated by the quantity of flowers annually grown in the district of the Var. Flower harvest: orange blossoms, 1,475,000 lbs.; roses, 530,000 lbs.; jasmine, 100,000 lbs.; violets, 75,000 lbs.; acacia, 45,000 lbs.; geranium, 30,000 lbs.; tuberose, 24,000 lbs.; jonquil, 5,000 lbs.

Class IV.—Perfumes of animal origin: The principal are musk (q.v.), ambergris (q.v.), civet (q.v.), and castoreum (q.v.). The aroma of musk is the most universally admired of all perfumes; it freely imparts odor to every body with which it is in contact. Its power to impart odor is such that polished steel will become fragrant of it if the metal be shut in a box where there is musk, contact not being necessary.

In perfumery manufacture, musk is mixed with other odorous bodies to give permanence to a scent. The usual statement as to the length of time that musk continues to give out odor has been called in question. If fine musk be spread in thin layers upon

any surface, and fully exposed to a changing current of air, all fragrance, it is said, will be gone in from 6 to 12 months.

Civet is exceedingly potent as an odor, and when pure, and smelled at in the bulk of an ounce or so, is utterly insupportable from its nauseousness; in this respect it exceeds musk. When, however, civet is diluted so as to offer but minute quantities to the olfactories, then its perfume is generally admitted; this is so with gas-tar; but the fragrant principle is the same as that breathed by the beautiful narcissus. Castor is in our day almost obsolete as a perfume. The United States imported perfumes and cosmetics in 1881 to the value of $458,274; in 1885, to the value of $355,629; in 1890, to the value of $423,963. The falling off of the importations is due to the increased production of the higher grades of perfumery in this country.

The works on perfumes are very few; that of Mme. Celnart, in the Libraire Roret, is most worthy of notice among the French; a translation of it has been made by Mr. C. Morfit of Philadelphia. In England, *The British Perfumer*, by C. Lilly (1822), was the only work of the kind published in England prior to the *Art of Perfumery* by S. Piesse (1855). See also Rimmel's *Book of Perfumes* (1875).

PER'GAMUS, or PERGAMUM, anciently a city of Mysia in Asia Minor, on the navigable river Caïcus, at the distance of 120 stadia from the sea. According to tradition, the place was of Greek origin, but its early history is quite insignificant. It first acquired prominence when Lysimachus, one of Alexander's generals, chose it as a stronghold in which to keep his treasures. Under Philetærus it became the capital of a state, 283 B.C. His successor, Eumenes I., maintained its independence against the Seleucidæ, although the title of king was first assumed by Attalus I., who reigned from 241 to 197 B.C. He intimately allied himself with the Romans against Philip of Macedon, and this alliance subsisted throughout succeeding reigns, in which the kingdom increased in extent and importance, till at last Attalus III., surnamed Philometer, who died in 133 B.C., left it with all his treasures to the Romans, who successfully maintained the right thus acquired, and under whom the city continued to flourish. It was the focus of all the great military and commercial routes of Asia Minor, and Pliny describes it as *longe clarissimum Asiæ Pergamum*. The Attali collected in Pergamus a library only inferior to that of Alexandria. It was also the seat of a famous grammar-school, and it gave its name to parchment (q.v.). Pergamus sank under the Byzantine emperors, but the place still exists under the name *Bergamah*, and is noted for the splendor and magnificence of its ruins, which embrace temples, palaces, aqueducts, gymnasia, amphitheaters, and city walls.

PERGOLESE, GIOVANNI BATTISTA, an eminent musician of the Neapolitan school. Evidence regarding the date and place of his birth is conflicting; probably the correct account is that of the marchese di Villarosa, his latest biographer, who states that he was born at Jesi, near Ancona, on Jan. 3d, 1710. In 1717 he was admitted into the Conservatorio dei Poveri di Gesù Cristo at Naples, where he studied the violin under Domenico di Matteis, and musical composition under Gaetano Greco and Durante. Under the conviction that melody and taste were sacrificed to learning by most of the masters of his time, he abandoned the style of Scarlatti and Greco for that of Vinci and Hasse. His first great work was the oratorio of *San Guglielmo d'Aquitania*, composed in 1731. In that and the following year appeared his operas of *La Serva Padrona; Il Prigionier Superbo;* and *Lo Frate Innamorato;* in 1734, *Adriano in Siria;* in 1735, *Il Flaminio* and *L'Olimpiade*. In 1734 he received the appointment of *maestro di capella* of the church of Loretto. In consequence of delicate health he removed to Pozzuoli, where he composed the cantata of *Orfeo*, and his pathetic *Stabat Mater* He died there of consumption in 1736. Besides the above-mentioned works, Pergolese composed a number of pieces for the church, which were better appreciated during his life-time than his secular compositions, also a violin concerto, and thirty trios for violin, violoncello, and harpsichord. His works are all characterized by sweetness and freedom of style.

PERI (Fairy), according to the mythical lore of the east, a being begotten by fallen spirits, which spends its life in all imaginable delights, is immortal, but is forever excluded from the joys of paradise. It takes an intermediate place between angels and demons, and is either male or female. So far from there being only female peris, as is supposed by some, and these the wives of the devs, the peris live, on the contrary, in constant warfare with these devs. Otherwise, they are of the most innocuous character to mankind, and, exactly as the fairies, with whom our own popular mythology has made us familiar, are, when females, of surpassing beauty. One of the finest compliments to be paid to a Persian lady is to speak of her as perizadeh (born of a peri; Greek, parisatis). They belong to the great family of genii, or gin: a belief in whom is enjoined in the Koran, and for whose conversion, as well as for that of man, Mohammed was sent (cf. Koran, chaps. lv., lxxii., and lxxiv.).

PERIAGUA, a large canoe composed of the trunks of two trees, hollowed and united into one fabric; whereas an ordinary canoe is formed of the body of one tree

only. Periaguas are used in the Pacific, and were formerly employed among the West India islands, whence the frequent allusion to them in *Robinson Crusoe*.

PERIANDER, Tyrant of Corinth, d. B.C. 585; succeeded his father Cypselus about 625. His first measures, on coming to the throne, were to close all the clubs and common tables, and keep the upper classes under espionage. He then raised a fleet and an army, and allied himself with other Greek despots, and with barbarian kings. His last years were unfortunate. His son, Sycophron, was assassinated by the Corcyræans, and Periander killed his wife in a fit of jealousy. His weak-minded son Cypselus was the sole survivor of his dynasty. He is said to have left a didactic poem in 2,000 verses.

PERIANTH (Gr. *peri*, around, *anthos*, a flower), in botany, the floral envelope (see FLOWER) of those plants in which the calyx and corolla are not easily distinguished. The term is convenient, as it can be applied indifferently to the calyx and corolla; thus, when there is either a calyx or corolla existing, but not both, the perianth is said to be *single;* when both are present, *double*. Both are really present in many endogenous plants, to which the use of the term perianth is confined by some botanists; the single floral envelope of exogenous plants being regarded as a calyx, and the corolla supposed to be wanting. The perianth is *regular* in some plants, *irregular* in others. It often displays great beauty, as in tulips, crocuses, lilies, etc.

PERICARDI'TIS, or inflammation of the pericardium (q.v.), is a disease of frequent occurrence; the result of a very large number of post-mortem examinations being to show that about 1 in 23 of all who die at an adult age exhibits traces of recent or old attacks of this disorder.

For reasons which will be obvious when we come to speak of the physical signs of this disease, we shall commence with a notice of the anatomical changes which take place in the inflamed membrane. Very soon after symptoms of pericarditis begin to show themselves there is an abnormal dryness of the serous membrane, which is speedily followed by an increased secretion of fluid. The secreted fluid is sometimes almost entirely fibrinous, in which case it coagulates, and gives rise to adhesions between the heart and the pericardium; or it may consist almost entirely of serum, which remains liquid; or it may be, and it most frequently is, a mixture of the two. When there is a large amount of liquid effusion (as, for instance, a third of a pint or more) which is not re-absorbed, death usually takes place in the course of a few days, in consequence of the interference of the fluid with the heart's actions; but when there is not much liquid effusion, or when the liquid part is absorbed, the pericardium becomes more or less adherent, and apparent recovery usually takes place.

In the cases that prove fatal when fibrinous fluid has been effused, but has not coagulated to such an extent as to cause complete adhesion of the heart to the pericardium, the partially coagulated fibrin (or lymph, as the older authors styled it) is seen to be of a yellowish-white color, and to occur in a rugged, shaggy, or cellular form. Laennec compared the surface on which the lymph is deposited to that which would be produced by suddenly separating two flat pieces of wood between which a thin layer of butter had been compressed. Dr. Watson regards the appearance as more like the rough side of pieces of uncooked tripe than anything else; while others have compared it to lace-work, cut sponge, a honey-comb, a congeries of earth-worms, etc. When the patient dies at a more advanced stage of the disease—viz., soon after the whole of the membrane has become adherent—incipient blood-vessels, in the form of red points and branching lines, are seen, indicating that organization is commencing in the deposit, which, if death had not ensued would have been finally converted into cellular or areolar tissue, and have occasioned the complete obliteration of the pericardial cavity.

The symptoms of pericarditis are pain in the situation of the heart, increased by a full inspiration, by pressure upon or between the ribs in the cardiac region, and especially by pressure upwards against the diaphragm by thrusting the fingers beneath the cartilages of the false ribs; palpitations; a dry cough and hurried respiration; discomfort or pain on lying on the left side; restlessness; great anxiety of countenance; and sometimes delirium. The pulse usually beats from 110 to 120 in a minute, and is sometimes intermittent; and febrile symptoms are always present. These symptoms are seldom collectively present in any individual case, and until the time of Louis the diagnosis of this disease was uncertain and obscure. The physical signs, dependent on the anatomical changes which have been described, are, however, generally so distinct that by their aid the disease can be readily detected. They are three in number. 1. In consequence of irritation propagated to the muscular tissue of the heart at the commencement of the inflammation of its investing membrane, the ventricles contract with increased force, rendering the sounds of the heart louder and its impulse stronger than in health, or than in the more advanced stages of the disease. 2. When much fluid is effused into the pericardium, dullness on percursion is always observable to a greater degree than in health. This sign, which is very characteristic, is seldom perceived till the disease has continued for two or three days. In relation to this increased dullness, we must premise that in the healthy condition of the heart and lungs there is an irregular roundish space with a diameter of somewhat less than 2 in., extending from the sternum (or breast bone) between the level of the fourth and fifth ribs towards the left nipple, in which a portion of the surface of the heart is not overlapped by the lungs, but lies in contact with

the walls of the chest. This space should normally be dull on percussion. In pericarditis the extent of the dullness beyond the normal limit indicates the amount of effusion. In extreme cases the dullness may extend over a space whose diameter is 7 in. or more. Simultaneous with the increased dullness, there is a diminution of the heart's sounds in consequence of the intervening fluid, and the impulse is often scarcely perceptible. 3. The rubbing of the inflamed and roughened surfaces upon each other gives rise to a sound which is commonly called the *friction sound*, but which has received various names. Thus Dr. Watson calls it a *to-and-fro* sound, and observes regarding its variations that, "like all the other morbid sounds heard within the chest, it is capable of much variety in tone and degree Sometimes it very closely resembles the noise made by a saw in cutting through a board; sometimes it is more like that occasioned by the action of a file or of a rasp; but its essential character is that of *alternate rubbing;* it is a *to-and-fro* sound." This sound is heard early in the disease, before the surfaces of the pericardium are separated by the effusion of fluid; and it is due either to the dryness of the membrane, or to its roughness from the deposition of lymph. When the contiguous surfaces are either separated by fluid, or become adherent, the sound disappears; but when it has been lost from the first of these causes, it reappears after the fluid has been so far absorbed as to permit the surfaces again to come in contact. But here, again, its duration is brief, for the surfaces soon become adherent and cease to rub upon each other.

Pericarditis is a disease which occasionally runs a very rapid course, and terminates fatally in forty-eight hours or less. In ordinary cases, however, which terminate in apparent recovery, the disease generally begins to yield in a week or ten days, and excepting that adhesion remains, the cure appears to be complete in three weeks or less. But although these patients *apparently* recover, the pericardial adhesion commonly occasions other structural changes of the heart sooner or later to develop themselves; and in those cases that the physician has the opportunity of subsequently watching, it is observed that fatal disease of the heart, primarily due to the pericarditis, almost always supervenes. In slight cases it is probable that a true cure, without adhesion, may take place.

Pericarditis frequently arises from exposure to cold when the body is warm and perspiring. It is no uncommon result of a contaminated state of the blood, such as occurs in the exanthematous diseases, especially scarlatina, and in Bright's disease of the kidney; but beyond all comparison, it is of most frequent occurrence in association with acute rheumatism (q.v.), of which it forms by far the most dangerous complication.

At the commencement of the disease, blood should be freely taken (if the patient is tolerably robust) from the region of the heart either by cupping or repeated leeching; and at the same time every attempt must be made to get the system under the influence of mercury to the extent of rendering the gums tender and of affecting the breath. Not only should calomel in small doses, and combined with opium with the view of preventing purging, be frequently given, but mercurial ointment should be rubbed into the arm-pits and inner sides of the thighs, and the mouth should be kept slightly sore for some time. After three or four days, if there should be much fluid effusion, a large blister should be applied over the heart; and if the patient is not already under the influence of mercury, the raw surface may be dressed with mercurial ointment. Perfect rest both of body and mind is of essential importance, and all possible causes of excitement should be excluded. The diet should be mild and chiefly farinaceous, and little or no animal food should be allowed till the beginning of convalescence. Cooling drinks are agreeable to the patient, and may be taken freely with advantage throughout the disease.

PERICAR'DIUM, The, is a conical membranous sac, containing the heart and the commencement of the great vessels, to the extent of about two inches from their origin. It is placed with its apex upwards behind the sternum, and to its left side, in the interval between the pleuræ—the serous sacs in which the lungs are inclosed; while its base is attached to the diaphragm. It is a fibro-serous membrane, consisting of an external fibrous and an internal serous layer. The fibrous layer is a strong, dense, fibrous membrane; the serous layer invests the heart, and is then reflected on the inner surface of the fibrous layer. Like all serous membranes, it is a closed sac; its inner surface is smooth and glistening, and secretes a thin fluid which serves to facilitate the natural movements of the heart. It is inflammation of this serous sac which constitutes the disease known as pericarditis.

PERICARP. See Fruit.

PERICLES (Gr. Perikles), the most accomplished statesman of ancient Greece, was b. of distinguished parentage in the early part of the 5th c. B.C. His father was that Xanthippus who won the victory over the Persians at Mycale, 479 B.C., and his mother, Agariste, was the niece of the great Athenian reformer Cleisthenes. Pericles received an elaborate education; but of all his teachers, the one whom he most reverenced, and from whose instructions he derived most benefit, was the philosopher Anaxagoras (q.v.). Pericles was conspicuous all through his career for the singular dignity of his manners, the "Olympian" thunder of his eloquence, his sagacity, probity, and profound Athenian

patriotism. When he entered on public life, Aristides had only recently died, Themistocles was an exile, and Cimon was fighting the battles of his country abroad. Although the family to which he belonged was good, it did not rank among the first in point of either wealth or influence, yet so transcendent were the abilities of Pericles, that he rapidly rose to the highest power in the state as the leader of the dominant democracy. The sincerity of his attachment to the "popular" party has been questioned, but without the shadow of evidence. At any rate, the measures which either personally or through his adherents he brought forward and caused to be passed, were always in favor of extending the privileges of the poorer class of the citizens. Pericles seems to have grasped very clearly, and to have held as firmly, the modern "radical" idea, that as the state is supported by the taxation of the body of the citizens, it must govern with a view to general and not to *caste* interests. In 461 B.C., Pericles, through the agency of his follower, Ephialtes, struck a great blow at the influence of the oligarchy, by causing the decree to be passed which deprived the areopagus of its most important political powers. Shortly after, the democracy obtained another triumph in the ostracism of Cimon. During the next few years the political course pursued by Pericles is not very clearly discernible, but in general his attitude was hostile to the desire for foreign conquest or territorial aggrandizement, so prevalent among his ambitious fellow-citizens. In 454 B.C., or shortly after, he magnanimously proposed the measure (which was carried) for the recall of Cimon, and about the same time commenced negotiations with the other Hellenic states with the view of forming a grand Hellenic confederation, the design of which was to put an end to the mutually destructive wars of kindred peoples —to make of Greece one mighty nation, fit to front the outlying world. The idea was not less sagacious than noble. Had it been accomplished, the semi-barbarous Macedonians would have menaced the civilized Greeks in vain, and even Rome at a later period might perhaps have found the Adriatic, and not the Euphrates, the limits of her empire. But the Spartan aristocrats were utterly incapable of morally appreciating such exalted patriotism, or of understanding the political necessity for it, and by their secret intrigues brought the well-planned scheme to naught. Athens and Sparta were already, and indeed had for some time been, in that mood towards each other which rendered the future Peloponnesian war inevitable. They are always found on opposite sides. When the Spartans, in 448 B.C., restored to the Delphians the guardianship of the temple and treasures of Delphi, of which they had been deprived by the Phocians, the Athenians immediately after marched an army thither, and reinstated the latter. Three years later, an insurrection broke out in the territories tributary to Athens, Megara, Eubœa, etc., and the Spartans again appeared in the field as the allies of the insurgents. The position of Athens was critical. Pericles wisely declined to fight against all his enemies at once. A bribe of ten talents sent the Spartans home, and the insurgents were then rapidly and thoroughly crushed.

Cimon was now dead, and was succeeded in the leadership of the aristocratic party by Thucydides, son of Milesias, who in 444 B.C. made a strong effort to overthrow the supremacy of Pericles by attacking him in the popular assembly for squandering the public money on buildings, and in festivals and amusements. Thucydides made an effective speech; but Pericles immediately rose and offered to execute the buildings at his own expense, if the citizens would allow him to put his own name upon them instead of theirs. The sarcasm was successful, and Pericles was empowered to do as he pleased in the matter. But Pericles did not mean to be simply sarcastic; he wished to point out to the Athenians in a delicate way the spirit and aim of his policy, which was to make Athens, as a city, worthy of being the head and crown of Hellas. His victory in the assembly was followed by the ostracism of Thucydides; and during the rest of his career "there was," says the historian Thucydides, "in name a democracy, but in reality a government in the hands of the first man." The same author, however, informs us that he never did anything unworthy of his high position; that he did not flatter the people, or oppress his adversaries; and that with all his unlimited command of the public purse, he was personally incorruptible. Soon after this the Samian war broke out, in which Pericles acquired high renown as a naval commander. This war originated in a quarrel between tne Milesians and Samians, in which Athens was led to take a part with the former. The Samians, after an obstinate struggle, were beaten, and a peace was concluded in 440 B.C. The position in which Athens then stood towards many of the Greek states was peculiar. Since the time of the Persian invasion she had been the leader of the confederacy formed to resist the attacks of the powerful enemy, and the guardian of the confederate treasury kept in the isle of Delos. Pericles got the treasury removed to Athens, and, commuting the contingents of the allies for money—Athens, of course, herself undertaking to protect the confederacy—enormously increased the contributions to the "patriotic fund." The grand charge against Pericles is, that he applied the money thus obtained to other purposes than those for which it was designed; that, in short, he adorned and enriched Athens with the spoils of the allied states. But the objection is more plausible than solid, for, in point of fact, Athens kept up in admirable discipline a great fleet and a fine army, and Pericles made the Greek name more respected in his time than it had ever been before. It may be that his conduct is open to criticism in some respects, but a broad and just view of the motives which impelled him to act as he did, and a fair consideration of the political exigences of the time will, in

the main, justify his procedure. It is unnecessary to give a detailed account of all that he did to make his native city the most glorious in the ancient world. Greek architecture and sculpture, under his patronage, reached perfection. To Pericles, Athens owed the Parthenon, the Propylæa, the Odeum, and numberless other public and sacred edifices; he also liberally encouraged music and the drama; and, during his rule, industry and commerce were in so flourishing a condition, that prosperity was universal in Attica.

At length in 431 B.C., the long-foreseen and inevitable "Peloponnesian war" broke out between Athens and Sparta. With the circumstances that led to it we have not here to do, but as it terminated most disastrously for Athens, it is but right to say that Pericles is not to blame for the result. Had the policy which he recommended been pursued, one can hardly doubt that Athens, with her immense resources, would have been the victor, and not the vanquished, in the struggle. Pericles himself died in the autumn of 429 B.C., after a lingering sickness. His character has been sufficiently delineated in the outline of his life which we have given. His connection with the brilliant Aspasia (q.v.) is noticed elsewhere.

PERIER, CASIMIR, a celebrated French statesman, was b. at Grenoble, in the department of Isere, France, Oct. 21, 1777. His father had enriched himself by mercantile and industrial pursuits, into which he initiated his two elder sons; but Casimir was still studying at the college of the oratory at Lyon when the revolution broke out. He immediately went to Paris, and there associated himself with his father and elder brother, Antoine-Scipion, in their endeavors to found a banking company. It is sufficient to notice here that the banking company was firmly established, and became the bank of France. Casimir was drafted into the army in 1798, and served in an engineering corps till 1801, when he returned to Paris, and resumed the position of coadjutor to his brother. The house of Perier prospered greatly under the empire; the peace which followed the events of 1815 aided the development of their plans, and gave a wider scope to their enterprises; and the public regarded with special favor men such as these two brothers, who devoted their abilities and fortunes to foster the growth of public, as well as their own, prosperity. In 1817 Perier published three tracts, in which he condemned the financial policy of the ministry. These papers made a lively impression on the public, and led to the return of the author to the chamber of deputies by the electors of Paris. Perier, in his political principles, was essentially a constitutionalist, equally far removed from absolutism on the one hand, and extreme democracy on the other. The elections of 1824, conducted under government influence, resulted in the ousting of the greater portion of the constitutionalists. Perier, however, and a few others of the chiefs of the party retained their seats; but their opposition to the ministerial measures, though constant and unwearying, was quite ineffective; it, however, raised them greatly in public opinion, and secured their re-election, in 1827. In this year Perier had the honor of being elected as representative by both the departments of the Seine and Aube. He defended the loyal and sagacious administration of M. de Martignac, whose representations to the king, Charles X., seemed to have the effect of reconciling the royal party to government in conformity with the charter; but the subsequent rule of the prince de Polignac reduced this hopeful state of affairs to its former critical condition. The revolution (of July, 1830), which Perier, from his experience of that of 1789, had made every endeavor to prevent, now followed, and it only remained for him to render it as bloodless as possible. In this he was successful, through his great influence with the people of Paris. On Aug. 3 he was elected president of the chamber of deputies, but resigned this office on the 11th of the same month to become a member of the ministry. When Laffitte became president of the council (Nov. 2), Perier, fearing that the tendencies of the ministry were too revolutionary, resigned office, and resumed the presidency of the chamber of deputies. On Mar. 13, 1831, he succeeded Laffitte as minister, and gave his whole attention to the repression of revolution, the maintenance of order at home and of peace abroad, originating the political system known as the *justemilieu* (q.v.). His foreign policy was very successful; he greatly contributed to the maintenance of Belgian independence, the suppression of the Miguelite insurrection in Portugal, the counterbalancing of Austrian influence in Italy, and, in general, to the spread and progress of constitutional liberty both at home and abroad; but the rapid growth of extreme liberalism in France, partly owing to previous encouragement unwittingly afforded by himself, was a source of great annoyance to him. On the outbreak of cholera in Paris, Mar., 1832, Perier made the most extraordinary exertions for the enforcement of the necessary sanatory measures; but he was attacked by the disease, and his system being already exhausted by over-exertion, he died May 16, 1832. No public man in France was ever so generally and sincerely lamented, and a monument to his memory was erected by public subscription in the cemetery of Père-la-Chaise.

PERIGEE (Gr. *peri*, near; *gē*, earth), that point in the moon's orbit which is nearest to the earth. The opposite point is the Apogee (q.v.). See MOON.

PÉRIGORD, an old division of S.W. France in Guienne, and now forming part of Dordogne and Gironde. During the reign of Henry IV., in the 8th c., it became a county, and was added to the crown; and at one time was divided into upper and lower Perigord. Perigueux and Sarlat were the capitals.

PÉRIGUEUX, a t. of France, capital of the department of Dordogne, and situated on the right bank of the Isle, 42 m. s.e. of Angoulême. It consists of the ancient city of Perigueux proper—which is gloomy in aspect, and has narrow streets, but large and solidly-built houses—and the *Puy St. Front,* which, until the year 1240, was a separate and a rival town. In the old town there are many curious remains of Gothic architecture. The old ramparts have been demolished, and replaced by beautiful and spacious boulevards. The cathedral of St. Front is a majestic edifice, restored at the end of the 15th century. Quarries of building-stone are worked in the vicinity, and many hands are employed in cutting and polishing marble. Paper, woolen cloths, cutlery, and hosiery are manufactured. The celebrated *Pâtés de Périgueux,* made of partridges and truffles, are largely made and exported. Pop. '91, 30,725.

Perigueux, a town of the highest antiquity, is the *Vesunna* mentioned by Cæsar. In ancient times it was a city of much importance. It stood at the junction of five Roman roads, and contained a number of splendid edifices. Close to the modern town are still to be seen the remains of a vast amphitheater, oval in form, and larger in its dimensions than the ancient amphitheater of Nîmes. There are also remains of ancient aqueducts, baths, and temples. The *Tour de Vésonne* is the most remarkable fragment of Roman architecture. It is still 67 ft. high, and appears to have been much higher; is 200 ft. in circumference, and has walls 6 ft. thick. It has neither doors nor windows. Its purpose is not known.

PERIHE'LION (Gr. *peri,* and *hēlios,* the sun), that point in its orbit at which a planet is nearest the sun. The point of the orbit opposite to it is called the Aphelion (q.v.). The position of the perihelion, i.e., its longitude e. or w. of the equinox, is one of the seven elements of a planet's orbit.

PERIM', a small island belonging to Great Britain, situated in the strait of Bab-el-Mandeb, at the entrance to the Red sea; lat. 12° 40′ 30″ n., long. 43° 23′ east. Perim is level, and is slightly elevated above the sea, and is 3½ m. long; is 1½ m. from the Arabian, and 10 m. from the African coast. Pop. '91, 151. On both sides of this island the navigation is easy; the little strait, between the island and Arabia, is the passage most generally taken by vessels. The island is bare, destitute of fresh water, and ill-furnished with provisions, which are brought for the most part from Aden. Perim owes its importance wholly to its commanding position at the entrance of the Red sea. On its s.w. side is an excellent harbor, capable of accommodating 40 men-of-war, within 100 yards from the shore. There is a walled lighthouse on the island. Fortifications were erected on the island in 1857, but, with the temporary arsenal, etc., were subsequently removed again. It was captured by sir David Baird, and then occupied by the English in 1799, and held by them as a check upon the designs of the French, who were then in Egypt. It was abandoned in 1801, but was re-occupied by Great Britain in 1857, with a view to the protection of her Indian possessions, which were thought to be exposed to some chance of danger from the opening of the Suez canal (q.v.).

PERIMETER (Gr. *peri,* around, *metron,* a measure) and PERIPHERY (Gr. *phero,* I carry) are terms denoting the boundary, or the length of the boundary, of any closed plane figure; though the term "perimeter" is generally confined to those figures which are bounded by straight lines.

PERINÆUM. The part of the human body which forms the floor of the true pelvis is by anatomists divided into two portions. Of these, the anterior one, situated in front of the anus, is called the *true perinæum,* or urethral portion of the perinæum; the posterior portion, which contains the anus or termination of the rectum, is called the ischio-rectal region, or anal portion of the perinæum. The anterior portion, or true perinæum, is triangular in form, the apex being in front; the sides, about 3 in. in length, are formed by the rami of the pubes and ischium; and the base by an imaginary line joining the tuberosities of the ischium, and passing about half an inch in front of the anus. Through this space the uretha passes through a layer of strong fascia—the deep perinæal fascia—to communicate with the bladder, and in this space the opening is made in the operation of lithotomy.

PE'RIOD, a term used in chronology in the same sense as cycle (q.v.), to denote an interval of time after which the astronomical phenomena to which it refers recur in the same order. It is also employed to signify a cycle of cycles. Various periods have been invented by astronomers, but we can only notice a few of the most important.

The Chaldeans invented the *Chaldaic Period,* or *Period of Eclipses,* from observing that, after a certain number of revolutions of the moon round the earth, her eclipses recurred in the same order and of the same magnitude. This period consists of 223 lunations, or 6,798.28 days, and corresponds almost exactly to a complete revolution of the moon's node. The Egyptians made use of the *Dog-star, Siriacal,* or *Sothric Period,* as it is variously called, to compare their civil year of 365 days with the true or Julian year of 365¼ days. The period consequently consisted of 1460 Julian years, corresponding to 1461 Egyptian years, after the lapse of which the dates in both reckonings coincided. By comparing the solar and lunar years, Meton, an Athenian, invented (432 B.C.) a lunar period of 6,940 days, called from him the *Metonic Cycle* (q.v.), also the *Lunar Cycle.* About a century afterwards, the cycle of Meton was discovered to be an insuffi-

cient approximation to the truth, and as he had made the solar year too long by about $\frac{1}{76}$th of a day, at the end of 4 Metonic cycles the solar reckoning was in advance of the lunar by about 1 day 6 hours. To remedy this, a new period, called the *Calippic Period*, was invented by Calippus, and consisted of 4 Metonic cycles less by 1 day, or 27,759 days. But as this period still gave a difference of 6 hours between the solar and lunar reckonings, it was improved by Hipparchus, who invented the *Hipparchic Period* of 4 Calippic periods less by 1 day, or 111,035 days, or about 304 Julian years, which is an exceedingly close approximation, being only $6\frac{1}{2}$ minutes too long, when measured by the tropical year; and too short but by an almost inappreciable quantity, when measured by the *Synodic Month* (see MONTH). The *period of the Heliacal* or *Solar Cycle*, after which the same day of the month falls upon the same day of the week, consists of 28 Julian years. If the year had regularly consisted of 365 days, that is, one day more than an exact number of weeks, it is evident that, at the end of seven years, the days of the month and week would again correspond; but the introduction of an intercalary day into every fourth year causes this coincidence to recur at irregular periods of 6, 11, 6, and 5 years successively. However, by chosing a period such as will preserve the leap-years in the same relative position to the other years, and at the same time consist of an exact number of weeks (both of which objects are effected by using the number 28, which is the least common multiple of 4 and 7), we insure the *regular* recurrence of the coincidence between the days of the week and of the month. The solar cycle is supposed to have been invented about the time of the council of Nice (325 A.D.), but it is arranged so that the first year of the first cycle corresponds to 9 B.C. In calculating the position of any year in the solar cycle, care must be taken to allow for the omission of the intercalary day at the beginning of each century, and its insertion in the first year of every fourth century. See LEAP-YEAR. The year 1880 is the 13th of the solar cycle. The *Julian Period* is a cycle of cycles, and consists of 7,980 (=28×19×15) years, after the lapse of which the solar cycle, lunar cycle, and the indiction (q.v.) commence together. The period of its commencement has been arranged so that it will expire at the same time as the other three periods from which it has been derived. The year 4713 B.C. is taken as the first year of the first period, consequently, 1 A.D. was the 4714th of it, and the year 1885 was the 6598th. See CHRONOLOGY.

PERIODICAL, a publication which appears continuously at regular intervals, and whose contents may be devoted to criticism, politics, religion, literature, science, arts, amusement, or general and miscellaneous subjects. Those periodicals which consist of a collection of critical essays are called reviews.

The earliest periodical in Great Britain seems to have been the *Philosophical Transactions of the Royal Society*, which first appeared in 1665, and contained notices of books as well as original papers. Periodicals professing to notice the books that were being published appeared soon after from time to time under the name of *All the Works of the Learned;* and in 1692 appeared the *Gentlemen's Journal, or Monthly Miscellany*, properly speaking, the first English magazine. The *Gentleman's Magazine* was founded in 1731 by Cave the printer, a periodical which secured a fortune for its proprietor, and, after surviving all its competitors, still exists, though lately somewhat assimilated in form to the new class of magazines. The periodical literature of Scotland was long represented by the *Scots Magazine*, founded in 1739. The first English periodical that attempted anything like criticism was the *Monthly Review*, begun in 1749. It was followed in 1756 by the *Critical Review*, founded by Smollett; and these two were long the leading periodicals of their class, though their criticism was but meager and unsatisfactory, according to our present notions. Another critical journal, called the *Anti-Jacobin*, was established in 1798. In 1802 a new era in criticism was inaugurated by the establishment in Scotland of the *Edinburgh Review* (q.v.); which was followed in London by the *Quarterly Review*, of about equal merit and opposite politics, supported by sir Walter Scott, Southey, S. T. Coleridge, Heber, and at a later period by Hartley Coleridge, lord Mahon, and Gladstone. Another very important periodical, *Blackwood's Magazine*, sprung up in Edinburgh in 1817, under the auspices of John Wilson and Lockhart, as much above the literary mark of former magazines, as the *Edinburgh* and *Quarterly* were above the mark of preceding reviews, strongly devoted to the interests of conservatism, and, in its early years, somewhat violent in its politics. The review, in the course of time, became the favorite medium for all parties to disseminate their views on political, literary, or theological subjects. Of various reviews after the model of the *Edinburgh* and *Quarterly*, and published, like them, four times in the year, some, as the *North British Review* and *National Review*, after having had a flourishing existence for some time, succumbed to the demand for cheaper periodicals, appearing at more frequent intervals. Among existing reviews appearing quarterly may be mentioned the *Edinburgh* and *Quarterly*, which are still among our foremost periodicals; the *Westminster Review*, established 1824, characterized by freedom in handling philosophical and theological topics, and containing essays by J. S. Mill, Carlyle, Grote, John Sterling, and lord Houghton; and the *Dublin Review*, Roman Catholic, founded in 1836. Many of the newer reviews appear monthly. Of these, the *Contemporary Review* and the *Nineteenth Century* are both very ably conducted; so is also the *Fortnightly Review* (at first published twice a month), considered the organ

of the very advanced liberal party. There are also weekly reviews, which unite with the review more or less of the character of a newspaper: of these, the most widely circulated and influential are the *Athenæum*, established in 1828, the *Saturday Review*, in 1856; and the *Academy*, in 1869, at first published monthly. Other more or less recently established reviews are *Nature* (1869), a weekly (illustrated) journal devoted to the interests of natural science; the *Popular Science Review* (quarterly); and *Mind* (quarterly), established in 1876, and devoted to mental science. The articles in the older reviews are generally anonymous; in the newer, it has become to a large extent the practice for the authors to adhibit their names.

The greater part of magazines or periodicals of a more miscellaneous character appear monthly, and their system of management is somewhat similar to that of reviews; but the articles are generally shorter, the subjects more varied, consisting often of tales and novels, which appear there as serials, continued from number to number. Some of the most popular novels of the present day have first been published in magazines. *Blackwood* was the precursor of various monthly magazines of repute, the most important being *Fraser's Magazine*, published 1830–82, which maintained a high literary character. The usual price of these periodicals is 2s. 6d.; but in 1859–60, several new magazines, *Macmillan's Magazine*, the *Cornhill*, *Temple Bar*, *London Society*, and the *St. James's Magazine*, were started at the cheaper price of a shilling, under favorable auspices, and the number of these shilling magazines is increasing. In Great Britain, there are now many weekly periodicals, chiefly of an instructive and amusing kind, price from a penny to threepence each. This class of publications received an impetus and proper direction by the issue of *Chambers's Journal* and the *Penny Magazine* of the "Society for the Diffusion of Useful Knowledge" in 1832. It is customary for the publishers of these weekly sheets to issue them accumulatively in parts monthly under a cover, wherefore they largely answer the purpose of monthly magazines. The rate of payment for writing in the higher class reviews is usually £10, 10s. per sheet of 16 demy 8vo pages; in the weekly periodicals, half a guinea to a guinea per column is ordinarily paid, but in some instances the price paid is very much greater; such particularly is the case as regards novels.

The quarterly reviews, and the magazines in course of weekly or monthly publication, number about 1,100, and of these above 300 are denominational or religious. Of this number only about 12 are, strictly speaking, reviews.

France possessed as far back as 1665 a critical review called the *Journal des Savants*, which, after a lengthened interruption, began again in 1816, and holds a respectable position as a scientific journal. A number of literary and scientific journals sprung up in last century, as the *Nouveau Journal des Savants*, *Journal Littéraire*, *Journal Encyclopédique*, etc. Among the best was the *Magazin Encyclopédique*, begun in 1795, and from 1819 to 1835, combined with the *Revue Encyclopédique*. One of the most noted critical journals in Europe is published in Paris, the *Revue des Deux Mondes*, which began in 1829, and has, since 1831, appeared fortnightly. In it and the other French periodicals of the same kind, the review form is not so completely preserved as with us: a proportion of tales, poetry, etc., is admitted, and the names of the contributors are required to be attached to their articles. The *Revue des Deux Mondes* has had many shortlived imitators, more or less identified with different political parties. The principal French reviews of more recent date are the *Revue Contemporaine*, *Athenæum Française*, *Revue d'Europe*.

In Germany, reviews have taken even a deeper root than in England. The *Göttinger Gelehrte Anzeigen*, which is the oldest publication of the kind, still preserves a high character. German criticism can, however, hardly be said to have begun before the time of Lessing, who, in conjunction with Nicolai of Berlin, established in 1757, the *Bibliothek der schönen Wissenschaften*, and afterwards various other journals, characterized by an independence of thought unknown before. The *Allgemeine Literaturzeitung*, founded at Jena in 1785, was a periodical of a still higher character, having for contributors the most eminent literary men of the period. When transferred from Jena to Halle, another journal, called the *Jenaische Allgemeine Literaturzeitung*, sprung up at the former place, under the auspices of the celebrated literary circle at Weimar, of whom Goethe was the center. These two periodicals existed till 1848. Of modern German reviews, the *Deutsche Rundschau* and the *Literarisches Centralblatt* are specimens of two different types, The *Deutsches Museum*, the *Gartenlaube* (the most widely read of German periodicals, with a circulation of nearly 400,000), and *Im Neuen Reich*, are rather magazines than reviews.

Italy possessed a critical journal, *Giornale dei Litterati*, as far back as 1710, conducted by Apostolo Zeno, which continued for 23 years. A new journal of the same name, founded at Pisa in 1771, attained considerable repute. From 1826 to 1830, the *Biblioteca Italiana* and *Antologia di Firenze*, were reviews of considerable ability. The scientific periodicals of Italy are generally creditable. More than 30 periodicals are now published in Rome alone, the number having rapidly increased since the events of 1870.

As is well known, the first attempt to establish a periodical in the United States was made in 1741, when Franklin issued his *General Magazine and Historical Chronicle* at Philadelphia. This periodical lasted but half a year, and the *American Magazine*, which was started soon afterward, suspended after the second number. Other periodicals published before the revolution were: the *American Magazine and Historical Chronicle*

(1743–46); the *Boston Weekly Museum* (1743, 4 numbers); the *Independent Reflector* (1752–54); the *New England Magazine* (1758); the *American Magazine* (1757–58); the *North American Magazine* (1758–66); the *American Magazine* (1769); the *Royal American Magazine* (1774–75); and the *Pennsylvania Magazine* (1775); the *Knickerbocker*, founded by C. F. Hoffman at New York in 1832, and continued till 1862, and *Putnam's Monthly*, issued in the same city from 1853 to 1857 and from 1867 to 1869, were popular American magazines. The best known magazines published in the United States at the present time are the *Atlantic Monthly*, founded in Boston in 1857, and edited successively by J. R. Lowell, J. T. Fields, W. D. Howells, and T. B. Aldrich; *Harper's New Monthly Magazine*, founded in New York in 1850, edited by Henry M. Alden; *Century* (monthly), founded in New York in 1870 (long edited as *Scribner's Monthly*), by Dr. J. G. Holland, now by R. W. Gilder; and *Lippincott's Magazine*, Philadelphia. The *Eclectic Magazine*, *Littell's Living Age*, and the *Library Magazine*, are principally devoted to reprints from foreign periodicals. The *North American Review*, founded in Boston in 1815, and the *International Review*, begun at New York in 1874, are of a graver character. *St. Nicholas* and *Wide Awake* are popular magazines for children. W. F. Poole publishes from time to time new editions of his *Index to Periodical Literature*, giving full lists of the titles of articles that have appeared in English and American periodicals to the present time.

Perhaps the most remarkable development in the periodical literature of America during the last decade has been in illustrations. *Harper's Monthly* and *The Century* (the name assumed by *Scribner's Magazine* in 1881, Nov.) have vied with each other in bringing the art of wood-engraving to a technical perfection never reached before. While this has largely increased the cost of publication, it has also swelled their subscription lists to unprecedented dimensions. Both magazines have a large circulation in Great Britain as well as in the U. S., the Harpers publishing an edition there which is expressly prepared for the market by an English editor. The only British periodical approaching in circulation these American monthlies is Macmillan's *English Illustrated Magazine*, founded in 1884, Feb.; but its subscription price is less than half that of its rivals, and consequently neither in the quantity nor in the quality of its illustrations does it attempt to compete with them. Two short-lived American periodicals, which started with great expectations, that were apparently warranted by their intrinsic merits, were *The Continent* and *The Manhattan*. The latter was founded in New York, 1883, Jan., and expired in less than two years. The former made a far harder struggle for existence. It was started at Philadelphia, in 1879, by the Continent Publishing Co., with Albion W. Tourgée as its editor; was then transferred to New York, and came to a sudden close, 1884. In 1887 the firm of Charles Scribner's Sons began the publication of *Scribner's Magazine*, a new enterprise. See MAGAZINES.

PERIODICITY (in physiology and pathology). The tendency manifested by various phenomena occurring in living animals to recur, after equal, or nearly equal intervals of time, is so marked, that Bichat, the great French anatomist and physiologist, described it under the title of the *Loi d'Intermittence*. The alternation of sleep and waking, the phenomena of menstruation, and the punctual return of hunger, are some of the most obvious instances of periodicity that can be suggested as occurring in the healthy subject; while less obvious examples are afforded by the apparently regular variations that have been observed in the excretion of carbonic acid from the lungs, and in the number of the pulsations of the heart at different periods of the 24 hours. As is well known by experience, periodicity may be usefully cultivated and fixed in daily habits. This is well exemplified in the case of sleep, but in a more special degree by the daily relieving of the bowels at a particular hour, a habit in which it is important that all young persons should be carefully instructed with a view to health and convenience.

In certain forms of disease, the law of periodicity or intermission is very distinctly seen. The regular periodic recurrence of the paroxysms of intermittent fever (or ague), is universally known, although the cause of the periodicity has hitherto baffled all inquiry.

Ague often gives rise to periodic diseases which present no close analogy to that disease. Thus it—or, at all events, malaria—is a frequent cause of tic douloureux, recurring at regular intervals; cases are recorded in which periodical vomiting, occurring weekly, or, in one case, at an interval of ten days, seemed to be due to it; and Mr. Moore, surgeon to the Middlesex hospital, not long ago published the case of a woman who experienced a periodical inflammatory swelling of the right knee, as a sequence of that disorder. Epilepsy is a disease in which the intervals (especially in women) tend to a regular period. Sir Henry Holland (*Medical Notes and Reflections*, 2d ed., page 341) records a case in which "six attacks occurred, with intervals of 16 or 18 minutes between; so exactly recurring, as noted by the watch, that it was impossible to suppose it a mere casuality;" and another, "where a spasmodic seizure, more of tetanic than epileptic character, occurred twice a day for many weeks successively, and almost exactly at the same hours each day." For many other examples of periodic or intermittent morbid action, the reader is referred to a memoir by Henle, "On the Course and Periodicity of Disease," in his *Pathologische Untersuchungen;* and to sir Henry Holland's essay (to which we have already referred) in his *Medical Notes and Reflections*. The most important practical fact in relation to this class of diseases is, that they almost invariably yield to the action of certain medicines, especially bark and arsenic.

Exercising a beneficial or mischievous influence, as the case may be, the habit of periodicity is to be seduously shunned in every instance likely to prove morally or physically prejudicial. No more marked example of the injudicious cultivation of periodicity could be given than in the evil practice of periodical blood-letting, which once prevailed all over Europe, and was only abandoned in recent times as not only useless, but in all respects injurious.

PERIŒ'CI (Gr. *Perioikoi*, literally, "dwellers round about," i.e., round about some particular locality or city) was the name given, in ancient Greece, to the original Achaian inhabitants of Laconia by their Dorian conquerors. The Periœci were not slaves, like the Helots (q.v.); they were merely a vassal population, personally free, cultivating their own ground, and carrying on most of the home and foreign trade of Laconia, but possessing no political rights, incapable of intermarrying with the Dorians of Sparta, or of holding important state-offices, and subjected to a land-tax in token of their dependent condition. They have been—as regards their political position—compared to the Saxons of England after the Norman conquest, and seldom has a historical parallel been so sound. The Periœci must have been very numerous, for they occupied at one time upwards of 100 cities, several of which were on the coast, whence the whole seaboard of Laconia bore the name of the *Perioikois*, and they produced capital sailors, which doubtless accounts for the anomalous fact of Periœci being occasionally invested with the command of the Spartan fleet. They also formed a part of the Spartan army. At the battle of Platæa (479 B.C.), there were 10,000 Periœci present. These dependent Achaians were not, however, all on a dead level of vassalage; they lived in regularly organized communities, where the social distinctions of rank, refinement, and wealth, were as marked as elsewhere. Xenophon speaks of "accomplished and well-born gentlemen" (*kaloi k'agathoi*) among the Periœci serving as volunteers in the Spartan army; and such artists and men of culture as Lacedæmon produced in all probability belonged to this class. Periœci also existed in the other Dorian communities of the Peloponnesus.

PERIOS'TEUM (Gr. *peri*, around, and *osteon*, bone), a tough fibrous membrane which surrounds the various bones. It is highly vascular, and is the means by which the outer layers of the shafts and the greater part of the spongy portions of the bones are supplied with blood. "From the internal surface of the periosteum also is produced a layer of soft blastema (or plastic fluid in which cells are developed), by means of which additions are made to the exterior of the growing bones. The process of ossification going on in the inner part of this blastema contributes to the thickness of the bone, while a fresh supply is continually being added to the exterior of the blastema, through the medium of the vessels of the periosteum."—Humphry, *On the Human Skeleton*, page 19. In young bones this membrane is thick, and in consequence of the intervening blastema is very easily detached from the bone; but in the bones of the adult it is less thick and vascular, while its connection with the bone becomes closer, in consequence of the blastema being less; while in aged persons it is very thin, its vessels are scanty, and there is no blastema. Numerous experiments show that the formation of bone is essentially due to the action of this membrane; and that, by transplanting detached portions of periosteum into muscular or other tissues, bony tissue is generated in those parts. In most cases in which this membrane has become detached in consequence of a wound or of disease, the exposed bone (except in the instance of the skull, which derives most of its nutrient matter from the dura mater) perishes; but this is not invariably the case. Amongst its other offices, it serves, by isolating the bone from the surrounding tissues, to prevent the spread of disease from them to it. The shin-bone, or tibia, is thus indebted to the periosteum for its ordinary immunity, in cases of ulcer in that region.

PERIOSTI'TIS, or INFLAMMATION OF THE PERIOSTEUM, generally occurs on the surface of thinly-covered bones, such as the tibia, clavicles, and cranial bones. Its chief causes are (1) a *syphilitic taint*, in which oval swellings, called *nodes* (q.v.), are produced; (2) *rheumatism*; and (3) *scrofula*. In the two latter cases there is a periosteal swelling around the whole circumference or surface of the bone. The affection, especially when due to the first or second of the above causes, is usually accompanied with considerable nocturnal pain. If the disease occurs in an acute form, it must be treated with leeches, fomentations, and the other ordinary antiphlogistic (or lowering) remedies. When it becomes chronic, the treatment must be mainly directed to the cause which has originated it. In almost all cases, the nocturnal pains are best relieved by somewhat large doses (five to ten grains) of iodide of potassium, taken three times a day on an empty stomach.

PERIPATET'IC PHILOSOPHY, a designation of the philosophy of Aristotle (q.v.) and of his followers. It is of doubtful origin, being supposed to have been derived either from his custom of occasionally walking about (*peripatein*) during the delivery of his lectures, or from the place in which they were delivered having been a shaded walk of the lyceum.

PERIPNEUMO'NIA, an inflammation of the membrane which invests the lungs, accompanied with general disturbance of the whole system; remarkably prevalent among horses in south Africa, in a zone from 20° to 27° s. lat. It is very fatal; and to its prevalence and virulence Dr. Livingstone is disposed to ascribe the fact that horses, although so

abundant in the more northern parts of Africa, were unknown in the south till introduced by Europeans; this invisible barrier being more insurmountable than mountain ranges, deserts, or rivers. The season during which peripneumonia prevails is from December to April. Zebras, antelopes, and oxen are liable to its attacks, but no kind of quadruped suffers so much from it as the horse. The flesh of animals which die of peripneumonia is unwholesome, and produces a malignant carbuncle in persons who eat it.

PERIP'TERAL (Gr. *peri;* and *pteron*, a wing), a term applied to temples or like buildings having columns all round the cella.

PERISSODAC'TYLA, a section of the order *ungulata* (q.v.), including the horse (q.v.), rhinoceros (q.v.), and the tapir (q.v.).

PERISTAL'TIC MOTION. The terms *peristaltic* (Gr. *clasping and compressing*) and *vermicular* (or worm-like) are applied to the peculiar motion or action of the muscular coat of the intestines, by which the substances contained within it are regularly moved onward.

This action of the intestines is readily seen on opening an animal (a dog, cat, or rabbit, for example) immediately after it has been killed; and in these circumstances it is perhaps exaggerated, from the stimulating action of the cold air; and it may be shown in an abnormally active state, although not altered in character, by subjecting the exposed intestines to the influence of the electro-magnetic machine.

It appears, from the observations made by Brinton, Todd, and Bowman, and others, on recently killed animals, that the peristaltic motion commences at the pyloric third of the stomach (see DIGESTION, ORGANS OF,), whence successive waves of contraction and relaxation are propagated downwards throughout the whole length of the intestinal canal. "In examining a portion of intestine at the moment of its contraction, we perceive a dilatation above it as well as below it; the latter being produced by the protrusion into it of the contents of the now contracted portion of intestine; the former by the relaxation of a previously contracted portion. The rapid succession of these contractions and relaxations gives to the movements of the intestines the appearance of the writhings of a worm, whence they are distinguished by the appellation *vermicular*."—Todd and Bowman's *Physical Anatomy of Man*, vol. ii. p. 236. These movements can occasionally be observed during life in the human subject, indirectly, in cases of extreme attenuation of the abdominal walls, and directly in wounds of the abdomen, and during certain surgical operations. There are differences of opinion as to the cause of the peristaltic action; thus Todd and Bowman assert that "the intestinal movements are partly due to the influence of the stimulus of distention upon the muscular tissue, and partly to the reflex action of the ganglia of the intestinal portion of the sympathetic, stimulated by the contact of the intestinal contents with the mucous membrane;" while Carpenter maintains that "the intestinal tube from the stomach to the rectum is not dependent upon the nervous centers either for its contractility or for its power of exercising it, but is enabled to propel its contents by its own inherent powers."

Numerous observations tend to show that this motion has a nearly definite velocity in each individual. Most commonly the act of defecation takes place with perfect regularity every 24 or (more rarely) every 12 hours, the quantity discharged being almost constant if the mode of living does not vary. Heberden (*Commentarii*, p 14) mentions a person who regularly had a motion once a month, and (by way of contrast) another who had twelve motions every day during thirty years, and then seven every day for seven years, and rather grew fat than otherwise. Ponteau (*Œuvres Posthumes*, tome i. p. 27) records the case of a young lady who had no stool for upwards of eight years, although during the last year she ate abundantly of fruit, and drank coffee, milk, and tea, and broth with yelk of eggs; but she had copious greasy sweats. Such a case as this is possible, but far from probable.

That the influence of *expectant attention* on the muscular movements of the intestine (and especially of its lower portion) is very great is shown in various ways. It is, for the most part, thus that *habit* operates in producing a readiness for defecation at one special hour in the day, and that bread-pills and other equally inert substances act on the bowels, if the patient believes them to be purgatives. Dr. Carpenter, in his remarks on "the influence of expectant attention on muscular movements," in the chapter of his *Human Physiology* treating "of muscular movements," mentions two very striking cases of the kind which have fallen within his own knowledge.

PERISTE'RIA. See HOLY SPIRIT PLANT.

PERISTYLE, a colonnade around the interior of a court-yard or other building.

PERITONE'UM (Gr. *periteinein*, to extend around), a serous membrane, and, like all membranes of this class, a shut sac, which, however, in the female, is not completely closed, as the Fallopian tubes communicate with it by their free extremities. The peritoneum more or less completely invests all the viscera lying in the abdominal and pelvic cavities, and is then reflected upon the walls of the abdomen, so that there is a visceral and a parietal layer. Numerous folds are formed by the visceral layer as it passes from one organ to another. They serve to hold the parts in position, and at the same time enclose vessels and nerves. Some of these folds are termed *ligaments*, from their serving

to support the organs. Thus we have ligaments of the liver, spleen, bladder, and uterus formed by peritoneal folds. Others are termed *mesenteries* (from the Gr. *meson*, the middle, and *enteron*, the intestine), and connect the intestines with the vertebral column. They are the mesentery proper (q.v.), which has been already described, the ascending transverse, and descending meso-colon, and the meso-rectum. Lastly, there are folds called *omenta*, which proceed from one viscus to another. They are three in number—viz., the *lesser* or *gastro-hepatic omentum*, which extends from the under-surface of the liver to the lesser curvature of the stomach; the *gastro-splenic omentum;* and the *great* (or *gastro-colic*) *omentum*, which consists of four layers of peritoneum, the two which descend from the stomach, and the same two returning upon themselves, and ascending as high as the transverse colon, where they separate, and inclose that organ. These separate layers may be easily seen in the young subject, but in the adult they are more or less blended. The great omentum always contains some adipose tissue, which, in persons inclined to corpulency, often accumulates to an enormous extent. Its use appears to be (1) to protect the intestines from cold by covering them anteriorly as with an apron, and (2) to facilitate their movement upon each other during their vermicular action.

Like all the serous membranes, the peritoneum readily takes on inflammation from various exciting causes. This inflammation is termed peritonitis (q.v.).

PERITONI'TIS, or Inflammation of the Peritoneum, may be either an acute or a chronic disease.

Acute peritonitis generally presents well-marked symptoms. It sometimes commences with a chill, but severe pain in the abdomen is usually the first symptom. The pain is at first sometimes confined to particular spots (usually in the lower part of the abdomen), but it soon extends over the whole abdominal region. It is increased, on pressure, to such an extent that the patient cannot even bear the weight of the bedclothes; and to avoid, as far as possible, internal pressure upon the peritoneum, he lies perfectly still, on his back, with the legs drawn up, and breathes by means of the ribs, in consequence of the pain occasioned by the descent of the diaphragm in inspiration. The breathing is naturally shallow in these cases, and, less air being admitted at each movement of respiration, the number of those movements is increased. There are perhaps 40 or even 60 respirations executed in a minute, instead of 18 or 20. The pulse is usually very frequent, often 120 or more in the minute, and small and tense, though occasionally strong and full at the commencement of the attack. After the disease has continued for a certain time, the belly becomes tense and swollen, the enlargement being caused at first by flatus, and afterward also by the effusion of fluid, as may be ascertained by percussion and auscultation.

The progress of the disease is in general rapid. In fatal cases, death usually takes place within a week, and often sooner. The symptoms indicating that the disease is advancing towards a fatal termination are great distention of the abdomen, a very frequent and feeble pulse, a pinched and extremely anxious appearance of the face, and cold sweats.

Peritonitis may arise from any of the ordinary causes of inflammation, such as sudden change of temperature (especially the combined effects of cold and wet on the surface of the body), excessive use of stimulating fluids, the suppression of long-standing discharges, translation of gout and rheumatism, etc. It is frequently the result of local violence, and of wounds penetrating the peritoneal sac, including various surgical operations. Besides the above causes, there are two which give rise to special varieties of peritonitis, viz., contagion or infection, which often prevails epidemically, and produces great mortality amongst women after childbirth, giving rise to puerperal peritonitis, one of the most perilous accompaniments of the awful disorder known as puerperal fever (q.v.); and perforation of the stomach, bowels, gall bladder, urinary bladder, etc., by which their contents are allowed to escape into the peritoneal cavity, where they excite the most violent inflammation. *Peritonitis* from *perforation* is characterized by the suddenness of the attack, intense pain, incapable of mitigation by medicine, all at once arising in some part of the abdomen, the whole of which soon becomes tender in every part. This form of the disease is generally fatal, death usually ensuing within two days, and sometimes within a few hours. Perforation of the small intestine, in consequence of ulceration of the glands, is of not uncommon occurrence in continued (typhoid) fever, and sometimes occurs in phthisis. That apparently useless structure, the vermiform appendage of the cæcum, is a comparatively frequent seat of perforation. Sometimes it is the stomach which is perforated, and in these cases the patients are usually unmarried women (especially domestic servants), who had previously appeared in good health, or at most had complained of slight dyspepsia.

The only disease with which peritonitis is likely to be confounded by the well-educated practitioner is a peculiar form of hysteria; but the age and sex of the patient, the presence of hysteria in other forms, and the general history of the patient and of her symptoms, will almost always lead to a correct diagnosis of the disease.

The treatment, in an ordinary case of peritonitis (not arising from mechanical injury, or perforation from disease; or occurring in connection with puerperal fever), consists, if the patient is moderately robust, in bleeding from the arm, till a decided impression

has been made on the circulation; after which the abdomen should be covered with 20 or 30 leeches, and the bleeding from their bites should be encouraged by fomenting the belly with flannels wrung out of hot water, or, if the patient can bear its weight, by the application of a light poultice. The system must, at the same time, be got as speedily as possible under the influence of mercury, by the means described in the treatment of pericarditis (q.v.). Opium may be given freely, not merely to guard against the purgative action of the calomel, but with the view of securing sleep to the patient, and quiet to the inflamed membrane. The patient must be kept on low diet, unless indications of sinking appear. In peritonitis from perforation the only remedy is opium, which must be given in large and repeated doses, so as to keep the bowels perfectly at rest, in order to promote the formation of adhesion, by which alone the patient can be possibly saved. For the same reason, perfect rest must also be insisted on, and even drinks forbidden, thirst being allayed by the application of ice to the tongue.

Chronic peritonitis occurs in two forms, which differ in their origin and degree of fatality, but are very similar in their symptoms. In the first the inflammation is of the ordinary character, and, although the disease sometimes originates spontaneously, it is more frequently the sequel of an imperfectly cured acute attack; in the second, it depends upon granules (supposed by Louis and most writers to be tubercles) lying in countless numbers in the serous membrane, and serving as a constant source of irritation. The second form is confined almost, if not entirely, to persons of a scrofulous constitution.

The symptoms of chronic peritonitis are more obscure than those of the acute form. There is abdominal pain, often slight, and not always constant, which is increased by pressure, or sometimes is felt only when pressure is made. The patient complains of a sensation of fullness and tension of the belly, although its size is not visibly increased; of a loss of appetite; and of nausea and vomiting; and the bowels are usually more or less out of order. After a time, the abdomen enlarges, and becomes tympanitic, or more or less filled with fluid; and death gradually ensues from debility and emaciation, unless the fatal issue is accelerated by an acute inflammatory attack.

It is not always easy to determine, during life, whether the disease belongs to the first or second form. When its origin cannot be traced to a preceding acute attack, to local abdominal injury, or to chronic affections of the abdominal viscera, there is strong reason to believe it to be of the granular, or, as it is commonly called, the tubercular form, especially if the general constitution and the hereditary tendencies of the patient point in the same direction.

Little can be done in the way of treatment, especially in the tubercular form, further than mitigating the most distressing symptoms, and possibly retarding the final issue. The frequent application of a few leeches to the abdomen, followed by warm poultices, occasional blisters, attention to the bowels, which, if costive, should be acted upon by gentle laxatives, and a mild, nourishing, but unstimulating diet, are more likely to be of service than remedies of a more energetic nature.

PERITYPHLITIS. An inflammation of the loose connecting tissue attaching the cæcum and ascending colon to the iliac fascia. See CÆCUM; COLON; VERMIFORM APPENDIX.

PERIWINKLE, *Littorina*, a genus of gasteropodous mollusks of the order *pectinobranchiata* and family *littorinidæ*, having a proboscis-shaped head, a foot of moderate size, a single gill, and a rudimentary siphonal canal; the shell turbinate, thick, with few whorls, and no nacreous lining, the operculum of few whorls. A very well-known species is the COMMON PERIWINKLE (*L. littorea*), a snail-like mollusk most abundant on rocky parts of the British coasts, living in the lowest zone of sea-weeds between tide-marks, and feeding on fuci, etc. It is oviparous. No mollusk is more generally collected and used for food. Children are generally employed in collecting it. It is boiled in the shell, and so sold, often on the streets, and chiefly to the poorer classes, although few mollusks are more pleasant. It is calculated that 1900 tons, value £15,000, are annually consumed in London alone. It is called *wilk, wulk,* or *whulk* in Scotland, but is quite different from the *whelk* (q.v.) of the English.

PERIWINKLE, *Vinca*, a genus of plants of the natural order *apocynaceæ*, having a 5-cleft calyx, and a salver-shaped corolla, bearded at the throat, with five obliquely truncated segments. The leaves are opposite and evergreen; the flowers grow singly or in pairs from the axils of the leaves. The LESSER PERIWINKLE (*V. minor*), a native of many parts of Europe, and of the southern parts of Britain, growing in woods and thickets, is a half-shrubby plant with trailing stems, rooting at their extremities, ovato-lanceolate leaves, and pale-blue—sometimes white or reddish-purple—salver-shaped flowers. The GREATER PERIWINKLE (*V. major*), which has much larger flowers and ovato-cordate ciliated leaves, is a native of the south of Europe, and is found in a few places in the south of England. Both of these species are very commonly planted in shrubberies and gardens, rapidly cover unsightly objects with pleasing green foliage, and produce their beautiful flowers at almost all seasons of the year, even in winter when the weather is mild. The HERBACEOUS PERIWINKLE (*V herbacea*), a Hungarian species, is remarkable for the abundance of its flowers. The YELLOW PERIWINKLE (*V. lutea*) is a native of the southern parts of North America. The ROSE-COLORED PERI-

WINKLE (*V. rosea*), a native of Madagascar, is a favorite greenhouse plant.—The name periwinkle was formerly *perwinké*. Chaucer speaks of the "fresh perwinké rich of hue." It is probably from the French *pervenche*, and that from the Latin *vinca*.

PERJURY is the crime committed by one who, when giving evidence on oath as a witness in a court of justice, or before some constituted authority of the same kind, gives evidence which he knows to be false. But in order to make the giving of the false evidence liable to criminal punishment, it must have been not only false to the knowledge of the witness, but the matter must have been material to the issue raised. If the falsehood occurred as to some trifling or immaterial fact, no crime is committed. Moreover, it is necessary, in proving the crime, that at least two persons should be able to testify to the falsehood of the matter, so that there might be a majority of oaths on the matter—there being then two oaths to one. But this rule is satisfied though both witnesses do not testify to one point. The perjury must also have taken place before some court or tribunal which had power to administer the oath. See OATH. Though in some courts affirmations are allowed instead of oaths, yet the punishment for false affirmation is made precisely the same as for false swearing. The punishment in England was, before the Conquest, sometimes death or cutting out the tongue ; but latterly, it was confined to fine and imprisonment, and at present the latter is the only punishment, with the addition of hard labor. The crime of subornation of perjury—i.e., the persuading or procuring a person to give false evidence, is also punishable as a distinct offense.

PERKINS, ELISHA, 1741–99 ; born, Conn. He was the inventor of what were called Perkins's *tractors*, which at the commencement of this century were used by him, and by itinerant practitioners of medicine, as well as by some of the regular medical profession, for the treatment of rheumatism, neuralgia, and local inflammations. The instrument, or instruments—for they consisted of two bars of metal or pins, or whatever the apparatus may be called—was made of brass and iron, containing, as the inventor pretended, peculiar combinations of metals. Their use consisted in drawing them in a certain manner over the affected parts. The practice was called "Perkinsism," and obtained for a time a remarkable number of proselytes in this country, but especially in Europe. In London the practice was introduced by Perkins's son, and a Perkinsian institution, with lord Rivers as president, was established for the benefit of the poor. Five thousand cures were published, with the certificates of eight medical professors, forty physicians and surgeons, and thirty clergymen. In Copenhagen twelve physicians and surgeons, most of them instructors in the Royal Frederick's Hospital, made a "series" of experiments, which were published in an imposing octavo volume with a report in favor of the "system." In a few years, however, the tractors, as was inevitable, fell into disrepute, as their use did not justify their reputation. Perkins afterwards invented a fever medicine whose efficacy he undertook to demonstrate during the prevalence of yellow fever in New York in 1799, but after four weeks of toil he himself contracted the disease and died. It is not improbable that in some cases, where the tractors were used with some degree of pressure, they may have afforded some relief by the mechanical stimulus they supplied, similar to that afforded by manual rubbing and kneading, but, of course, in a much less degree. The benefits of exercise and motion in the treatment of diseases were not at that time appreciated as they are now; and as some improvement may have occasionally followed the use of the tractors, the therapeutics of which was not understood, it was concluded that they must possess certain inherent curative properties.

PERKINS, GEORGE ROBERTS, LL.D., 1812–76; b. N. Y.; taught mathematics at Clinton, 1831–38, when he became principal of the Utica academy. He was professor of mathematics at the state normal school, 1844–48 ; then was appointed its principal. In 1852 he took charge of the erection of the Dudley observatory, and in 1858 was made surveyor of the state. Among his publications are a series of arithmetics: *Treatise on Algebra*, 1841; *Elements of Geometry*, 1847; *Trigonometry and Surveying*, 1851; and *Plane and Solid Geometry*, 1857.

PERKINS, JACOB, 1766–1849 ; b. Mass.; during his apprenticeship with a goldsmith he invented a new method of plating shoe-buckles. In 1787 he made dies for the Massachusetts mint; also, he invented steel plates for bank-notes, and a machine for cutting and heading nails. In 1818 he went to England, and for a number of years afterwards was engaged in furnishing the bank of Ireland with plates. Among his inventions were the steam gun, and the bathometer, for measuring the depth of water. He was the first to prove the compressibility of water.

PERKINS, JUSTIN, D.D., 1805–69 ; b. Mass.; graduated at Amherst college in 1829; studied theology at Andover ; was tutor at Amherst, 1832–33; embarked at Boston, Sept. 21, 1833, as a missionary of the American board; reached Tabriz in 1834; and established the Nestorian mission at Oroomiah, Persia. He immediately engaged Mar Yohanna as his Syriac teacher. He was joined by Dr. Grant in 1835. Schools for boys and girls were established which have become flourishing seminaries. Besides these higher schools there are 70 primary schools, in which 3,000 Scripture readers have been educated, and many trained to preach the gospel. Dr. Perkins translated the Bible and several religious books into Syriac. In 1842 he returned to the United States, accompanied by Mar

Yohanna, the Nestorian bishop, whose presence and addresses awakened a deep interest in the mission. Dr. Perkins returned to Persia with Stoddard and other missionaries, laboring successfully until 1869, when with impaired health he returned to his native country, where he died. He published *Syriac Commentaries on Genesis and Daniel; Eight Years in Persia; Missionary Life in Persia.* He contributed also to the *Bibliotheca Sacra,* and to the *Journal of the American Oriental Society.*

PERKINS, Thomas Handasyd, 1764–1854; b. Boston; entered into partnership with his brother James in St. Domingo, but was compelled to leave by the insurrection of the blacks. In 1789 he went to Batavia and Canton, and familiarized himself with the Chinese and East Indian trade. He was in partnership with his brother James till 1822, and acquired a large fortune. He was for many years a member of the Massachusetts legislature, in either the senate or house. He was one of the originators of the Quincy railroad, one of the first in the United States; founded the Perkins asylum for the blind, contributed liberally to the Bunker Hill monument, and was one of the chief benefactors of the Boston athenæum and the Massachusetts hospital.

PERKIN WARBECK. See Henry VII.

PER'LEBERG, a t. of Prussia, province of Brandenburg, on the Stepenitz, with manufactures of wax, soap and mustard, etc. Pop. '95, with garrison, 8180.

PERM, the most eastern government of European Russia, is bounded on the e. by Siberia, and on the n., w. and s. by the governments of Vologda, Viatka, and Orenburg respectively. Area, 128,210 sq. m.—more than twice the area of England and Wales. Pop. '94, 2,941,337. It is divided by the Ural mountains into two unequal parts, of which the smaller portion is on the eastern or Siberian side of the mountains, although, for administrative purposes, it is reckoned as a part of European Russia. About three-fourths of the government are occupied by the Ural range, which reaches on a maximum 3600 ft.; but which slope so gradually toward the plain, that the traveler reaches their summit before he is aware that he has made any unusual ascent. About two-thirds of the entire surface, comprising all the northern districts, are covered with forests, one-tenth of the area is in meadows, and about the same extent is under cultivation. The more important rivers belong to the systems of the Volga and the Obi. The Kama, together with the Tshousovaia and other affluents from the Ural mountains, flow s.w., join the Volga, and thus form an important means of communication between the mining districts of Perm and Europe. The Tura, the Sosva, and the Losva communicate with the Obi; and access is opened up to the White sea and the Arctic ocean by the rivers Dwina and Petchora. The climate is healthy, though somewhat rigorous. At the end of July the nights are cold; in the middle of September falls the first snow. In November, when the whole face of nature is covered with snow, the transport of goods by sledges is busily carried on everywhere. In January the cold is so great that quicksilver sometimes freezes. At the end of March the snow begins to melt, and before the middle of May, although the cold is still great, the country is clothed in the green of early spring. The mines, the most important of Russia, are of gold, copper, magnetic iron ore, rock crystal, jasper, agate, topaz, porphyry, malachite, porcelain clay, salt (obtained from salt springs), coal, alabaster, marble, etc., and diamonds in small quantities. The inhabitants are chiefly Russians, but there are also numbers of Tartars, Bashkirs, and Finns. The agricultural produce of the government, consisting chiefly of corn, vegetables, flax, and hemp, is more than sufficient for local consumption, and is exported to some extent to the neighboring governments. The immense forests of the country yield wood for fuel, and timber for the construction of the barges which, during summer, are floated down the rivers, freighted with the products of the mines. 40,000,000 acres of the government are covered by forest; agriculture, especially in the south, is carried on extensively. The numerous mines employ over 100,000 hands, and recently their annual produce was estimated at 2,688,000 oz. of gold, 650 tons of copper, and 250,000 tons of pig iron. Here, also, are to be found rare metals, such as iridium, osmium, etc. The iron of Perm is famous all over Europe. The commerce of the government is very considerable. The fair of Irbit (q. v.) is, after that of Nijni-Novgorod, the most important in the Russian empire. The transit trade, however, is much more considerable than the local trade. The North Siberian railway from Perm and Berezniki passes to Chusovaya, and the government communicates by means of the Volga, Petchora, and the Obi with the Baltic, White, and Caspian seas. The central administration of mines has its seat in Ekaterinburg.

The government of Perm once formed a portion of the ancient Biarmia, inhabited in the earliest historical times by Finnish tribes, and even then famous for the commerce which it carried on, especially with Asia. In the 11th c., it became connected commercially with the principality of Novgorod, which, little by little, conquered and took possession of the country. At the close of the 15th c., both it and Novgorod were annexed to the territories of the prince of Moscow, but as early as the 12th c. the Christian religion had been introduced.

PERM, a t. of European Russia, capital of the government of the same name, on the Kama, and starting point of the North Siberian railway. It was founded in 1729, under the name of the Egotinsky copper-work, and was the first colony in the government from which it derives its name. It is the chief depot for the transport of convicts and

exiles to Siberia and is the seat of a most extensive transit trade. Here goods floated down the Tshousovaia from the Ural mountains, are transferred to larger vessels, and forwarded by the Kama and Volga past Nijni-Novgorod and Rybinsk, and thence to St. Petersburg. Goods from the sources of the Kama, metals, corn, tallow, and leathers, as well as Siberian and Chinese articles, are also sent from Perm to the Russian interior, and to Europe generally. It contains machine works and manufactories for rope, candles, soap and china. Pop. '91, 38,261.

PERMANGANATES, compounds of permanganic acid with bases. If to potassium manganate, free from excess of alkali, a large quantity of water is added, and the solution boiled, it is decomposed into manganese dioxide and potassium permanganate, which latter remains in solution while the dioxide is precipitated. The following equation represents the reaction:

$$3K_2MnO_4 + 2H_2O = MnO_2 + K_2Mn_2O_8 + 4KOH.$$

Remarkable changes of color accompany the decomposition, on which account this permanganate has been called *mineral chameleon*. Excess of alkali in the manganate confers more stability upon it, retarding the decomposition. On a large scale permanganate of potash is made by mixing equal parts of finely powdered manganese dioxide and potassium chlorate with rather more than one part of caustic potash dissolved in a little water, evaporating to dryness, and then heating to a point just below ignition. This mass is then treated with hot water, the insoluble oxide separated by decantation, and the purple liquid concentrated by evaporation until crystals form upon the surface. It is then left to cool and complete the process of crystallization. The crystals have a dark purple color and are not very soluble in water. The manganates and permanganates are decomposed when brought into contact with organic matter. The manganates are isomorphous with the sulphates, whilst the permanganates are isomorphous with the perchlorates. Condy's disinfecting fluids, sold in the drug shops, are alkaline manganates and permanganates. Hydrogen permanganate, or permanganic acid, $H_2Mn_2O_8$, is obtained by adding finely pulverized potassium permanganate to well-cooled, concentrated sulphuric acid, H_2SO_4. The acid is a reddish brown oily liquid, very unstable, giving off violet vapors, and decomposing with explosion on being heated. It has a strong attraction for moisture and for organic matter, setting fire to paper, etc., and to alcohol. Water is colored by a small amount of the permanganates, and such solutions are very delicate tests for deoxidizing matters, because these latter destroy the color by reducing the permanganate. A weak solution of a permanganate is used in the laboratory for determining the amount of oxidizable substances. The contaminations of drinking waters produced by septic fermentation are easily detected by using permanganates as reagents, and it is in consequence of their great oxidizing power that the permanganates are good disinfectants.

PERMIAN, MAGNESIAN LIMESTONE, or Dias group, is the lower division of the new red sandstone rocks, which were separated, chiefly on paleontological grounds, from the upper portion, and being, in 1841, without a collective name, were called Permian by Murchison, because he found them largely developed in that portion of Russia which composed the ancient kingdom of Permia, or Biarmia. The name magnesian limestone is given to them because of the predominant deposit; and dias has been proposed by some German geologists, to correspond with trias, the name universally accepted for the upper section of the new red sandstone series.

The Permian strata occupy in Russia an area twice the size of France, and contain an abundant and varied suite of fossils. They are also largely developed in Germany, and as they have been there carefully studied and described by numerous geologists, the rocks of that country may be considered as the types of the group. They have been thus grouped: 1. Bunterschiefer. 2. Zechstein. 3. Kupferschiefer or Mergel. 4. Rothe-todtliegende.

The bunterschiefer consists of red and mottled marl and sandstone, which have been separated from the triassic bunter sandstein, because of the occurrence in them of fossils which have a paleozoic facies. The zechstein is chiefly a compact limestone with beds of colored clays, and cellular magnesian limestone. The well-known stinkstein belongs to this series; it is a dark-colored and highly bituminous limestone, which gives out an offensive odor when struck or rubbed. The name zechstein (literally, minestone) was given to these beds, because they must be mined or cut through to reach the kupferschiefer below. This latter is a marl slate, richly impregnated with copper pyrites, for which it was extensively wrought. It contains numerous beautifully preserved fossil fish belonging to the genera palæniscus, cælacanthus, platysorus, etc. The strange name of rothe-todtliegende (red dead-layers) was given to a large deposit of red sandstone and conglomerate, by the miners, because the copper obtained from the beds above died out when they reached these red rocks.

The succession of rocks given by Murchison as occurring in Permia are easily co-related with those of Germany. They are (1), conglomerates and sandstones, containing the remains of plants; (2), red sandstones and shales, with copper ore and vegetable remains; and (3), sandstones, grits, and fossiliferous limestones, with interstratified beds

of marl and gypsum, the marls occasionally containing plants and also seams of impure coal.

In England the Permian rocks are somewhat extensively developed in Durham, where they have been described by Sedgwick and King. From this county they continue in a narrow strip bordering the carboniferous beds down the center of England until they are lost near Nottingham. In Cheshire, Shropshire, Stafford, and Warwick, they underlie the salt-bearing triassic rocks. The Durham strata are grouped as follows:

1. Concretionary and amorphous limestone.....
2. Brecciated and pseudo-brecciated limestone..... } =Bunterschiefer.
3. Fossiliferous limestone.....
4. Compact limestone..... } =Zechstein.
5. Marl slate..... =Kupferschiefer.
6. Inferior various-colored sandstone..... =Rothe-todtliegende.

The fractured bones and teeth of saurians found in the basement bed of the sixth group were considered the earliest evidence of the existence of reptiles until the discovery of the archegosaurus in the carboniferous rocks.

The known organic remains of this period are neither remarkable nor abundant. Many paleozoic forms became extinct within this period; among them are the remarkable sigillaria and the neuropteris of the coal-beds, the well-known brachiopod, producta, and several genera of heterocercal-tailed fish. Some new forms appear, the most important of which are the labyrinthodont reptiles, which, though beginning in the upper carboniferous beds, increase in number in the Permian, and reach their maximum development in the succeeding triassic group.

PERMUTA'TIONS AND COMBINA'TIONS. A combination, in mathematics, is a selection of a number of objects from a given set of objects, without any regard to the order in which they are placed. The objects are called elements, and the combinations are divided into classes, according to the number of elements in each. Let the given elements be the four letters *a, b, c, d;* the binary combinations or selections of two are *ab, ac, ad, bc, bd, cd*—six in all; the combinations of three are *abc, abd, acd, bcd*—four in all; while there is only one combination of four, namely, *abcd.*

Permutation, again, has reference to the order of arrangement; thus, the two elements *a* and *b* may stand *ab* or *ba,* so that every combination of two gives two permutations; the three elements *a, b,* and *c* may stand *abc, acb, bac, bca, cab, cba,* one combination of three thus affording six permutations. The combinations of any order with all their permutations are called the *variations.* Formulas are given in works of algebra for calculating the number of permutations or combinations in any given case. Suppose seven lottery-tickets marked 1, 2, 3, to 7, and that two are to be drawn; if it is asked how many possible pairs of numbers there are, this is a question of the number of combinations of seven elements, *two* together, which is found to be 21. If we want to know how many times the same seven persons could sit down to table together with a different arrangement each time, this is to ask how many permutations seven objects admit of, and the formula gives $7 \times 6 \times 5 \times 4 \times 3 \times 2 = 5{,}040$. The theory of probabilities is founded on the laws of combination. Thus, in the case of drawing two tickets out of seven, since there are 21 possible pairs, the chance or probability of drawing any particular pair is 1 in 21, or $\frac{1}{21}$. In working out questions in "combinations," advantage is often taken of the fact that whatever number of elements be *taken* from a group to form a combination, the number *left* gives the same number of combinations; thus the number of combinations of 10 elements *three* together, is the same as that of 10 elements *seven* together, etc.

PERN. See HONEY BUZZARD.

PERNAMBU'CO, a maritime province of Brazil, is bounded on the s.e. by Bahia and Alagoas, and on the n.w. by Piauhi, Ceara, and Parahiba. It contains 49,575 sq. m., and '90, a population of 1,101,539. The coast is flat, and fringed with coral reefs, which render navigation dangerous. The chief river is the San Francisco, which forms the southern boundary, and includes the greater portion of the area of the province in its basin. The banks of this river comprise many rich, expansive meadows, and here the cattle are reared which, in the form of beef and hides, form an important article of export at the seaport of Pernambuco. Much of the cotton and sugar brought to the market of the capital is harvested in regions fertilized by streams that rise at the base of the Santa Barbaretta hills, the first hill-range in this district that arrests the trade-wind from the Atlantic, laden with rain. Five railways connect the capital and the interior and have done much to encourage the cultivation of sugar and cotton. The coast region comprises immense tracts of rich and fertile soil, productive in sugar-cane, cotton, maize, fruits, vegetables, and medicinal herbs, but the western part is almost desert. From the forests, balsams, gums, and dye-woods are obtained.

PERNAMBU'CO, or RECIF'E, the most eastern seaport of Brazil, stands at the mouths of the Biberibe and Capeberibe, in lat. 8° 5′ s., long. 34° 52′ w., 80 m. s. of Parahiba. It is the greatest sugar-mart in Brazil, and is the third in commercial importance of the cities of the empire. It consists of 3 portions, connected by roads and bridges, — *Recife*

proper, the chief seat of commerce, on a peninsula; *S. Antonio*, the middle and principal district, on an island between the peninsula and the mainland; and *Bõa Vista*, on the mainland, which is the newer residential quarter. The inner harbor, which has a depth of from 24 to 33 ft., is formed by a reef which extends along the coast at a distance of from a quarter to half a mile from the coast. This reef serves the purposes of a breakwater. Opposite the northern extremity of the city there is an opening in the reef, resembling an artificial cut, and forming a passage of sufficient width to admit of the entrance of vessels drawing 16 ft. of water. No port is more easily accessible than the outer harbor of Pernambuco. There is a light-house in the harbor, and it is defended by several forts. Formerly the city was an English, and then a Dutch colony, but in 1654 fell into Portuguese hands after being greatly enlarged by Count Maurice of Holland. An observatory, arsenal, parliament house, etc., have been established, and the growing wealth and commercial prosperity of the city have been accompanied by an increasing degree of comfort and refinement. The principal exports are sugar, cotton, rum, hides, and dyewoods. The imports are woolen and cotton goods, provisions, and minerals, etc. The annual values of exports average 1 to 2 millions sterling. Pop. 1892, 190,000.

PERNAMBUCO WOOD. See BRAZIL WOOD.

PÉRNOW′ (Germ. *Pernau*), a seaport of the Baltic provinces, Russia, in the government of Livonia, stands on a sandy heath at the mouth of a river of the same name, on the gulf of Riga, 55 m. n. by e. of Riga, and 350 m. w.s.w. of St. Petersburg by sea. Pernow is a well built town founded in 1255 and annexed by Russia in 1710, and was fortified until the 16th century. There is an average depth of 12 ft. on the bar and good anchorage in the roads. The exports are chiefly flax, linseed; the principal imports are fish and coal. Pop. '91, 13,556.

PÉRONNE, a fortified t. in the dept. of the Somme, France, on the Somme river, abt. 94 m. n.e. of Paris. It has manufactories of sugar, oil, beer, etc. It was bombarded and forced to capitulate during the Franco-Prussian war, 1870–71, and was almost destroyed, but has since been rebuilt. It contains buildings which date back to the middle ages. Pop. comm. 4746.

PERONOSPHOR′EÆ, an order of fungi having ærial conidia. It includes only two genera, and the species are, with only one exception, parasites of living herbs. They have the appearance of white frost, and are usually found on the under side of the leaves. The order includes fungi which attack unsound potatoes, lettuce, cabbage, mustard, and the grape-vine. The mycelium penetrates all parts of the plant, even to the flowers, but spreads much more rapidly in damp than in dry weather.

PE′ROUSE, LA. See LA PE′ROUSE.

PERPENDICULAR. A straight line standing on another straight line is said to be perpendicular to that other when the angles it makes on both sides are equal (see ANGLE). A line is said to be perpendicular to a plane when it is at right angles to any line in that plane meeting it. Planes are said to be perpendicular to each other when any line in the one plane perpendicular to their common line of intersection is also perpendicular to all lines meeting it in the other plane.

The word "perpendicular," in common usage, refers to a direction at right angles to the surface of still water, and is synonymous with vertical.

PERPENDICULAR, the name given to the style of Gothic architecture in England which succeeded the decorated style. It prevailed from about the end of the 14th c. to the middle of the 16th c., and was thus contemporary with the flamboyant style in France. These styles have much in common, but they derive their names from the features peculiar to each. Thus the flamboyant (q.v.) is distinguished by the flowing lines of its tracery; whilst the perpendicular is remarkable for its stiff and rectilinear lines. The lines of the window-tracery are chiefly vertical, and the mullions are frequently crossed by horizontal bars. The moldings are usually thin and hard. The same feeling pervades the other features of the style; the buttresses, piers, towers, etc., are all drawn up and attenuated, and present in their shallow recesses and meager lines a great contrast to the deep shadows and bold moldings of the earlier styles. The art of masonry was well understood during the perpendicular period, and the vaulting was admirably built. Fan-tracery vaulting (q.v.) belongs to this style. The depressed or four-center arch is another of its peculiar features. This arch, over doorways, has the moldings generally arranged in a square form over th earch, with spandrels containing shields, quatrefoils, etc. Paneling was also much used, the walls being frequently almost entirely covered with it, as in Henry VII.'s chapel at Westminster. There are many well-known buildings of this style. Most of the colleges at Oxford and Cambridge belong to it, and in almost every cathedral and church of importance there are some specimens of it. Open timber roofs are very common in the perpendicular style, and are amongst the peculiar and beautiful features of the architecture of this country. The roof of Westminster hall, built by Richard II., is the largest example ever erected.

PERPENDICULAR FORTIFICATION owes its origin to the marquis de Montalembert, a distinguished French gen., who published his work upon the subject in 1776. Vauban had, it was admitted, rendered the art of attack superior to that of defense. Montalembert strove to reverse this relation, and, in his endeavors, rejected entirely the bastion system of the older engineers. Instead of the occasional bastions, with intervening curtains (see FORTIFICATION), with which they surrounded their *enceinte*, he broke the whole polygon into salient and re-entering angles, the latter being generally right angles. Before the connected redans thus formed were counter-guards of low elevation and ravelins, to which the approaches were through casemated *caponnières*. In the salient angle of each redan, he built a brick tower, 40 ft. in diameter, twelve-sided, and four stories high. The second and third tiers were built for heavy guns, and the upper loopholed for musketry. In the center of the tower was a circular *réduit*, intended as a last refuge for the garrison. Montalembert maintained that from these towers every possible approach could be commanded, which to a great extent is true; but it must be also remembered that the greater space a gun commands, by so much the more is it raised above the plain, and rendered visible. These towers would have little chance against the rifled ordnance of the present day. Montalembert's system was violently attacked by the French engineers, but Carnot subsequently adopted it, with some modifications, and it enters largely into the modern German defensive works. The system has never, however, found favor with other engineers.

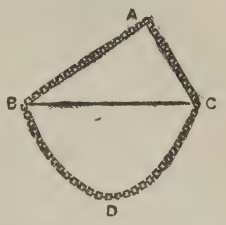
PERPETUAL CURE, a form of ecclesiastical benefice which grew out of the abuse of lay impropriation (q.v.), the impropriator appointing a clergyman to discharge the spiritual functions of which he himself was not capable. The substituted clergyman, in ordinary cases is appointed by the bishop, and called a vicar; but when no provision is made for a vicar the impropriator appoints the clergyman, who is called a perpetual curate. The perpetual curate enters on his office without induction or institution, and requires only the bishop's license. Perpetual cures are also created by the erection and endowment of a chapel subject to the principal church of a parish. Such cures, however, are not benefices unless endowed out of the fund called queen Anne's bounty. Churches so endowed are, by 2 and 3 Vict. c. 49, recognized as benefices. The district churches which have been erected under several recent acts are made perpetual cures, and their incumbents are corporations.

PERPETUAL MOTION, THE. According to Newton's first law (see MOTION, LAWS OF), all unresisted motion continues forever unchanged. Thus, *if friction could be avoided*, a top or a gyroscope spinning in vacuo is an instance of motion which would be unchanged forever, and which, therefore, might be called perpetual. The motion of the sun in space, the earth's rotation about its axis, and numerous other common motions, are in this popular sense perpetual. [It is necessary to remark here, that even these motions are subject to retardation; for instance, those of the bodies of the solar system, by the resistance of the luminiferous medium, which we know to be matter, and which fills all space. This was remarked by Newton himself, for he says, "The larger bodies, planets, and comets, preserve their motions longer (than terrestrial objects), because they move in less resisting media." The same cause influences the motion of the gyroscope, but in its case there is another retarding influence at work, due to the production of electric currents by the magnetism of the earth.] But this is not what is technically understood by the title *The Perpetual Motion*. It means an engine which, without any supply of power from without, can not only maintain its own motion forever, or as long as its materials last, but can also be applied to drive machinery, and therefore to do external work. In other words, it means a device for creating power energy without corresponding expenditure. This is now known to be absolutely impossible, no matter what physical forces be employed. In fact, the modern physical axiom, the conservation of energy (see FORCE), founded on experimental bases as certain as those which convince us of the truth of the laws of motion may be expressed, in the negative, thus: *The perpetual motion is impossible.* Helmholtz's beautiful investigations regarding conservation of energy (referred to in FORCE), are founded on this axiom. So is the recent application, by Clausius, of Carnot's remarkable investigation of the "motive-power of fire," to the true theory of heat. Other instances will be mentioned at the end of the article.

The complete statement of the impossibility of procuring perpetual motion with the ordinary mechanical arrangements, in which it was commonly sought, is found in the *Principia* (see NEWTON, SIR ISAAC), as a deduction from Newton's third law of motion. The equivalent principle of conservation of energy is there stated in a manner which leave nothing to be desired; although not given in anything like the modern phraseology. Yet it is usually said, in works on perpetual motion, that De La Hire (in 1678) gave the first proof of its impossibility in ordinary mechanics. This proof, published long after Newton's, is by no means so complete, as it exposes only some of the most patent absurdities which had been propounded for the solution of the problem. It is certain, and worthy of particular notice, that Newton was far in advance of the greatest of his contemporaries and their immediate successors, in even the fundamental notions of mechanics. Thus we find John Bernouilli seriously propounding a form of the perpetual motion, depending upon the alternate mixture, and separation by a filter, of two liquids of different densities; an arrangement which is as preposterous as the very common suggestion

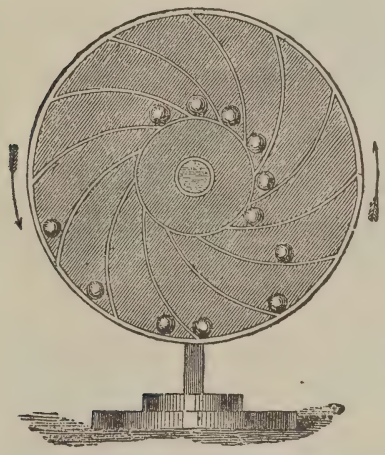
of a water-wheel which should pump up its own supply of water; and whose absurdity must be evident to any one acquainted with Newton's chapter on the laws of motion.

It is curious that, long before Newton's time, the physical axiom that the perpetual motion is impossible was assumed by Stevinus as a foundation for the science of statics. This is particularly interesting when we compare it with the magnificent discoveries which have been evolved in our own day from the same principle applied to the physical forces generally, and not to gravitation alone, as contemplated by Stevinus. His process is as follows: Let an endless chain of uniform weight be passsed round a smooth triangular prism ABC, of which the face BC is horizontal. The free portion of the chain BDC will hang in a symmetrical curve (CATENARY, q.v.), and its tension will therefore be the same at B and at C. Hence the other portion BAC of the chain will be free to move, unless the resolved part of the weight of AB, acting down the inclined plane AB, just balance that of the corresponding portion of the chain down AC. If these balance, the parallelogram of forces is proved; if not, one side will preponderate, and we shall evidently obtain the perpetual motion.

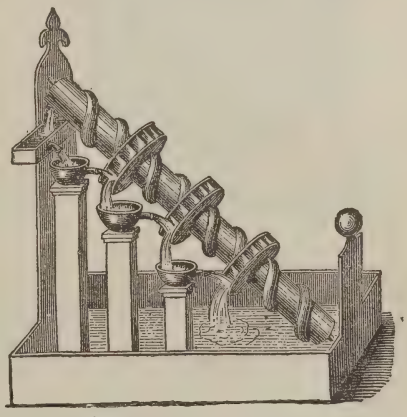


We will briefly sketch the history of the simpler part of the problem, where mechanical and hydrostatical arrangements alone are contemplated, and where the impossibility of procuring the perpetual motion had been completely shown by Newton.

The leading features of the various devices suggested as self-moving engines are three: 1. The machine being a combination of mechanical powers driven by weights, was to be constructed so as constantly to wind up those weights as they fell, and therefore to be constantly in the same circumstances as to power in each successive complete revolution. The ideal of this, in its simplest form, is that of a wheel moving about a horizontal axis, and so adjusting certain heavy sliding pieces on its surface as to have always a preponderance on one particular side. 2. The type of the second class differs



Merlin's Perpetual Motion.



Bishop Wilkins's Third Form

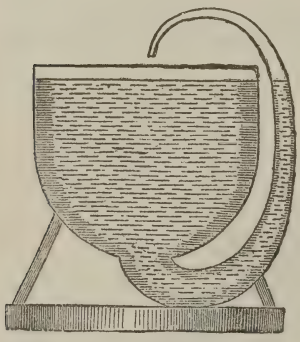
from that of the first only in the substitution of liquids for the weights in the first class, and the consequent introduction (often in most extravagant forms) of hydrostatical laws, which the inventors seem to have considered less certain and more pliable than the stern facts of common mechanics. 3. The machine depends on some natural power, such as rain, change of temperature, wind, fluctuations of the barometer, tides, etc. The consideration of this third class is very interesting, but we will defer it for a little.

Of the first class, the only machines that seem ever to have succeeded in permanently deceiving any but their inventors are those of the marquis of Worcester and of councilor Orffyreus. Contemporary with the former was bishop Wilkins, who candidly and ingeniously points out the fallacies of various devices of his own, depending severally on weights, on magnets, and on Archimedes's screw. His first attempt seems to have been closely allied to that of the marquis of Worcester, of whose engine we have no drawing, and only a very vague description. The following figure gives us, however, some notion of its probable nature. In Wilkins's and Jackson's perpetual motions, levers were used instead of balls.

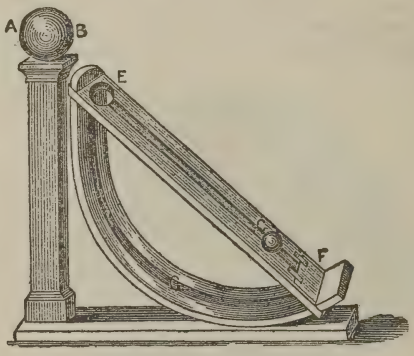
In all three, the attempt is by the sliding of the balls in their cells, or by the turning of the levers, to give the preponderance to the descending side of the wheel. But even

the cut shows that, though the weights on the descending side are on the whole further from the axis of the wheel than those on the ascending side, yet *there are more balls* on the latter than on the former side; and a careful examination, like that made by Wilkins, shows that their moments in opposite directions about the axis balance each other With reference to the invention of the marquis of Worcester—who is otherwise well known as one of the first to foresee, and even in part to realize experimentally, the advantage of steam as a motive-power—we find the following in his *Century of Inventions:* "*An Advantageous change of centers.*—To prouide and make that all y^e^ weights of y^e^ descending syde of a wheele shal be perpetually further from y^e^ center, then those of y^e^ mounting syde, and yett equall in number and heft of y^e^ one syde as y^e^ other. A most incredible thing if not seene, butt tryed before y^e^ late king of happy and glorious memorye in y^e^ Tower by my directions, two extraordnary embassadors accompanying his Ma^tie^ and y^e^ D. of Richmond, D. Hamilton, and most part of y^e^ court attending him. The wheele was 14 foote ouer, and 40 weights of 50 p^d^ apiece; S^r^ Wm. Belford, then Lieu^t^ of y^e^ Tower, and yet liuing can justify it with seuerall others; They all saw that noe sooner these great weights passed y^e^ Diameter Line of y^e^ vpper syde but they hung a foote further from y^e^ center, nor no sooner passed the Diameter Line of the lower syde, butt they hung a foote nearer; bee pleased to judge y^e^ consequence."*

The machine of Orffyreus, by which 'S Gravesande was completely deceived, so much so that he wrote to Newton expressing his belief that the perpetual motion was really found, consisted of a large wheel or drum covered with canvas, to prevent the interior from being seen, and rotating about a thick horizontal axle. This machine, when set agoing in either direction, moved with accelerated speed till it reached a rate of twenty-five turns in a minute; and on one occasion was sealed up by the elector of Cassel for two months, and at the expiration of that time found to be moving as rapidly as ever.



Norwood's Perpetual Motion.



Bishop Wilkins's Second Form.

This, like the celebrated automaton chess-player, was evidently a case of clever imposition; and but for its strange effect on 'S Gravesande, would probably have been forgotten long ago. Tricks of this kind, more or less ingenious, such as that of Spence of Linlithgow (1818), which many of our readers may recollect, are still common, especially in America.

Bishop Wilkins's third form is a good example of the second class of contrivances above mentioned. Three water-wheels, driven by the descending water, are intended to turn an Archimedean screw, so as constantly to replenish a tank above. Wilkins's calm investigation of the reasons why his device will not succeed is very interesting and creditable.

As a contrast, let us take a case of special absurdity, that of Norwood. In the figure, it is supposed that, as the weight of the water or mercury in the large vessel immensely exceeds that in the neck, it will preponderate, and drive the liquid through the spout into the vessel again; thereby furnishing, not only an admirable perpetual motion, but a conclusive disproof of one of the fundamental laws of hydrostatics.

The second of Wilkins's cases is an instructive one. It depends on magnetism, and will be readily understood from the cut. AB is a loadstone, which draws the iron ball, C, up the inclined plane to E, where there is a hole through which the ball falls down the curved incline, pushes open a trap at F, and is dragged again up the plane by the loadstone. The error of this is the neglect of the action of the loadstone on the falling ball. There would be an admirable case of the perpetual motion if we could remove or annihilate (without expenditure of work) the action of the loadstone during the descent. Unfortunately, the law of magnetic attraction is the same as that of gravitation, and what is impossible with the one must be equally so with the other. A good illustration

* See Harleian MS., No. 2,428, in the British Museum.

of this is Addeley's perpetual motion, represented in the annexed sketch. The spokes projecting from the wheel are magnets, whose south poles are all turned from the center. These are attracted by the north poles (N), and repelled by the south poles (S) of four fixed magnets; and blocks of *wood* (A) are interposed, to *prevent* magnetic action where it would tend to stop the machine! If it were possible to find a substance which would deal with gravitation or magnetism as an opaque body does with light (casting a shadow), the perpetual motion would be obtained with the greatest ease.

Addeley's Perpetual Motion.

It would be tedious and unprofitable to go through the various physical forces, showing how a misconception of their laws has led to hundreds of patented schemes for the production of perpetual motion. We may merely hint at magneto-electric machines turned by electro-magnetic engines, to which they supply the electric currents; electric machines, driven by a gas-engine, the fuel for which is supplied by the decomposition of water by the electricity produced, etc.; the absurdity of all of which may be imagined from the perfectly analogous case of a steam-engine to which heat might be supposed to be supplied by the friction of bodies driven by the engine itself. An excellent example of this absurdity is furnished by the writings of one of our ablest geologists. He considers that the internal heat of the earth may be due to chemical combination, that the heat so produced may develop thermo-electric currents, and that these in their turn may decompose the compounds formed, so that the process may go on indefinitely.

But the third class of attempts above described merits a few words. It certainly does *not* give the perpetual motion, but it is capable of furnishing prime-movers which will work uninterruptedly for perhaps hundreds of thousands of years. This is done, however, as we should expect, at the expense of other stores of energy in the universe. Thus, the tide-wheel, or tidal engine, a little-used but most effective source of power, derives its energy entirely from the earth's diurnal rotation. Engines driven by collected rain-water, such as mill-wheels, etc., and others driven by power stored up from winds, etc., depend upon energy radiated from the sun, mainly in the form of heat. None of these can, therefore, in strictness be called the perpetual motion, since the energy of the earth's rotation, or of the sun's heat, is drawn upon in their production.

But the complete proof of the impossibility of procuring the perpetual motion by any arrangement whatever, involving any known forces, was arrived at mainly by the experiments of Joule, who showed that the principle of the conservation of energy extends not alone to the forces for which it was enunciated by Newton, but to every known form of physical action. The date 1840–45 may thus be said to have finally settled this long-disputed question; at all events, until new forms of physical forces may happen to be discovered; and we are now in a position to do generally, what was wisely done by the French academy in 1775 for ordinary mechanical contrivances alone—viz., refuse to consider any scheme whatever which pretends to give work without corresponding and equivalent expenditure. The language in which this decision of the French academy is recorded (*Histoire de l'Académie*, 1775), is well worthy of being quoted, for its calm scientific clearness and brevity, and for its present applicability to physical science in general: "The construction of a perpetual motion is impossible. Even if the effect of the motive-power were not in the long run destroyed by friction and the resistance of the medium [in which the motion takes place], this power could produce merely an effect equivalent to itself. In order, therefore, to produce a perpetual effect from a finite cause that effect must be infinitely small in any finite time. Neglecting friction and resistance, a body to which motion has been given will retain it forever; but only on condition of its not acting on other bodies, and the only perpetual motion possible, on this hypothesis (which, besides, cannot occur in nature), would be useless for the object which the devisers of perpetual motion have in view. This species of research has the inconvenience of being costly; it has ruined many a family; and numerous mechanics, who might have done great service, have wasted on it their means, their time, and their talents.

"These are the principle motives which have led the academy to its decision. In resolving that it will no longer notice such speculations, it simply declares its opinion of the uselessness of the labors of those who are devoted to them."

It has been asserted that the infatuation of the perpetual motionists, who (as may be seen by a glance at the specifications of patents in Britain, France, Belgium, America, etc.), are perhaps more numerous now than ever, is due to two causes—one, the idea that the perpetual motion is a lost, but recoverable invention; the other, that some immense government reward has been for years laid aside for the successful discoverer. But, unhappily, these ideas are as fallacious as the grand delusion itself; and any one

who, in the present state of science, allows himself to be carried away by this fascinating inquiry, loses his time and wastes his talents, more hopelessly than even a "squarer of the circle."

In conclusion, we may mention a few of the cases already hinted at, in which the impossibility of the perpetual motion formed the basis of an investigation. These will show the great use which may be made of even a negative proposition. Helmholtz has shown from it that the ultimate particles of matter must exert upon each other forces, whose direction is that of the line joining each pair of particles, and whose magnitude depends solely on their distance. J. Thomson employed it to show that the freezing-point of water is lowered by pressure, as otherwise work might be created by the freezing of ice-cold water. W. Thomson has employed it to show that a diamagnetic (see DIAMAGNETISM) body does *not* take the opposite magnetism to iron, when in similar circumstances, for if it did, and if, like iron, it took time for the full development of the action, a perpetual motion might be produced.

The literature of this subject is very extensive, but scattered mainly through patent records and ephemeral pamphlets. The *Journal des Savants*, and Montucla's *Histoire des Mathematiques* may be consulted; but especially we would refer the curious to an interesting work by Mr. Dircks (of Patent-Ghost notoriety) entitled *Perpetuum Mobile* (Spon, London, 1861); to which we have been indebted for some of our historical notices. The tenor of the work is such that we cannot easily discover whether the author is a perpetual-motionist or not; but, however this may be, it is extremely complete and interesting as a history.

PERPETUITIES, LAW AGAINST, consists in a rule adopted in England to the effect that property cannot be tied up for a period longer than the lives of some parties already in existence, and 21 years more. Those who have the power of disposing of their property have often attempted to regulate the succession of their estate at distant periods. Such was the object of the original practice of entailing property, and so enforcing the devolution of property on a certain series of heirs to the remotest generations. This power of testators was always looked upon with jealousy, as tending to embarrass future dealings with the property, and frustrate the purposes for which property is established. So early as the reign of Edward IV. a decision was come to by the courts in Taltarum's case, which had the effect of allowing the first tenant in tail in remainder, on arriving at majority, to disentail the estate at discretion. Hence, in England, there has been ever since no mode of settling property in any way so as to tie it up beyond the life of the first who takes an estate of freehold, and the nonage of the tenant in tail next in remainder—i.e., the lives of persons in existence, and 21 years more. This principle applies not only to land, but to personal property. As to the accumulation of the income of property, an attempt was made by the late Mr. Thellusson to create an immense fortune by directing the income of his property to be accumulated during the lives of all his children, grandchildren, and great-grandchildren, who were living at the time of his death, for the benfit of some future descendants, to be living at the death of the survivor. The probable amount of the accumulated fund was expected to be 19 millions. The will was in great measure defeated by the existing law, but in consequence of so conspicuous an attempt, an act of parliament was passed, called the Thellusson act (39 and 40 Geo. III. c. 98), which in future forbids the accumulation of income for any longer time than the life of the grantor or settler, or 21 years from his death. The law in relation to perpetuities in the U. S. is generally the same as in England. It is recognized to be against the policy of the law to allow a person to tie up property for an unreasonably long time. The limitation is fixed by statute in each state, and is ordinarily expressed as being for two lives in being and 21 years afterward. In some instances the period of gestation is added.

PERPIGNAN, a t. of France, and a fortress of the first rank, capital of the department of Pyrénées-Orientales, on the right bank of the river Tet, 5 m. from the Mediterranean, and 35 m. s. by w. of Narbonne. It commands the passage by the eastern Pyrenees from Spain into France, and is defended on the s. by a citadel and by ramparts flanked with bastions, and protected by raised works. Its appearance is exceedingly picturesque. From a distance, its houses are seen in the midst of a forest of orchards; and a closer examination shows a collection of narrow streets, covered with awnings, houses of semi-Moresque construction, with wooden balconies, and courts, and other evidences of Spanish influence. The cathedral, a massive building, begun in the 13th c., the belfry of St. Jacques and the Castiller (now used as a military prison), with its battlement and machicolations, give character to the town. Perpignan is an important scholastic center, and contains a library with 20,000 volumes, a college, numerous schools, museums, and scientific societies. Good *vin ordinaire* (red) is grown in the vicinity; woolen clothes, paper, chocolate, etc., are manufactured, and there is a good trade in wine, wool, cork-bark, and iron ware. Pop. '96, com., 35,088.

Perpignan, as capital of the former county of Roussillon, remained long in the hands of the kings of Aragon, and in 1349 King Pedro founded a university here.

PERQUIM'ANS, a co. in n.e. North Carolina, having Little river on the n. and n.e., Albemarle sound on the s., and Perquimans river dividing it centrally and emptying into the sound; 240 sq. m.; pop. '90, 9293, chiefly of American birth, includ. colored. Its surface is level and swampy, largely covered with a thick growth of pine. The soil is

fertile in the central portion, where it produces corn, cotton, and wheat. Cattle, sheep, and swine are raised. Co. seat, Hertford.

PERRAUD, JEAN JOSEPH, 1821–76; born in a village of the Jura; apprenticed to a wood-carver, afterwards pupil of a school of sculpture in Lyons where he won its highest prize, and in 1842 entered the school *des beaux arts* at Paris. He was then so poor that the government allowed him a gratuity to enable him to go through his studies. In 1847 he produced "Télémacque rapportant à Phalante les ceudres d'Hippias," a low-relief which won the grand prize and enabled him to go to Rome where a life size low-relief group of three figures, entitled "Adieux," attracted great attention, though not cut in marble till 27 years later. He has since achieved the highest rank among French sculptors. "Adam," finished in 1852; "L'Enfance de Bacchus" and "La Faune," in 1857; "St. Geneviéve," 1868; "Désespoir," 1869; "Galatée," 1873; and "Où l'amour va-t-il se nicher?" are a few among a great number, some colossal and others small, of his works.

PERRAULT, CHARLES, a French writer, b. at Paris, Jan. 12, 1628, was the son of an advocate, and received a good education. In 1651 he became a member of the Paris bar, and obtained a considerable measure of success as a pleader; but having made the acquaintance of the minister Colbert, he was ere long diverted from the practice of his profession by receiving the appointment of controller-general of the royal buildings. In 1671 the influence of Colbert procured for him an entrance into the French academy, into which learned body he introduced several important reforms. What first made his name well known was his famous controversy with Boileau regarding the comparative merits of the ancients and moderns, which originated in a poem of Perrault's, entitled *Le Siècle de Louis le Grand,* read before his confrères of the academy, and intended to prove that modern authors were superior to Homer, Herodotus, Plato, Aristotle, Virgil, etc. It was followed up by an elaborate and methodically written *Parallèle des Anciens et des Modernes* (4 vols. 1688–98), which, though an able and learned performance, is a complete failure in its logic. Boileau was his keenest opponent, and fiercely, not to say rudely assailed him in his *Réflexions sur Longin,* to which Perrault replied with equal acrimony, but not with equal wit, in his *Apologie des Femmes* (1694). One good effect of this quarrel was to turn Perrault's attention still more closely and critically to his contemporaries, the result of which was an admirable work, *Hommes Illustres du Siècle de Louis XIV.,* containing 200 critical biographies. But the work that has far more than any other preserved his name is his *Contes des Fées,* or Fairy Tales. See NOVELS. The grace, liveliness, and ingenious child-like fancy displayed in these charming compositions, are beyond all praise, and when we remember that their author was far advanced in years when he wrote them, the feat seems miraculous. "Second childhood" is not always so like the "first," as that of Perrault seems to have been. Perrault died May 16, 1703.

PERRENOT, ANTOINE DE. See GRANVELLE.

PERRON, ANQUETIL DU. See ANQUETIL DUPERRON.

PERRONE, GIOVANNI, 1794–1876; b. Italy; was educated in the university of Turin; went to Rome at the age of 21, and joined the society of the Jesuits. After a year of novitiate he went to Orvieto to teach theology to the Jesuit students. Being ordained priest he was appointed in 1830 rector of the college of Ferrara, and in 1838 taught theology in the Roman college. At the revolution of 1848 he went to England, and returned in 1850. Three years later he was made rector of all the Roman colleges. Regarded as one of the greatest theologians of Italy, he from this time took his seat in the congregation of bishops and regulars, and in the provincial councils, and had the charge of the revision of the books of the eastern church. He was also counselor to the propaganda and the ritual committee. He published more than 60 works, which have been translated into Latin, French, German, English, and Armenian, of which the principal are, *Prælectiones Theologicæ,* 9 vols. (of this there have been 25 editions); *Synopsis Historiæ Theologiæcum Philosophia Comparatæ; De Immaculato B. V. Mariæ Conceptu, au Dogmatico Decreto definiri possit; Analyse et Considerations sur la Symbolique de Moehler; Analyse et Réflexions sur l'Histoire d'Innocent III; Il Protestantismo.*

PERROT, GEORGES, b. France, 1832; educated at the Collège Charlemagne, the normal school, and the French school at Athens. In 1861 he went on an archæological expedition to Asia Minor; in 1863 became a professor in the lyceum Louis-le-Grand, in Paris; in 1877, professor of archæology in the university, and in 1883, director of the higher normal school. Among his publications are *Recollections of a Journey in Asia Minor,* 1864; *The Island of Crete,* 1866; and *Essay on the public and private Law of the Athenians,* 1867.

PERROT D'ABLANCOURT, NICOLAS, 1606–64; b. Chalons-sur-Marne, France; began his career as a lawyer, was entered at the bar, 1624, abandoned law for literature, deserted the Protestant for the Roman Catholic church, and, still unsatisfied, returned after a time to his original faith. He removed from Paris to Holland to read with Saumaise; then he went to England; again to Paris, and in 1637 he became a member of the French academy, and translated the works of Tacitus, which have passed through ten editions. He left Paris and settled on his family estate of Ablancourt. In 1662, at the suggestion of Colbert, he was proposed to Louis XIV. as the historian of his reign, but

his Protestantism stood in the way; he was, however, granted a pension of £120 as his toriographer. Patru wrote his life. His works are distinguished chiefly for elegance of style; the most highly esteemed for this quality is his *Arrian's Wars of Alexander;* other works are translations of *Thucydides, Cæsar, Minutius Felix,* Xenophon's *Anabasis,* four *Orations* of Cicero, the *Strategematica* of Frontinus, the *Apothegms* of the ancients, and an imitation of Lucian.

PERRY, an agreeable beverage made by fermenting the juice of pears. It is extensively made in Worcestershire, Gloucestershire, Herefordshire, and Devonshire, and forms, with cider, the chief diet-drink of those districts. It contains from five to nine per cent of alcohol. The best pears for making perry are those which from their rough taste are least agreeable for eating.

PERRY, a co. in central Alabama, drained by the Cahawba river flowing through it centrally; 774 sq.m.; pop. '90, 29,332, chiefly of American birth, inclu. colored. It is intersected by the Kansas City, Memphis, and Birmingham railroad; and in the s.w. by Washington creek. Its surface is hilly and well timbered. The soil is fertile. Stock-raising is carried on to some extent, and corn, cotton, and tobacco are raised. It contains mineral springs in the northern portion. Co. seat, Marion.

PERRY, a co. in w. central Arkansas, drained by Fourche La Fave and the Arkansas river, which bounds it on the n. and e.; 560 sq. m.; pop. '90, 5538, chiefly of American birth, with colored. The surface is hilly and broken; corn, cotton, and pork are the staples. Coal and marble are found. Co. seat, Perryville.

PERRY, a co. in s. Illinois, intersected by branches of the Illinois Central railroad and by the Wabash, Chester, and Western railroad; 440 sq. m.; pop. '90, 17,529, chiefly of American birth, with colored. It is drained by Beaucoup and Colombo creeks, rising within its limits and emptying into the Mississippi river. The surface is generally level, and a large proportion covered with oak, hickory, and walnut trees. It has an underlying stratum of bituminous coal easily mined. Its soil is moderately fertile. Stock is raised, and the usual products of the western states. Coal mining is the principal industry, and the manufactures include carriages, plows, lumber, flour, saddlery, and harness, agricultural implements, etc. Co. seat, Pinckneyville.

PERRY, a co. in s. Indiana, having the Ohio river for its s. and s.e. boundary, separating it from Kentucky; bounded on the w. by Anderson's creek; 380 sq.m.; pop.' 90, 18,240, chiefly of American birth, with colored. Its surface is hilly, and contains coal mines which appear to be inexhaustible, producing coals, notably those of Cannelton, extensively used in steamboats. Sandstone abounds, and iron. The soil is fertile along the water courses, producing grain and tobacco, and is adapted to stock-raising. Its manufactures are important and constantly increasing, the product of potteries, paper-mills, chair factories, breweries, flour and lumber mills. Co. seat, Cannelton.

PERRY, a co. in s.e. Kentucky, drained by the n. and middle forks of the Kentucky river; about 448 sq.m.; pop. '90, 6331, chiefly of American birth, with colored. The surface is rugged and broken, mostly covered by forests. Corn and grass are the main products. Coal is found. Co. seat, Hazard.

PERRY, a co. in s.e. Mississippi; drained by Leaf river and Black, Bogue Homo, and Tallahala creeks; 1116 sq.m.; pop. '90, 6494, chiefly of American birth, with colored. The surface is almost entirely covered with pine forests. Cotton, corn, cattle and pork, are staples. Co. seat, Augusta.

PERRY, a co. in s.e. Missouri, having the Mississippi river for its e. and n.e. boundary, separating it from Illinois; drained by small creeks; 436 sq.m.; pop. '90, 13,237, chiefly of American birth, with colored. Its surface is rough, large tracts being covered with heavy timber and groves of ash, elm, tulip-tree, etc. The hills contain carboniferous limestone, lead and iron ore, and marble. Its soil is fertile. Co. seat, Perryville.

PERRY, a co. in s.e. Ohio, intersected by the Cincinnati and Muskingum Valley railroad, and by the Ohio Central lines of railroad; 402 sq. m.; pop. '90, 31,151, chiefly of American birth, with colored. It is drained by the head waters of the Hocking river, and a few small creeks. Co. seat, New Lexington.

PERRY, a co. in central Pennsylvania, having the Susquehanna river for its e. and n.e. boundary, a range of the Blue mountains on the s., and the Tuscarora mountains on the w. and n.w.; drained by the Juniata river and Sherman's creek; 550 sq.m.; pop. '90, 26,276, chiefly of American birth, with colored. Its surface is crossed by several mountain ridges well covered with forests of hard wood, and containing limestone and iron ore—the latter extensively mined. It is intersected by the Pennsylvania railroad. The soil of its beautiful valleys is adapted to stock-raising, and produces grain, dairy products, and sweet-potatoes. Its leading industries are the manufacture of leather, flour, metallic wares, boots, woolen goods, etc., and it has wool-carding and cloth-dressing mills. Co. seat, New Bloomfield.

PERRY, a co. in w. central Tennessee; drained by the Buffalo and Tennessee rivers, the latter being the w. boundary; about 420 sq.m.; pop. '90, 7785, chiefly of American birth, with colored. The surface is uneven but fertile; corn, wheat, buckwheat, and peanuts, are the chief products. Limestone is found. Co. seat, Linden.

PERRY, Arthur Latham, b. Lyme, N. H., 1830 ; graduate of Williams College, 1852 professor of history and political economy at the same institution, 1854. He was at one time a correspondent of the *Springfield Republican*, and was minister of a church in Williamstown. In 1865 he published *Elements of Political Economy* in advocacy of free-trade. By the adherents of that system, his writings are regarded as of high authority.

PERRY, Christopher Raymond, 1761–1818; b. R. I.; at the beginning of the revolution he joined the navy, rose to the rank of captain, and served with distinction in several naval engagements. He was captured and for some time confined in the notorious *Jersey* prison-ship. In 1798 he was made a post-captain, and in 1801 was appointed collector of the port of Newport. His five sons, of whom Oliver Hazard and Matthew Calbraith were the most famous, all served with credit as naval officers in the war of 1812.

PERRY, Matthew Calbraith, 1794–1858; b. South Kingston, R. I.; son of Christopher R., and brother of Oliver Hazard; entered the navy 1809; lieut. 1813. In 1819, while cruising in the *Cyane*, he settled the question of the location of the first occupation of Liberia. In 1821–24, in command of the schooner *Shark*, he captured several pirates near the West India islands. In 1833 after a 3-years' cruise in the Mediterranean he became the superintendent of a school for gun practice in the Brooklyn navy-yard and superintended the application of steam to war vessels. In 1837 he was made capt., and in 1838 went abroad to visit the dock-yards, and inspect the danger signals on the coasts. In 1839–41 he was commandant at the Brooklyn navy-yard, afterward of the African squadron and the gulf squadron, and gallantly co-operated with the land forces at the battle of Vera Cruz. In 1852–54 he went on an expedition to Japan. He was one of the first public men in this country who looked for the peaceful opening of Japan, and long before he was appointed to command the fleet, March, 1852, he had carefully studied the land, the people, and the problem from every side. He arrived off Uraga in the bay of Yedo July 7, 1853, and after leaving letters for the Tycoon sailed away July 17, and returned in Feb., 1854. On March 8 the formal articles of convention between the United States and Japan were exchanged, at Yokohama, on the spot now occupied by the Union Christian church. Perry's one mistake was in not treating with the true sovereign, the Mikado, from Ozaka, instead of with his lieutenant, the Tycoon. Commodore Perry was a cultivated scholar, and the *Narrative of the Expedition of an American Squadron to the China Seas and Japan*, though nominally edited by Dr. Francis L. Hawks, is in the main an exact reprint of Perry's diary and autograph narrative. He died in New York. A superb bronze statue of Commodore M. C. Perry, with four bas-reliefs in bronze illustrating scenes in his public life, by J. Q. A. Ward, stands in Truro Park, Newport, R. I., erected by his son-in-law, August Belmont, of New York.

PERRY, Oliver Hazard, 1785–1819 ; b. South Kingston, R. I.; son of Christopher R.; grandson of Judge Freeman Perry ; entered the navy April, 1799, serving soon after in the Tripolitan war, was made master-commander 1812; was in command of a small fleet of gunboats in New York harbor in 1812. In 1813 he served under Chauncey on lake Ontario co-operating in the attack on Fort George ; subsequently was placed in command of a squadron on lake Erie, and with 9 small vessels gained a victory over the British fleet Sept. 10, 1813. These services were publicly acknowledged by congress and the Pennsylvania senate, and he was promoted to capt., his commission dating from the day of the victory. He was present at the re-taking of Detroit, co-operating with Gen Harrison, and at the battle of the Thames, Oct. 5, 1813. In 1815 he was on the Mediterranean in Decatur's squadron in command of the *Java*. In 1819 he went to the West Indies in the *John Adams*, and died of the yellow fever. In 1860 a marble statue was erected to his memory at Cleveland, Ohio.

PERRY, William Stevens, d.d., ll.d., b. Providence, R. I., 1832, graduated at Harvard Coll., 1854 ; ordained priest in the Prot. Epis. church, 1858 ; held several rectorships in New England, and was pres. of Hobart coll., 1876. He was consecrated bp. of Iowa, 1876. Bp. Perry is the author of many works ; among these are : *The Connection of the Church of England with Early American Colonization*, *Questions on the Life and Labors of the Great Apostle*, and many historical collections of the American colonial church. In 1885 he published his great work on the history of the Epis. church.

PERSEA. See Avocado Pear.

PERSECUTIONS, THE TEN, of the Christian church, is the name by which are known in ecclesiastical history certain periods of special severity exercised towards the rising community of Christians, for the purpose of compelling them to renounce their new creed, and to conform to the established religion of the empire. The Christian community were at all times regarded with suspicion and dislike in the Roman empire—the constitution of Rome not only being essentially intolerant of those new religions which, like the Christian, were directly aggressive against the established religion of the state, but being particularly hostile to private associations and private assemblages for worship, such as those which every Christian congregation by its very nature presented; and thus there are very few periods, during the first three centuries, in which it can be said that the church enjoyed everywhere a complete immunity from persecution. But the name

is given particularly to certain periods when either new enactments were passed against Christianity, or the existing ones were enforced with unusual rigor. The notion of *ten* such periods is commonly accepted almost as an historical axiom; and it is not generally known that this precise determination of the number is comparatively recent. In the 4th c., no settled theory of the number of persecutions seems to have been adopted. Lactantius reckons up but six; Eusebius does not state what the number was, but his narrative supplies data for nine. Sulpicius Severus, in the 5th c., is the first who expressly states the number at *ten;* but he only enumerates nine in detail, and in completing the number to ten, he adds the general persecutiou which, at the coming of Antichrist, is to precede the end of the world. The fixing of ten as the number seems to have orignated in a mystic allusion to the ten horns of the beast in the apocalypse (xvii. 12).

It need hardly be said, however, that this is only a question of words, the diversity of enumeration arising from the different notions attached by the several historians to the designation *general.* If taken quite strictly to comprise the entire Roman empire, the number must fall below ten; if used more loosely of local persecutions, the number might be very largely increased. The ten persecutions commonly regarded as general are the following: the persecution under Nero, 64 A.D.; under Domitian, 95 A.D.; under Trajan, 107 A.D.; under Hadrian, 125 A.D.; under Marcus Aurelius, 165, A.D.; under Septimius Severus, 202 A.D.; under Maximinus, 235, A,D.; under Decius, 249 A.D.; under Valerianus, 257 A.D.; under Diocletian, 303 A.D. The extent and the duration of some of these have been the subject of considerable controversy, and indeed an animated discussion was maintained for a long period as to the probable total number of victims in the pagan persecutions of the church. Such controversies are beyond the scope of this publication. It is quite certain that there have been exaggerations on the Christian as well as on the adverse side; but it has been shown beyond the possibility of doubt, and the most recent explorations have confirmed the arguments, that the data on which the estimates of Dodwell and Gibbon, the most prominent advocates of the theory of the small number, were founded, were uncertain, and even fallacious; and that, not to speak of the many victims of the constantly recurring local violences, the number who fell in each of the above-named persecutions was both large in itself, and spread, in most cases, over a considerable extent of the Roman empire. The most violent, as well as the most widely-spread of these persecutions, were those under Nero, Trajan, Maximinius, Decius, and Diocletian. The last-named, though called by Diocletian's name, was in reality far less the work of that emperor than of his colleague Galerius; but it was extremely cruel, and, with occasional interruptions, continued from the year 303 down to the victory of Constantine over Maxentius—a period of nearly ten years.

PERSEPH'ONE. See PROSERPINA.

PERSEP'OLIS (Persian City), the Greek translation of the lost name of the capital of ancient Persia (*Parsa-Karta?*), was situated on the river Araxes (Bendemir), to the e. of the river Medus (Polwat, or river of Murghab), in the plain of Merdusht, about 35 m. to the n.e. of Shiraz, on the road to Ispahan. A certain number of most remarkable ruins is all that now remains of that city, with which, according to ancient writers, "no other city could be compared either in beauty or in wealth," and which was generally designated "the glory of the east." Darius Hystaspes, Xerxes, Artaxerxes, and other Achæmenides, each in his turn contributed towards its aggrandizement. Alexander the great, in his march of conquest, is said to have destroyed Persepolis completely; but this must probably only be understood to apply to some of the chief palaces. It may also be presumed that after the fall of the Achæmenides, that extension of the original town (afterwards known, and important in history up to within a recent period, as Istakhar), on which were situated the royal edifices and temples used as the royal treasuries up to the time of Epiphanes, gradually fell into decay. The situation of these structures, overlooking the vast luxuriant plain of Merdusht, is described in terms of rapturous enthusiasm by every traveler from Chardin to our own day. Three groups are chiefly distinguishable in the vast ruins existing on the spot. First, the Chehel Minâr (Forty Pillars), with the Mountain of the Tombs (Rachmed), also called Takht-i-Jamshîd or the structure of Jamshîd, after some fabulous ancient king, popularly supposed to be the founder of Persepolis. The next in order is Naksh-i-Rustam, to the n.w., with its tombs; and the last, the building called the Haram of Jamshîd. The most important is the first group, situated on a vast terrace of cyclopean masonry at the foot of a lofty mountain-range. The extent of this terrace is about 1500 ft. n. by s., and about 800 e. by w., and it was, according to Diodorus Siculus, once surrounded by a triple wall of 16, 32, and 60 cubits respectively in height, for the triple purpose of giving strength, inspiring awe, and defense. The whole internal area is further divided into three terraces—the lowest towards the s.; the central being 800 ft. square, and rising 45 ft. above the plain, and the third, the northern, about 550 ft. long, and 35 ft. high. No traces of structures are to be found on the lowest platform; on the northern, only the so-called "Propylæa" of Xerxes; but the central platform seems to have been occupied by the foremost structures, which again, however, do not all appear to have stood on the same level. There are distinguished here the so-called "great hall of Xerxes," called Chehel Minâr, by way of eminence), the palace of Xerxes, and the palace of Darius,

towering one above the other in successive elevation from the ground. The stone used for the buildings is dark-gray marble, cut into gigantic square blocks, and in many cases exquisitely polished. The ascent from the plain to the great northern platform is formed by two double flights, the steps of which are nearly 22 ft. wide, 3½ in. high, and 15 in. in the tread, so that several travelers have been able to ascend them on horseback. What are called the propylæa of Xerxes on this platform are two masses of stone-work, which probably formed an entrance-gateway for foot-passengers, paved with gigantic slabs of polished marble. Portals, still standing, bear figures of animals 15 ft. high, closely resembling the Assyrian bulls of Nineveh. The building itself, conjectured to have been a hall 82 ft. square, is, according to the cuneiform inscription, as interpreted by Rawlinson, the work of Xerxes; the inscription reads as follows:

"The great god Auramajda, he it is who has given this world, and who has given life to mankind, who has made Xerxes king, both king and law-giver of the people. I am Xerxes the king, the great king, the king of kings, the king of the many-peopled countries, the supporter also of the great world, the son of king Darius, the Achæmenian.

"Says Xerxes the king, by the grace of Auramajda, I have made this gate of entrance; there is many another nobler work besides this Persepolis which I have executed, and which my father has executed;" etc.

An expanse of 162 ft. divides this platform from the central one, which still bears many of those columns of the hall of Xerxes from which the ruins have taken their name. The staircase leading up to the Chehel Minâr, or Forty Pillars, is, if possible, still more magnificent than the first; and the walls are more superbly decorated with sculptures, representing colossal warriors with spears, gigantic bulls, combats with wild beasts, processions, and the like; while broken capitals, shafts, pillars, and countless fragments of buildings, with cuneiform inscriptions, cover the whole vast space of this platform, 350 ft. from n. to s., and 380 from e. to west. The great hall of Xerxes is computed to have been a rectangle of about 300 to 350 ft., and to have consequently covered 105,000 sq. ft., or 2½ acres. The pillars were arranged in four divisions, consisting of a center group six deep every way, and an advanced body of twelve in two ranks, the same number flanking the center. Fifteen columns are all that now remain of the number. Their form is very beautiful. Their height is 60 ft., the circumference of the shaft, 16, the length from the capital to the torus, 44 feet. The shaft is finely fluted in 52 divisions; at its lower extremity begin a cincture and a torus, the first, 2 in. in depth, and the latter, 1 ft., from whence devolves the pedestal, shaped like the cup and leaves of the pendent lotus, the capitals having been surmounted by the double semi-bull. Behind the hall of Xerxes was the so-called hall of hundred columns, to the s. of which are indications of another structure, which Fergusson terms the central edifice. Next along the w. front stood the palace of Darius, and to the s. the palace of Xerxes, measuring about 86 ft. square, similarly decorated. The chief ruin exists at Haji Abad on the river Polvar, a few miles above P. See travels of Niebuhr, Ker Porter, Rich, etc.; Fergusson's *Palaces of Nineveh and Persepolis Restored;* Vaux's *Nineveh and Persepolis*, and Rawlinson's *Five Great Monarchies*. See also CYRUS, DARIUS, XERXES, CUNEIFORM, and PERSIAN ARCHITECTURE. See illus., PERSIA, p. 536; ARCHITECTURE, Vol. I.

PERSON, a co. in n. North Carolina, having the state line of Virginia for its n. boundary; drained by head waters of Dan river, and the Hycootee and Flat rivers; 420 sq.m.; pop. '90, 15,151, chiefly of American birth, inclu. colored. Its surface is diversified by hill, valley, and plain, well covered with forests of pine, oak, and hickory, and containing copper ores, graphite, and slate. Its soil produces grain, sweet-potatoes, tobacco, and dairy products. Live stock is raised. Co. seat, Roxboro.

PERSEUS, also PERSES, the last king of Macedonia, was the eldest son of Philip V., and was b. in the latter part of the 3d c. B.C. He was trained to a military life from his earliest years, and after bringing about the death of his younger brother Demetrius, who was a favorite both with the Macedonians and the Romans, he succeeded his father on the throne 179 B.C. Philip had long foreseen that a contest between Rome and Macedon was inevitable, and he had carefully prepared for it, so that Perseus, on his accession, found himself forearmed. Meanwhile he governed Macedon with great prudence and moderation, and became decidedly popular with his subjects and neighbors. Seleucus IV. (Philopator) gave him his daughter Laodice in marriage; Prusias, the Bithynian king, married his sister; the Greek states looked favorably on his projects, and his envoys were well received even at Carthage. The Romans took the alarm, and—after some delusive negotiations—sent an army into Thessaly (171 B.C.). The war lasted four years; in the first three the advantages were so little on the side of the Romans that there was a wide-spread feeling in Perseus's favor in the countries bordering on the Levant and the Archipelago. In the beginning of the fourth campaign (168 B.C.), L. Æmilius Paulus arrived, and took command of the Roman forces. A great battle was fought at Pydna (June 22), in which the army of Perseus was utterly routed. The king himself was soon afterwards forced to surrender, and conveyed to Rome, where he adorned the triumph of the conqueror. He died in captivity at Alba, a few years later.

PERSEUS, in Grecian mythology, the son of Zeus and Danaë (q.v.), and grandson of Acrisius. He was brought up at Seriphos, one of the Cyclades, where Polydectes

reigned, who, wishing to get rid of him for private reasons, sent him when yet a youth to bring the head of the Gorgon Medusa, on the pretense that he wanted to present it as a bridal gift to Hippodamia. Perseus set forth under the protection of Athene and Hermes, the former of whom gave him a mirror, by which he could see the monster without looking at her (for that would have changed him into stone); the latter, a sickle, while the nymphs provided him with winged sandals, and a helmet of Hades, or invisible cap. After numerous wonderful adventures, he reached the abode of Medusa, who dwelt near Tartessus, on the coast of the ocean, and succeeded in cutting off her head, which he put into a bag, and carried off. On his return, he visited Ethiopia, where he liberated and married Andromeda, by whom he subsequently had a numerous family, and arrived at Seriphos in time to rescue his mother from the annoyance of the too ardent addresses of Polydectes, whom, along with some of his companions, he changed into stone. After this he went to Argos, from which Acrisius fled to Thessaly, and Perseus assumed the vacant throne. But this, like many other details of the myth, is differently narrated. Perseus was worshiped as a hero in various parts of Greece, and, according to Herodotus, in Egypt too. In ancient works of art, the figure of Perseus much resembles that of Hermes.

PERSEVERANCE OF SAINTS, a doctrine necessarily resulting from the most essential parts of the Calvinistic system, and therefore held by almost all who adopt the Calvinistic or Augustinian doctrines. It is advocated not only by arguments from other doctrines, as those of election, atonement, the intercession and mediatorial dominion of Christ, imputed righteousness and regeneration, but also from many texts of Scripture, as those which declare *eternal life* to be always connected with believing, and those which encourage the believer to depend on the faithfulness, love, and omnipotence of God. To an objection very commonly urged against it, that it tends to make men careless concerning virtue and holiness, its advocates reply that this objection is only valid against a doctrine very different from theirs, the true doctrine of perseverance of saints being one of perseverance in holiness, and giving no encouragement to a confidence of final salvation which is not connected with a present and even an increasing holiness.

PERSHORE, a market t. in the co. of Worcester, and 9 m. s.e. of the city of that name, on the Avon. It contains two churches—that of St. Andrew's, small and ancient; and the church of the holy cross, in Norman and early English, with a lofty square tower. This church is the only remaining portion of the ancient abbey-church of the same name. Pop. '91, 2,631, who are employed in the engineering and machine works and in the stocking manufactories, and in raising fruits and vegetables for the markets of the large manufacturing towns in the vicinity.

PERSIA, called by the natives IRAN (see ARYAN RACE), the most extensive and powerful native kingdom of western Asia, is bounded on the n. by the great plain of Khiva, the Caspian sea, and the trans-Caucasian provinces of Russia: on the e. by Bokhara, Afghanistan, and Beloochistan; on the s. by the strait of Ormuz and the Persian gulf, and on the w. by Asiatic Turkey. It extends 900 m. from e. to w., and 700 m. from n. to s., and has an area of about 628,000 miles. It consists for the most part of a great table-land or elevated plateau, which in the center and on the east side is almost a dead level; but on the n., w., and s. is covered with mountain-chains. The province of Azerbijan, in the n.w., is almost wholly mountainous. From its southern boundary, the majestic range of the Elburz runs eastward, following the line of the Caspian coast at a distance varying from 12 to 60 miles. On reaching Astrabad, the mountains sink into ridges of lower elevation, one of which joins the Paropamisus in Afghanistan. A hill country lies n. of this line; it terminates in the Daman-i-koh chain, which sinks abruptly to the low plain of Turkistan. South and e. of Azerbijan, a broad mountain-belt traverses Persia from n.w. to s.e., the chains and valleys of which it consists lying in the same direction. To this region belong the mountains running from Hamadan to Shiraz, many of the peaks of which are clad with perpetual snow; and the Zagros mountains and Pushti Kuh on the western frontier. The Persian mountains are mostly primitive; granite, porphyry, feldspar, and mountain-limestone enter largely into their composition. They also exhibit indications of volcanic action—Taftan, south of lake Zirreh, or Zamoon, being an active, and Demavend an extinct volcano; and the destructive earthquakes which are still of frequent occurrence in the n. and n.w. of Persia, indicate the presence of subterranean fires. The Persian plateau, which lies in an angle formed between these mountains, and spreads eastward to the plateau of Afghanistan, ranges from 2,000 to 5,000 ft. above sea level, the lowest portion being the great salt desert in the s.w. of Khorassan, which has 2,000 ft. of elevation above the sea; while the average elevation of the whole plateau above the sea is about 3,700 feet.

Almost the whole of Khorassan (q.v.), the n. half of Kerman (q.v.), the e. of Irak-Ajemi (q.v.), which form the great central plain, and detached portions of all the other provinces, with the exception of those on the Caspian sea, forming more than three-fourths of the surface of Persia, are desert. In some parts of this waste the surface is dry, and produces a scanty herbage of saline plants; in other parts, it is covered with salt marshes, or with a dry, hard, salt crust, sometimes of considerable thickness, which glitters and flashes in the sunlight, forcing the traveler on these inhospitable wastes to wear a shade to protect his eyes; but by far the greater portion of this region consists of

sand, sometimes so light and impalpable as to be shifted hither and thither by the slightest breeze. This great central desert contains a few oases, but none of great extent. A narrow strip of low and level country extends along the shores of the Persian gulf and the strait of Ormuz. It consists of a succession of sandy plains, occasionally interrupted by a plantation of palms near the scanty rivulets which traverse it. It is called Dushtistan, or Gurmsir—that is, the warm region, in opposition to the mountainous districts, called Sirhud, or the cold country.

Although so much of Persia is desert, some parts of the country are of exceeding fertility and beauty; the immense valleys, some of them 100 m. in length, between the various ranges of the Kerman mountains, abound with the rarest and most valuable vegetable productions. Great portions of the provinces of Fars, Khuzistan, Ardelan, and Azerbijan have been lavishly endowed by nature with the most luxuriant vegetation; while the provinces of Ghilan and Mazanderan, which lie between the Elburz and the Caspian sea, and the southern slopes of the Elburz, are as beautiful as wood, water, and a hot climate can make them—the mountain-sides being clothed with trees and shrubs, and the plain, 300 m. long by from 5 to 30 m. wide, studded with mulberry plantations, rice fields, vineyards, orchards, orange grounds, and sugar and cotton plantations.

Rivers.—Persia has hardly one river that can properly be termed navigable, though some of them are several hundred miles in length, and of great width and volume of water; among those of sufficient importance to deserve mention is the Karun, which rises in the mountains to the s. of Ispahan, and falls into the Shat-el-Arab near Mohammerah. The rivers which flow to the southward receive, in the latter part of their course, few tributaries, and fertilize only a narrow strip of land on each side of them, except when their waters are applied, by means of canals or other works, to the artificial irrigation of the soil. This mode of increasing and extending the productive powers of the country was much employed in ancient times; but the constant change of masters, and the never-ending disturbances under which Persia has so long suffered, led to the neglect of the practice, and most of these monuments of the architectural skill and laborious industry of the ancient Persians are now ruinous.

Lakes.—Persia, as a natural consequence of the nature and situation of its surface, abounds with saline lakes, and there are nearly thirty of them having no visible outlets. The chief lake is lake Urumeyah (q.v.), in Azerbijan. Lake Bakhtegan, in the e. of Fars, the receptacle for the drainage of the northern half of that province, is about 60 English m. in length by 9 in breadth. Lake Shiraz is much smaller. Part of lake Zirreh is now included in the frontier of Persia, but it may still be considered as chiefly belonging to Afghanistan.

Climate and Products.—The climate is necessarily very varied. What the younger Cyrus is reported to have said to Xenophon regarding the climate, "that people perish with cold at the one extremity, while they are suffocated with heat at the other," is literally true. Persia may be considered to possess three climates—that of the southern Dushtistan, of the elevated plateau, and of the Caspian provinces. In the Dushtistan, the autumnal heats are excessive, those of summer more tolerable, while in winter and spring the climate is delightful. On the plateau, the climate of Fars is temperate. About Ispahan, the winters and summers are equally mild, and the regularity of the seasons appears remarkable to a stranger. To the n. and n.w. of this, the winters are severe. The desert region of the center and e., and the country on its border, endure most oppressive heat during the summer, and piercing cold in winter. The Caspian provinces, from their general depression below the sea level, are exposed to a degree of heat in summer almost equal to that of the West Indies, and their winters are mild. Rains, however, are frequent and heavy, and many tracts of low country are marshy and extremely unhealthy. Except in the Caspian provinces, the atmosphere of Persia is remarkable above that of all other countries for its dryness and purity.

The cultivated portions of Persia, when supplied with moisture, are very fertile, producing an immense variety of crops. The chief cultivated products are wheat, barley, and other cereals, fruit, gums, cotton, wool, woods, fish, licorice, rice and tobacco. The vine flourishes in several provinces, and the wines of Shiraz are celebrated in eastern poetry. Mulberries are also largely cultivated, and silk is one of the most important products of the kingdom. The forests of the Elburz abound with wild animals, as wolves, tigers, jackals, boars, buffaloes, foxes, and the Caspian cat. Lions and leopards also abound in Mazanderan. Among domestic animals, the horse and camel hold the first place. The horses have always been celebrated as the finest in the east. They are larger and more handsome, but less fleet than the Arabian horses. The Caspian rivers abound with fish, especially sturgeon, great quantities of which are cured and exported to Russia.

Inhabitants.—The settled population are chiefly Tajiks, the descendants of the ancient Persian race, with an intermixture of foreign blood. To this class belong the agriculturists, merchants, artisans, etc. The Tajiks are Mohammedans of the Shiite sect, with the exception of the remaining Parsees or Guebers (q. v.), who are found in Kerman and Fars, and still retain their purity of race and religious faith. The Tajiks have been spoken of as timid, cunning, and servile, but in the cities of Turkistan recently conquered by Russia, they make excellent subjects, ready and apt to adopt and appreciate the knowledge and habits of Europe. In the work quoted below, Vambéry speaks of their industry, and their capacity for and love of culture. He says, that which the Japanese are in the e. the Tajiks may become in the w. of Asia; and it is a settled matter that they will form the medium for the introduction of the civilization of the

west into the interior of Asia. The nomad or pastoral tribes, or eylats (*eyl*, a clan), often spelt *illyats*, are of four distinct races—Turkomans, Kurds, Lûurs, and Arabs. Their organization is very similar to that which formerly subsisted among the Highland clans of Scotland, with the exception that the former are nomad, while the latter inhabited a fixed locality. Each tribe is ruled by its hereditary chief (*ujak*), and under him by the heads of the cadet branches (*tirehs*) of his family. Of the four nomad races, the Turkoman is the most numerous, and forms at the present day the ruling race in Persia. The Kurds are few in number, the greater part of their country and race being under the sway of Turkey. The Arabs are also few in number, and at the present day can hardly be distinguished from the Persians, having adopted both their manners and language. The Lûurs are of nearly pure Persian blood. The nomad races, especially the Turkomans, profess the Sunni creed; they are distinguished from Tajiks by their courage, manliness, and independence of character; but they are inveterate robbers, and since their entrance into the country in the 10th c., it has been continually distracted by civil wars and revolutions. Most of the Mohammedans belong to the Shiite sect and the priesthood is very powerful, its influence being usually exerted against progress of any kind. It is easy to become a priest, the only requirement being a knowledge of the Koran and an ability to interpret its laws. If the priest or mollah prove himself a man of wisdom whose interpretations of the divine law are regarded as just and whose knowledge of the faith and of traditions is extensive, he becomes a *Mujtahid* or chief priest. The Mujtahid of Kerbela in Bagdad is the chief authority in religious matters, and is held by some to be the viceregent of the Prophet. The government does not appoint the chief priest but chooses the chief judge or *Sheikh-el-Islam*, as well as the chiefs of the principal mosques in the cities. The estimates of 1894 placed 8,000,000 of the population as Shiites, 800,000 as Sunnites, and of the non-Mohammedan population, 9,000 Parsees, 45,000 Armenians, 25,000 Jews, and 25,000 Nestorians.

We have no certain information regarding the population of Persia. There can be no doubt that in antiquity, and even during the middle ages, while the irrigation works still fertilized great tracts of country, it supported a great population. A native estimate, referred to by sir John Malcolm, fixed the modern population at 200,000,000. In the 17th c., the French traveler, Chardin, thought 40,000,000 not too high a figure. Later travelers, however, reduced these sums to numbers varying from 15,000,000 to 8,000,000. Much surprise was accordingly expressed when Mr. R. Thomson, who had traveled in every province of Persia, and collected statistical information, made careful calculation from the taxes collected, etc., and reported that the entire population did not exceed 5,000,000, and was probably not over 4,000,000. His estimate was long generally accepted as the most trustworthy, but estimates in 1894 placed the total population at 9,000,000. In 1894 the principal cities with their populations were given as follows:—Teheran, 210,000; Tabriz, 180,000; Ispahan, 80,000; Meshed, 60,000; Barfurush, 50,000; Kerman and Yezd between 40,000 and 45,000; Hamadan, Shiraz, Kazvin, Kom, Kashan, and Resht, between 25,000 and 30,000. The nomad population consisted of about 720,000 Turks; 675,000 Kurds and Leks; 260,000 Arabs; 234,000 Lûurs and 20,700 Baluchis and Gypsies.

The insecurity of property has prevented the improvement of land, the extension of trade, and public works of every kind. The roads are utterly neglected. The houses, those of the wealthiest people not excepted, appear contemptible, being generally built of earth or mud, and are grouped, even in the towns, with little attention to uniformity or order. They scarcely ever exceed one story in height, and they are surrounded by high blank walls. The public buildings, such as mosques, colleges, and caravansaries, are of similar appearance to the ordinary houses, and built of the same materials. The interiors, however, of the houses of the rich are sometimes perfect paradises of luxury and elegance; and however much dwellings constructed of mud may offend a European eye, it is questionable whether, with all its disadvantages, mud is not a better building material than wood or stone in a country possessing such a climate as Persia. The miserable look of the towns is, however, greatly improved by the beauty of the gardens which surround them.

Manufactures and Trade.—The trade of Persia is by no means commensurate with its size and wealth. It has long been hampered by the indifference of the richer classes to commercial and industrial matters. The Shah Muzafer-ed-Din, who succeeded his father in the spring of 1896, showed more of a disposition to encourage trade and industry than his predecessors, but work in this line is hindered by the prejudices of the population. The beauty, as well as the durability, of Persian wares has been celebrated for centuries, although a comparatively small portion of the wealth of the country is turned into industrial capital, and enterprise has been further hindered by the lack of mutual confidence among the people. A large, and of course influential, class have always regarded trade of any sort as degrading. The industrial classes, therefore, had only their own resources to rely upon and have been aided by no national policy for the promotion of home industries. The manufactures of P. have hardly emerged from the domestic stage of industry and some of their finest rugs and carpets are still designed and woven in the tents of the semi-barbarous Kurds and Turkomans, who obtain the wool from their flocks and the dyes from the plants and herbs on their native hills. Cotton is one of the chief articles of export, Russia receiving nearly all of it. A consular report in 1896 estimated the quantity annually exported at about 4,000 tons. The manufacture of raw silk was formerly a very important industry, but between 1875 and 1895 there was a marked decline, and at the end of that period only a small proportion

of the former output was produced. The attempt made toward the end of this period to improve the silk culture by the introduction of new seeds led to a partial and temporary revival. The P. tobacco is well known throughout the world. The best quality is grown in the neighborhood of Shiraz in the province of Fars, but of this little is exported. A large part of the tobacco crop goes to Turkey and Egypt, and the home consumption is large. Opium is another important article of export and the trade in this has increased in consequence of the opposition to its production in India. China now receives a large supply of opium from Persia, and the home consumption has attained considerable dimensions. A well-known export of Persia is asafetida, which is the product of a plant found chiefly in the provinces of Kurman and Yezd. It grows wild, but its preparation requires great care. It is chiefly exported to India, where it is used by the Hindoos as a flavor for food. Some is consumed in P., but it is not used much for medicinal purposes. The preparation of attar of roses, for which P. has long been famous, is still carried on, but to no such great extent as formerly. The export of wool has considerably increased, especially of the coarser quality; the finer and more silky wools are employed at home in the manufacture of rugs and carpets. Persian wheat is of an especially fine quality and the export trade in it is large, the greater part going to England and India. The Caspian sea supplies a large number of sturgeon, from the roe of which caviare, an important article of trade, is obtained. The fisheries are run by Russian Armenians, from whom the Persian government derives a considerable rent. The wines of Shiraz are celebrated in Eastern poetry, but of the best quality a comparatively small quantity is now produced. In flavor it is not unlike sherry. Owing to the absorption of too much water in consequence of the irrigation of the Persian vineyards, the grape yields a wine which deteriorates with age, turning sour or insipid. Carpets and rugs are exported to all parts of the world, being highly valued for the durability of their colors, the artistic character of their designs, and their exquisite workmanship. There is a considerable export trade also in shawls, which are cheaper, and in general not of such fine quality as the Cashmere shawls. The trade in them is for the most part limited to Arabia and Constantinople. Astrakhan is a considerable article of trade. It is made from the skins of very young black lambs, and the best quality produced is from flocks in the neighborhood of Shiraz, but the industry led to so serious a diminution of the flocks, that the Persian government prohibited the exportation of the skins. Much, however, is exported in spite of the law. In the province of Khorassan are famous turquoise mines, the products of which are exported to the countries of the east as well as to most civilized countries, the Persian stones being regarded as superior to those obtained in any other part of the world. The pearl fisheries are also of great value and their rent yields a considerable revenue to the government. They are found in the Persian gulf, and the best pearls, unless they are taken for the Shah's collection, are exported chiefly to London and Paris. As to the imports, P. derives her petroleum supply from Russia; sugar from Russia and France; cloth from Austria, Russia, Belgium, and England; glass, china, and earthenware from Austria; iron from Russia; copper from England; tea from India and China; and coffee from Mocha, India, and Ceylon. Other important articles of import may be classed under the heads of fancy articles, builders' hardware, clocks, watches, etc., leather goods, carriages and harness, tobacco, druggists' wares, musical instruments, canned goods, liquors, dress goods, and firearms.

Government, Taxation, Education, etc.—The government of Persia is a pure despotism, limited only by domestic intrigues, dread of private vengeance, and an occasional insurrection. The last-named is the principal check against unjust government on the part of the monarch, while the former two operate as powerful restraints on his ministers. The monarch, who has the title of "Shah" or Shahinshah (king of kings), possesses absolute authority over the lives and property of his subjects. His deputies, the governors of provinces and districts, possess similar authority over those under them; their actions are, however, liable to revision by the Shah, who may summarily inflict any punishment upon them for real or alleged misgovernment. Oppression of the working and mercantile classes is almost a necessity of such a form of government. The office of *Shadr Azam*, abolished for a time was reinstituted in 1893. There is a ministry, nominally modeled after the cabinets of European states, consisting of the ministers of foreign affairs, of war, of finance, and of the interior. These are the chief ministers, but other departments represented are commerce, treasury and customs, justice, instruction, mines, telegraphs, ports, the press, and religious endowments. The law, which in civil cases is administered by Mollahs (q. v.), in criminal cases by a state court, is founded on the Koran and on tradition. The punishments commonly inflicted are fines, flogging (the bastinado), and death, either by decapitation, stabbing, or torture. The beglerbegs, or governors of provinces, who are always chosen from the governing race, the Turkomans, and are generally of the blood-royal, oppress to the utmost the poor Tajiks. They are seldom able, however, to protect their provinces from the ravages of the predatory eylat hordes, who, though nominally subject to the Shah, are governed by their own khans, and are really independent. The revenue consists principally of money raised by taxes upon towns, villages, and districts, each being required to pay a fixed sum. It is estimated that 82% of the revenue is obtained in this manner, which imposes the heaviest burden on the laboring classes. Of the other sources of revenue the most important is the customs which yield nearly 15%. The balance is obtained from mines, posts and concessions of the government.

Elementary education is very generally diffused among all classes, but consists chiefly of the reading of the Koran. There are, however, numerous colleges which are supported by the state, and in these instruction is given in religion, Persian and Arabic

literature and to some extent in science. The polytechnic school of Teheran, opened in 1849, has attempted with some success to introduce a knowledge of Western literature and science. In the same city, as well as at Tabriz, there are military colleges. For an account of the Persian army, see the article ARMIES, MODERN.

Political Divisions, etc.—From the earliest times down to the present century, Persia was divided into seven or eight great divisions; but about the time when it was attempted to introduce European civilization into the country, and discipline into the army, the country was anew divided into 25 provinces. At present Persia is divided into 22 large and 10 small provinces, each under a governor-general who is responsible to the Shah. There are many interesting ruins of ancient and celebrated cities in Persia—for example, Persepolis (q. v.), Rhages, or Rhé, Shahpur, Istakhar, Tûs, Merv, Shushan, Hamadan, etc. See BEHISTUN.

History.—According to the *Shah Nameh* of Firdusi (q.v.), the history of Persia begins some thousands of years before the Christian era. Little has yet been done towards extracting the grains of historical truth that may be contained in the mass of fable that constitutes the native Persian annals; although hopes are cherished that by aid of the many inscriptions and monuments that are being daily discovered, light may yet be thrown upon many points. In the meantime, we must rest contented with the accounts derived from Greek writers. The north-western part of Iran, anciently called Media (q.v.), was, at the earliest period known to the Greeks, a part of the Assyrian empire, but the Medes revolted, and (708 B.C.), under Dejoces, established an empire which subdued both that of Assyria and their own kindred tribes of Persis. See MEDIA. About 537 B.C., the Persians under Cyrus (q.v.)—the Kai-Khusru of the Persians—(559–529 B.C.) rebelled, subdued their former masters, the Medes (who from this time became amalgamated with them), and established a mighty empire, which included besides Persia, as far as the Oxus and Indus, Asia Minor, Syria, Palestine, and Mesopotamia. His son, CAMBYSES, a most ferocious and blood-thirsty tyrant (529–522 B.C.), subdued Tyre, Cyprus, and Egypt. After the brief rule of the usurper SMERDIS (522–521 B.C.), Darius I. (q.v.), surnamed HYSTASPES—the Gushtasp of the Persians—(521–485 B.C.), mounted the throne. He was a politic and energetic prince, and succeeded in firmly establishing his dynasty, and adding Thrace and Macedonia to his empire; but his two attempts to subdue Greece were completely foiled, the first by the Thracians, and the second by the Athenians at Marathon (490 B.C.). His son, XERXES I. (485–465 B.C.)—the Isfundear of the Persians—renewed the attempt to subdue the Greek states, and though at first successful, the defeats of Salamis and Platæa compelled him to limit himself to a defensive warfare, which exhausted the resources of his kingdom. His son, ARTAXERXES I. (465–425 B.C.), surnamed LONGIMANUS (the Bahman of the Persians, better known as Ardeshir Dirazdust), was a valiant prince, but he was unable to stay the decadence of Persia, which had now commenced. He, however, crushed a formidable rebellion in Egypt, though his wars with the Greeks and Ionians were unsuccessful. The empire now became a prey to intestine dissensions, which continued during the reigns of his successors, Xerxes II., Sogdianus, Darius II., Artaxerxes II., and Artaxerxes III. DARIUS III., CODOMANNUS (336–329) (the Darab II. of the Persians), the last of the dynasty, was compelled to yield his throne to Alexander (q.v.) the great, king of Macedon (known as Secunder by the Persians), who reconquered all the former provinces of Persia, and founded a vast empire, which, at his death in 324 B.C., was divided into four parts, Persia along with Syria falling to the share of the Seleucidæ (q.v.), and its old dependency, Egypt, to the Ptolemies (q.v.). The Seleucidæ soon lost Bactria (now Balkh), which became independent under a series of Greek sovereigns; and about 246 B.C., Parthia (q.v.)—now northern Khorassan—also rebelled under ARSACES I. (the Ashk of the Persian writers), who founded the dynasty of the Arsacidæ, under whom the greater part of Persia was wrested from the Greeks, and maintained against both the Greeks and Romans. The Greek empire of Bactria, which is said to have included a great part of Hindustan, was overthrown by an influx of nomad tribes from Turkistan, and these invaders having been driven out by the Parthians, Bactria was added to their empire. But the dynasty of the Arsacidæ was brought to an end by a Persian named Ardeshir Babegan, who managed to gain possession of Fars, Kerman, and nearly the whole of Irak, before Arduan, the Parthian king, took the field against him. At last, a great battle was fought (218 A.D.) on the plain of Hormuz, in which the Persians were completely victorious. Babegan was now hailed as Ardeshir, king of Persia, and "Shahan Shah," or king of kings. The history of this dynasty will be found under the head of SASSANIDÆ. The Sassanian kings raised Persia to a height of power and prosperity such as it never before attained, and more than once periled the existence of the eastern empire. The last king was driven from the throne by the Arabs (636 A.D.), who now began to extend their dominion in all directions; and from this period may be dated the gradual change of character in the native Persian race, for they have been from this time constantly subject to the domination of alien races. During the reigns of Omar (the first of the Arab rulers of Persia), Othman, Ali, and the Ommiades (634–750), Persia was regarded as an outlying province of the empire, and was ruled by deputy governors; but after the accession of the Abbaside dynasty (750 A.D.), Bagdad became the capital, and Khorassan the favorite province of the early and more energetic rulers of this race, and Persia consequently came to be considered as the center and nucleus of the caliphate. But the rule of the caliphs soon became merely nominal, and ambitious governors, or other aspiring individuals, established independent princi-

palities in various parts of the country. Many of these dynasties were transitory, others lasted for centuries, and created extensive and powerful empires. The chief were the TAHERITES (820–72), a Turkish dynasty in Khorassan; the SOFFARIDES (Persian, 869–903), in Seistan, Fars, Irak, and Mazanderan; the SAMANI, in Transoxiana, Khorassan, and Seistan; the DILEMI (Persian, 933–1056), in western Persia; and the Ghiznevides (q.v.), in eastern Persia. These dynasties supplanted each other, and were finally rooted out by the Seljuks (q.v.), whose dominion extended from the Hellespont to Afghanistan. A branch of this dynasty, which ruled in Khaurezm (now Khiva, q.v.) gradually acquired the greater part of Persia, driving out the Ghiznevides and their successors the Ghurides (see GHÛRI); but they, along with the numerous petty dynasties which had established themselves in the south-western provinces, were all swept away by the Mongols (q.v.) under Genghis-khan (q.v.) and his grandson, Hulaku-khan, the latter of whom founded a new dynasty, the PERSO-MONGOL (1253–1335). This race becoming effeminate, was supplanted by the EYLKHANIANS in 1335, but an irruption of the Tartars of Turkistan under Timur (q.v.) again freed Persia from the petty dynasties which misruled it. After the death of Timûr's son and successor, shah Rokh, the Turkomans took possession of the western part of the country, which, however, they rather preyed upon than governed; while the eastern portion was divided and subdivided among Timûr's descendants, till, at the close of the 15th c., they were swept away by the Uzbeks (q.v.), who joined the whole of eastern Persia to their newly founded khanate of Khiva. A new dynasty now arose (1500) in western Persia, the first prince of which (Ismail, the descendant of a long line of devotees and saints, the objects of the highest reverence throughout western Persia), having become the leader of a number of Turkish tribes who were attached by strong ties of gratitude to his family, overthrew the power of the Turkomans, and seized Azerbijan, which was the seat of their power. Ismail rapidly subdued the western provinces, and in 1511 took Khorassan and Balkh from the Uzbeks; but in 1514 he had to encounter a much more formidable enemy—to wit, the mighty Selim (q.v.), the sultan of Turkey, whose zeal for conquest was further inflamed by religious animosity against the Shiites, or "Sectaries," as the followers of Ismail were termed. The Persians were totally defeated in a batttle on the frontiers; but Selim reaped no benefit from his victory, and after his retreat, Ismail attacked and subdued Georgia. The Persians dwell with rapture on the character of this monarch, whom they deem not only to be the restorer of Persia to a prosperous condition, and the founder of a great dynasty, but the establisher of the faith in which they glory as the national religion. His son Tamasp (1523–76), a prudent and spirited ruler, repeatedly drove out the predatory Uzbeks from Khorassan, sustained without loss a war with the Turks, and assisted Homayun, the son of Baber, to regain the throne of Delhi. After a considerable period of internal revolution, during which the Turks and Uzbeks attacked the empire without hindrance, shah Abbas I. the great (1585–1628), ascended the throne, restored internal tranquillity, and repelled the invasions of the Uzbeks and Turks. In 1605 he inflicted on the Turks such a terrible defeat as kept them quiet during the rest of his reign, and enabled him to recover the whole of Kurdistan, Mosul, and Diarbekir, which had for a long time been separated from Persia; and in the east, Candahar was taken from the great Mogul. Abbas's government was strict, but just and equitable; roads, bridges, caravansaries, and other conveniences for trade, were constructed at immense expense, and the improvement and ornamentation of the towns were not neglected. Ispahan more than doubled its population during his reign. His tolerance was remarkable, considering both the opinions of his ancestors and subjects; for he encouraged the Armenian Christians to settle in the country, well knowing that their peaceable and industrious habits would help to advance the prosperity of his kingdom. His successors, shah Sufi (1628–41), shah Abbas II. (1641–66), and shah Soliman (1666–94), were undistinguished by any remarkable talents, but the former two were sensible and judicious rulers, and advanced the prosperity of their subjects. During the reign of sultan Hussein (1694–1722), a weak, bigoted fool, priests and slaves were elevated to the most important offices of the empire, and all who rejected the tenets of the Shiites were persecuted. The consequence was a general discontent, of which the Afghans (see AFGHANISTAN) took advantage by declaring their independence, and seizing Candahar (1709). Their able leader, Meer Vais, died in 1715; but his successors were worthy of him, and one of them, Mahmud, invaded Persia (1722), defeated Hussein's armies, and besieged the king in Ispahan, till the inhabitants were reduced to the extremity of distress. Hussein then abdicated the throne in favor of his conqueror, who, on his accession, immediately devoted his energies to alleviate the distresses and gain the confidence of his new subjects, in both of which objects he thoroughly succeeded. Becoming insane, he was deposed in 1725 by his brother Ashraf (1725–29); but the atrocious tyranny of the latter was speedily put an end to by the celebrated Nadir shah (q.v.), who first raised Tamasp (1729–32) and his son, Abbas II. (1732–36), of the Suffavean race, to the throne, and then, on some frivolous pretext, deposed him, and seized the scepter (1736–47). But on his death, anarchy again returned; the country was horribly devastated by the rival claimants for the throne; Afghanistan (q.v.) and Beloochistan (q.v.) finally separated from Persia, and the country was split up into a number of small independent states till 1755, when a Kurd, named Kerim-khan (1755–1779), abolished this state of affairs, re-established peace and unity in western Persia.

and by his wisdom, justice, and warlike talents acquired the esteem of his subjects, and the respect of neighboring states. After the usual contests for the succession, accompanied with the usual barbarities and devastations, Kerim was succeeded in 1784 by Ali-Murad, Jaafar, and Luft-Ali, during whose reigns Mazanderan became independent under Aga-Mohammed, a Turkoman eunuch of the Kajar race, who repeatedly defeated the royal armies, and ended by depriving Luft-Ali of his crown (1795). The great eunuch-king (as he is frequently called), who founded the present dynasty, on his accession announced his intention of restoring the kingdom as it had been established by Kerim khan, and accordingly invaded Khorassan and Georgia, subduing the former country almost without effort. The Georgians besought the aid of Russia; but the Persian monarch, with terrible promptitude, poured his army like a torrent into the country, and devastated it with fire and sword; his conquest was, however, hardly completed when he was assassinated, May 14, 1797. His nephew, Futteh-Ali (1797–1834), after numerous conflicts) fully established his authority, and completely subdued the rebellious tribes in Khorassan, but the great commotions in western Europe produced for him bitter fruits. He was dragged into a war with Russia soon after his accession, and by a treaty, concluded in 1797, surrendered to that power Derbend and several districts on the Kur. In 1802 Georgia was declared to be a Russian province. War with Russia was recommenced by Persia, at the instigation of France; and, after two years of conflicts disastrous to the Persians, the treaty of Gulistan (Oct. 12, 1813) gave to Russia all the Persian possessions to the n. of Armenia, and the right of navigation in the Caspian sea. In 1826 a third war, equally unfortunate for Persia, was commenced with the same power, and cost Persia the remainder of its possessions in Armenia, with Erivan, and a sum of 18,000,000 rubles for the expenses of the war. The severity exercised in procuring this sum by taxation so exasperated the people that they rose in insurrection (Oct. 12, 1829), and murdered the Russian ambassador, his wife, and almost all who belonged to or were connected with the Russian legation. The most humiliating concessions to Russia, and the punishment by mutilation of 1500 of the rioters, alone averted war. The death of the crown-prince, Abbas-Mirza (q.v.), in 1833, seemed to give the final blow to the declining fortunes of Persia, for he was the only man who seriously attempted to raise his country from the state of abasement into which it had fallen. By the assistance of Russia and Britain, Mohammed-shah (1834–48), the son of Abbas-Mirza, obtained the crown. He conceived ambitious ideas of annexation. In the days of Nadir-shah, and indeed at many other periods, the Persian frontier had extended over a great part of the Afghan, Belooch, and Khivan boundary. Mohammed resolved to demand reacknowledgment of sovereignty from his alleged vassals in these countries, but an attempt he made to re-annex Herat, "the key to India," was resisted by England. The war was terminated in 1838 by the landing of a small sepoy force on the shores of the Persian gulf. Nasr-ed-din succeeded to the throne on his father's death in 1848; and the new government announced energetic reforms, but failed as completely as those which had preceded it in carrying them out. Following his father's example, the new shah resolved to reassert his claims in Afghanistan and Beloochistan. The ruler of Herat having recognized the claims of Persia, the English government remonstrated with the shah, and he was compelled to sign an engagement on Jan. 25, 1853, by which he became bound not to interfere further with the internal affairs of Herat. In Oct., 1856, however, on the pretext that Dost Mohammed, the ameer of Cabul, was about to invade Herat, the Persians again took the city. Having thus violated the terms of the treaty with Britain, war was declared against them, and a British army was landed on the coast of the gulf, which, under gens. Outram and Havelock, repeatedly defeated the Persians, and compelled them to restore Herat (July, 1857). In 1868 the Persians occupied Seistan, a province claimed by the Afghans, and extended their jurisdiction over the western third of the country appearing on our maps as Beloochistan. To put an end to the incessant strife to which these pretensions gave rise, the Persians at length agreed with the ameer of Afghanistan and the khan of Kelat to refer the questions in dispute to an English commissioner. Gen. sir Frederick Goldsmid accordingly visited the eastern frontier of Persia, and in 1872 delivered his award. It carried the Belooch frontier back from 58° to 63° e. long., so as to include in Persia the inland town of Jalk, and Guadar on the Indian Ocean. In 1870 the Russians admitted that the jurisdiction of Persia should extend over the whole basin of the Atrek. In 1873 Nasr-ed-din visited several of the European courts; in 1878 he visited Russia; and in 1889 again made a tour in Europe. As a ruler he was energetic and severe. His policy was largely under the influence of the Russian court, though for a time after the failure of his attempt to restore the Persian dominion over Herat, he maintained a somewhat friendly attitude toward Great Britain. He put down revolts and conspiracies with a high hand, but, through the sale of the tobacco monopoly to English speculators, he offended many of his subjects, and his unpopularity was increased by the scarcity of food in several of the provinces in subsequent years. In 1896 a *mollah*, an adherent of a seditious sect, who had been banished from Persia in 1891, shot and killed the Shah while the latter was entering a shrine near Teheran (May 1st). His son, Muzaffer-ed-din, was soon afterwards proclaimed Shah, on June 8th, and the murderer of his father was hanged a few weeks later. The new Shah reduced the taxes on food, proclaimed that public office should henceforth be awarded

on merit, and without consideration of money, and declared that he would rule without a grand-vizier, assuming himself the presidency of the cabinet of 12 ministers.

PERSIAN ARCHITECTURE. The architecture of Persia is of considerable interest, both on its own account and as supplementary to and explanatory of that of Assyria, which, together with the similar edifices in Egypt, is the earliest architecture of which we have any knowledge. The buildings of Persia and Assyria closely resemble one another, and, owing to the mode and the materials in which they were constructed, their remains serve to illustrate and complete each other's history. In Assyria, where no solid building-materials exist, the walls are composed of masses of sun-dried brickwork, lined on the inside, to a certain height from the floor, with large sculptured slabs of alabaster. These have been preserved to us by the falling in of the heavy earthen roofs, with which, as the later Persian buildings explain to us, the Assyrian palaces were covered. The explorations of Layard and Botta, and the specimens brought home by the former, and now in the British museum, have made these sculptures familiar to us. The subjects usually are large bulls with human or lions' heads; priests with human bodies, and eagles' or lions' heads, performing religious service before the "sacred tree." The Assyrian remains are all of palace-temples, buildings somewhat resembling the Egyptian temples (which were also palaces); and many of the sculptures represent the exploits of the king in war and in peace. The palaces are always raised on lofty artificial mounds, and approached by magnificent flights of steps.

The buildings of Assyria extend over a very long period, the oldest at Nimroud being from 1300 to 800 B.C., and the more recent at Khorsabad and Koyunjik from 800 to 600 B.C. To these succeeded Babylon in the reign of Nebuchadnezzar, and the Birs Nimroud; but these are mere masses of decomposed brickwork, without any sculptures of harder material.

After Babylon came Pasargadæ—where the splendid palaces of Cyrus and Cambyses still exist in ruins—and Persepolis, the capital of Darius and Xerxes (560–23 B.C.), and some remains are still to be found at Susa, Ecbatana, and Teheran. At Persepolis we find the very parts preserved which at Nimroud and Khorsabad are wanting; for here there is abundance of stone, and the pillars, walls, doorways, etc. (which, in the early examples, were no doubt of wood, and have decayed) being of stone, are still preserved. This has enabled Mr. Fergusson to "restore" these buildings, and to produce most interesting designs, showing not only how the palaces of Persia were constructed and lighted, but from them to suggest how the arrangements of all the ancient architecture of Egypt and Syria must have been designed.

The halls at Persepolis were square in plan, having an equal number of pillars in each direction for the support of the roof, which was flat. In the center a portion was left open for the admission of light, and sheltered by another roof raised upon pillars. The great hall of Xerxes is the most splendid building whose remains exist in this part of the world. The remains of the 72 columns with which it was adorned, are still extant. The hall had 36 columns, six on each side, and on three sides had an external portico, each with two rows of six columns. These columns had capitals, composed of bulls' heads and shoulders (Fig. 1), between which the beams of the roof rested; while others were ornamented with scrolls like the Ionic order (Fig. 2). The bases are also suggestive of the origin of that Greek style. This hall was 350 ft. by 300, and covered more ground than any similar buildings of antiquity, or any mediæval cathedral except that of Milan. The palaces of Persepolis stand on lofty platforms, built with walls of Cyclopean masonry, and approached by magnificent flights of stairs, adorned, like the palaces, with sculptures somewhat similar to those of Assyria. The interiors were ornamented with paintings. The use of the arch was known in Assyria, as has been shown by the subterranean arched conduits discovered by Layard, and

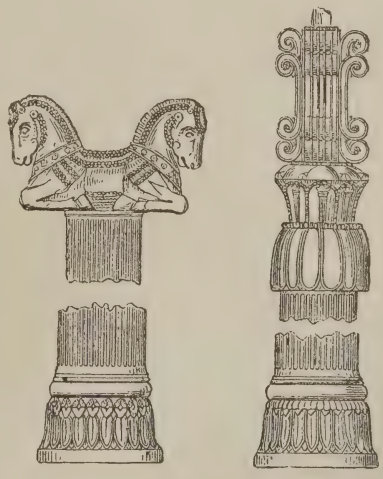

Fig. 1. Fig. 2.

Details of Persian Architecture.

the gates of Khorsabad discovered by M. Place. The arches of the latter spring from the backs of sculptured bulls, and are beautifully ornamented with enameled bricks.

PERSIAN GULF, an arm of the Indian ocean which penetrates between Arabia and Persia to the extent of 420 English m. in a general north-westerly direction. Its depth varies between 20 and 45 fathoms. Its breadth varies from 105 m. to 250 m., and the area is estimated at 117,300 sq. m., from which about 1930 sq. m. must be subtracted for the islands, which are scattered over the western half, or lie close inshore along the eastern side. The chief of these islands are Ormuz (q.v.), at the mouth, Kishm, and the Bahrein islands (q.v.), around which last a considerable pearl fishery is carried on. The coast is mostly formed of calcareous rocks. On the Arabian side it is low and sandy, occasionally broken by mountains and cliffs; while, on the Persian side, it is higher and abrupt, with deep water close inshore, owing to the mountain-ranges of Fars and Laristan running close to the water's edge. The islands are partly of limestone and partly of ironstone, and are generally destitute of springs, barren, desolate, and presenting numerous traces of volcanic eruptions. With the exception of the Shat-el-Arab, which is formed by the confluence of the Tigris and Euphrates (q.v.), the Persian gulf receives only insignificant streams. Its eastern side presents abundance of good anchorage, either in the numerous bays or in the lee of islands. Persia has three quite important ports on her shore of the gulf—viz., at Bunder Abbas, Bushire, and Singali. A submarine telegraph cable extends from the Euphrates to Karachi. The order of the periodic currents in this gulf is precisely the reverse of that of the Red sea (q.v.) currents, as they ascend from May to October, and descend from October to May.

Oriental geographers give to this gulf the name of the "Green sea," from a remarkable strip of water, of a green color, which lies along the Arabian coast. It is strange that from the time of Nearchus, the admiral of Alexander the Great, who was the first to make the Persian gulf known to Europeans, the Persians have never ruled supreme over its surface.

PERSIAN LANGUAGE AND LITERATURE. The ancient and modern idioms of Persia, which are in general designated as Iranian or West Aryan, belong to the great class of the Indo-Germanic languages; but the term Persian itself applies more particularly to the language as it is now spoken, with a few exceptions, throughout Persia, and in a few other places, formerly under Persian dominion, like Bokhara, etc. The more important and better known of the ancient idioms are (1) the *Zend* (the East Iranian or Bactrian language, in two dialects—the "Gâtha idiom," and the "ancient" or "classical Zend"), which died out in the 3d c. B.C.—one of the most highly developed idioms, rich in inflections, in the verbs as well as in the nouns, and in the former almost completely agreeing with Vedic Sanskrit; yet such as we find it in the small remains which have survived, it is no longer in the full vigor of life, but almost decaying, and grammatically somewhat neglected; it is in fact held by a great authority on the subject (Haug), that the grammar was never fixed in any way by rules. To increase the difficulty still more, the texts—the Zoroastrian books—never seem to have been copied with proper care, or by men who had any correct knowledge of the language; so that the critical restoration of the literary remains is matter of extreme difficulty, and Zend studies in general may be said to be in their infancy yet. Geographically, this idiom may be placed in northern Persia. Its alphabet is of Semitic origin, and the writing goes from right to left (see AVESTA, ZOROASTER). (2) *Ancient Persian*, the chief remnants of which are found in the cuneiform inscriptions of the time of the Achæmenides, discovered in the ruins of Persepolis, on the rock of Behistun, and some other places of Persia (see CUNEIFORM). Some relics, chiefly consisting of proper names for gods and men, and terms for vessels and garments, have survived in the writings of the classical period, and in the Bible, chiefly in Daniel. This idiom is much nearer to Zend and Sanskrit than to modern Persian. It has still the structure of an ancient organic Indo-Germanic language, with the distinct peculiarities of an Iranic tongue. (3) *Pehlevi* (q.v.) (West Iranian, Median, and Persian), in use during the period of the Sassanides (3d to 7th c. A.D.), an idiom largely mixed with Semitic words, and poorer in inflections and terminations than Zend. Its remnants consist of a certain number of books relating to the Zoroastrian religion, of coins and inscriptions; and the language is not quite the same in all cases—according to the larger or smaller infusion of foreign words. The non-Iranian element is known as Huzvaresh, and is simply Chaldee; while the Iranian element is but little different from modern Persian. There are three distinct idioms to be distinguished in Pehlevi, and the writing varies accordingly, yet it is not certain whether the difference arises from their belonging to different districts or periods. When, however, Pehlevi ceased to be a living language, and the restoration of the pure Iranian had begun, people, not daring to change the writings, chiefly of a sacred nature, as they had descended to them from the Sassanian times, began to substitute, in reading, the Persian equivalents to the Huzvaresh words. At last a new form of commentaries to the sacred writings sprang up, in which more distinct and clear Zend characters were used, where each sign has but one phonetical value, and where all the foreign Huzvaresh words were replaced by pure Persian ones; and this new form was called (4) *Pâzend*. The transition from the ancient to the

modern Persian is formed by the *Parsee*, or, as the Arabs call it, *Farsi*, in use from 700 to 1100 A.D., once the language purely of the south-western provinces, and distinguished chiefly by a peculiarity of style, rigid exclusion of Semitic words, and certain now obsolete forms and words retained in liturgic formulas. It is the Persian once written by the Parsees or fire-worshipers, and is in other respects very similar to the present or *modern Persian*, the language of Jâmi, Nizâmi, and Hâfiz—from 1100 to the present time—with its numerous dialects. The purest dialect is said to be that spoken in Shiraz and Ispahan and their neighborhood. In general, the language is pronounced by universal consent to be the richest and most elegant of those spoken in modern Asia. It is the most sonorous and muscular, while at the same time it is the most elegant and most flexible of idioms; and it is not to be wondered at that, throughout the Moslem and Hindu realm, it should have become the court language, and that of the educated world in general; holding a position somewhat similar to that which the French language held up to within a recent period in Europe. Its chief characteristic, however, is the enormous intermixture of Arabic words, which, indeed, almost make up half its vocabulary. Respecting its analytical and grammatical structure, it exhibits traces only of that of the ancient dialects of Zend and Achæmenian, of which it is a direct descendant. The elaborate system of forms and inflections characteristic of those dialects has been utterly abandoned for combinations of auxiliary words, which form independent connective links, and which impart fullness and an incredible ease to speech and composition, but which, at the same time, correspond as little to the classical notion of inflection. The grammar of the Persian language has been called "regular;" but the fact is, that there is hardly any grammar worth mentioning—at all events, no grammar the rules of which could not be mastered in the briefest possible period. To begin with: there is no gender distinguished in declension; the plural is always formed in the same manner, the only distinction consists in animate beings receiving the affix *ân*, while the inanimate are terminated in *hâ;* further, that instead of the inflection in the different cases found in the ancient languages, either a *mar* (hitherto unexplained) is prefixed, or a *râ* (*râh* = way, by reason of, Pehlevi, Parsi) is affixed. Between the genitive and the word which governs it, also between a noun and its following adjective, an *i* is inserted. This is the whole declension, not only of the noun, but also of the adjective and pronoun. The comparative is formed, as in the mother-tongues, by the addition of *ter;* the superlative adds *terîn*, which is New-Persian exclusively. Not even the pronouns have a gender of their own; the distinction between masculine and feminine must be expressed by a special word, denoting male or female. There is no article, either definite or indefinite. Singularity of a noun is expressed by an appended *ê*, a remnant of *aêva*, one. The flection of the verb is equally simple. There is a set of personal terminations for all tenses: *am, i, ad* or *ast; êm, êd, nd;* the infinitive ends in *tan* or *dan*, the past participle in *tah* or *dah*. The aorist is formed by adding to the root the terminations *am, i, ad; em, ed, and;* the preterite by dropping the *n* of the infinitive, and substituting the usual terminations. The prefix *mi* or *hami* (Parsi and Huzvaresh = always) transforms the preterite into the imperfect; while the prefix *bi* or *bih* (the present of the verb "to will") alters the aorist into the simple future. The other tenses are compounds of the past participle and auxiliary verbs, as in the Teutonic and other modern tongues. The passive is formed by the various tenses of the verb *shudan*, "to be, to go, to beware," being placed after the past participle. As to syntax, there is none, or, at all events, none which would not come almost instinctively to any student acquainted with the general laws of speech and composition. As the time of its greatest brilliancy may be designated that in which Firdusi wrote, when Arabic words had not swamped it to the vast degree in which it is now found, and were still, as far as they had crept in, amenable to whatever rules the Persian grammar imposed upon the words of its own language.

In the history of the Persian writing, three epochs are to be distinguished. First, we have the cuneiform (q.v.), by the side of which there seems, however, to have been in use a kind of Semitic alphabet for common purposes. This, in the second period, appears to have split into several alphabets, all related to each other, and pointing to a common Syriac origin (such as the different kinds of Pehlevi characters and the Zend alphabet) cleverly adapted to the use of a non-Semitic language. In the third period, we find the Arabic alphabet enlarged for Persian use by an addition of diacritical points and signs for such sounds as are not to be found in Arabic (*p, ch, zh, g*). The characters are written in a somewhat more pending manner (Talik) in Persian, and the writing is thus slightly different from the usual Arabic Neskhi.

The much-spoken-of close connection between German and Persian—both of Indo-Germanic kin—is neither more nor less than a popular fallacy, caused by a misunderstood dictum of Leibnitz: "Integri versus Persice scribi possunt quos Germanus intelligat," which was enthusiastically taken up and "proved" by Adelung, Hammer-Purgstall, and others, and which has even led to the assumption, that the Germans came direct from Persia, or that the Goths once were mixed with the Persians. We only mention it as a philological absurdity of bygone days.

Of the literature of the Persians before the Mohammedan conquest, we shall not speak here, but refer to the special articles AVESTA, PEHLEVI, PARSEES, etc. The literary period now under consideration is distinguishable by the above-mentioned infusion of Arabic

words into the Persian language, imported together with the Koran and its teachings. The writers are, in fact, one and all, Mohammedans. With the fanaticism peculiar to conquering religions, more particularly to Islam, all the representatives of old Persian literature and science, men and matter, were ruthlessly persecuted by Omar's general, Saad Ibn Abi Wakkas. The consequence was, that for the first two or three centuries after the conquest, all was silence. The scholars and priests who would not bow to Allah and his prophet and to the new order of things, and who had found means to emigrate, took with them what had not been destroyed of the written monuments of their ancient culture; while those that remained at home were forced to abandon their wonted studies. Yet, by slow degrees, as is invariably the case under such circumstances, the conquered race transformed the culture of the conquerors to such a degree, that native influence soon became paramount in Persia, even in the matter of theology—the supreme science. It is readily granted by later Mohammedan writers, that it was out of the body of the Persians exclusively that sprang the foremost, if not all, the greatest scholars and authors on religious as well as grammatical subjects, historians and poets, philosophers and men of science; and the only concession they made consisted in their use of the newly imported Arabic tongue. A further step was taken when, after the Islam sway had ceased, the Persians, under upstart native dynasties, returned also to the ancient language of their fathers during the first centuries of Mohammedanism. The revived national feeling, which must have been stirring for a long time previously among the masses, then suddenly burst forth in prose and in verse, from the lips of a thousand singers and writers. The literary life of Persia, the commencement of which is thus to be placed in the 9th c. A.D., continued to flourish with unabated healthy vigor for five centuries, and produced a host of writers in every branch of science and belles-lettres, of whom we can only here give the most rapid of surveys, referring for the most important names to the special articles throughout this work. Beginning with poetry, we hear, under the rule of the third of the Samanides, Nasr (about 952), of Abul Hasan Rudegi, the blind, who rose by the king's favor to such an eminence that he had 200 slaves to wait upon him. But little has remained of his 1,300,000 distichs, and of his metrical translation of Bidpai's fables. About 1000 A.D., we hear of Kabus, the Dilemite prince, as the author of *The Perfection of Rhetoric*, and poems. In the time of the Gasnevides, chiefly under Mahmud, who surrounded himself with no less than 400 court-poets, we find those stars of Persian song, Ansari (1039), the author of *Wamik and Asra*, and 30,000 other distichs and Kassidahs in honor and praise of the king; further, Ferruchi, who, besides his own poems, also wrote the first work on the laws of the Persian metrical art; and above all Firdusi (q.v.), that greatest epic poet, the author of the *Shah-Nameh*, or Book of Kings; who led one of the most brilliant and romantic lives that ever fell to the lot of genius, and ended it forgotten and in misery. With him, but darkened by his brightness, flourished Esedi, his countryman, from Tus. Among the poets who flourished under the Atabek dynasty, we find that most brilliant Persian panegyrist, Anhad Addin Enweri, who, with his praise, well knew how to handle satire. The best of the older mystic poets of that period is Senayi, author of 30,000 distichs, who for his poem *Hadikat* was nominated official singer of the Sufis. Nizami (about 1200) is founder of the romantic epos; the greater part of his *Chamshe*, or collection of five romantic poems (*Chosru and Shirin, Mejnun and Leila*, etc.), being almost as well known in Europe as it is in the east; and to whom Kisilarslan the king presented for one of these poems no less than fourteen estates. His grave at Gendsheh is still visited by many a pious pilgrim. And here we must mention that the branch of eastern theosophical literature pre-eminently cultivated in Persia is the mystic (Sufistic) poetry, which, under Anacreontic allegories, in glowing songs of wine and love, represented the mystery of divine love and of the union of the soul with God (see SUFISM). In this province we find chiefly eminent poets like Senâji (about beginning of 13th c.), and Ferid Eddin Attar (born 1216), the renowed author of *Pend Nameh* (Book of Counsel), a work containing the biographies of saints up to his day. His principal strength, however, lay in his mystic poems; and such is the depth and hidden meaning of his rhymes, that for centuries after him, the whole Moslem world has busied itself with commentaries and conjectures on the meaning of a great part of his sacred poetry. He died about 1330, more than a hundred years old, as a martyr. Greater still, in this peculiar field, is Djalal Eddin Rumi, born at Balkh (died 1266), the founder of a still existing most popular order of dervishes (Mewlewi). His poem on *Contemplative Life* has made him the oracle of oriental mysticism up to this day. He wrote also a great number of lyrical poems, which form, as far as they have been collected for this special purpose, a breviary for the faithful Sufi. Anhadi of Meraga (died 1297) also deserves mention.

The 13th c. cannot better be closed than with Sheik Muslih Eddin Sadi of Shiraz (died 1291), the first and unrivaled Persian didactic poet. His *Bostan* and *Gulistan* (rose and fruit garden) are not only of eastern but also of European celebrity, and most deservedly, embodying as they do all the mature wisdom, the grace, and happiness of composition of a true poet, ripe in years as in experience. At the beginning of the 14th c., we meet several meritorious imitators of Sadi in didactic poetry.

But far above all these, as above all other Persian lyrical and erotic poets, shines Hâfiz (q.v.), the "sugar-lip," who sang of wine and love, and nightingales and flowers.

and who so offended mock-piety that it even would have tried to refuse him a proper burial, had not the oracle of the Koran interposed. After him, the full glory of Persian poetry begins to wane. Among those that came after him, stands highest Djâmi, who died in 1492, a poet of most varied genius, second only in every one of the manifold branches to its chief master—in panegyric to Enveri, in didactic to Sâdi, in romance to Nizami, in mysticism to Jelal-ed-din, in lyric to Sâdi; and he, with these and Firdusi, form the brightest representatives of Persian poetry. Most brilliant, however, is Djâmi as a romantic poet. Of prose works, we have by him a history of Sufis, and an exceedingly valuable collection of epistolary models. Before concluding this branch of literature, we must take notice of the dramatic poetry of the Persians, which is not without merit, but of small extent, and to be compared principally with the ancient French mysteries.

The numerous tales, stories, novels, anecdotes, anthologies, and all the miscellaneous entertaining literature in which Persia abounds—and of which the best known, perhaps, are the adaptation of Bidpai's fables; *Anvari Suheili*, by Husein Vais Kashifi; the *Tutinameh*, or book of parrots, a collection of fairy tales, by Nechshebi; the *Behari-Danish*, by Inajeth Allah, etc.—form a fit transition from poetry to prose, for little more is to be said of Persian poetry after the 15th century. Modern imitations of ancient classical works, such as the New Book of Kings, the *Shahinshah-Nameh*, which treats of modern Persian history; the *George Naméh*, which sings the English conquests in India, etc., are hardly worth pointing out in so brief a summary as ours. Of native writers on the poets, are to be named Dewlet Shah (who describes the poets from the 10th to the 15th c.), Sam Mirsa (the poets of the 16th); and Luft Ali Beg (the poets of modern time). In prose, it is chiefly history which deserves our attention. Able rivals of the great Arabic historiographers sprang up at an early period. For the mythical times, or those of which no knowledge, save through a medium of half-legend, has reached later generations, Firdusi's gigantic epos remains the only source. But after the chroniclers we find Fadhl Allah Reshid Eddin, the vizier of Ghazan, born 1247 at Hamadan, who was executed in 1320. He wrote the *Collector of Histories*, in three volumes, to which he afterwards added a fourth geographical volume: a summary of the history of all Mohammedan countries and times, containing besides a complete history of sects. Worthy and contemporaneous rivals are Fachr Eddin Mohammed Bina Kiti, author of a universal history; and Khodja Abdallah Wassaf, the panegyrist, the model of grand and rhetorical style. His most successful imitator in the 14th c. is Abdel Ressak; and in the 15th, Sheref Eddin Ali Yezdi, who wrote the history of Timûr. Up to that period, pomposity of diction was considered the principal beauty, if not the chief merit, of a classical Persian history. From the 15th c. downwards a healthy reaction set in, and simplicity and the striving after the real representation of facts became the predominant fashion. As the *facile princeps* among these modern historians is to be mentioned, Mirkhond, whose Universal History (*Ranset Essafa*) comprises the period from creation to the reign of Sultan Hasan Beikara, in seven books. After him are to be mentioned his son Khondemir, Gaffari, Moslih Eddin Mohammed Lari, and Abu Tahir, of Tortosa, in Spain, who wrote the *Derab Nameh*, a biographical work on the Persian and Macedonian kings, and the ancient Greek physicians and philosophers.

Among Indian historians—and they form a most important class—who wrote in Persian, we have Mohammed Kasim Ferishtah (1640), who wrote the ancient history of India up to the European conquest; Mohammed Hashim, Abul Fadel Mobarrek (*Akbar Nameh*); further, Abdel Ressak (*History of the Padishahs*), Mirza Mehdi, Gholam Hussein Khan, and others. One of the most recent works of this description is the *Measiri Sultaniye*, which contains the history of the present dynasty of Persia, and which was published in Teheran, 1825, and translated by Bridges (Lond. 1833).

Biographies, legends, histories of martyrs, and the like are legion. Most of the biographies of the prophet, however, are taken from the Arabic.

Little is to be said of Persian productions on special branches of exact science. There are a few works on geography—more generally treated together with history—such as those of Mestafi, Ahmîn Ahmed Rasi, Berdshendi, etc. In theology, little beyond translations of the Koran, and a few commentaries on single chapters, and of some portions of the Traditions (*Sunnah*), has been produced—the Arab works being completely sufficient, in religious matters, for all Mohammedans. For the history of early Persian religion are of importance the *Ulemai Islam* and the *Dabistan*, a description of all the creeds of the east. Jurisprudence has likewise to show little that is original, and not mere translation, partial commentary, or adaptation in Persian. The *Hedadshah*, the *Inadshah*, the *Futawa Alemgiri*, are the most important legal works to be mentioned here. A great deal has been done in the field of medicine, surgery, pharmacy, physical sciences, by Persians; but nearly all their chief works being written in Arabic, they do not concern us here. Mathematics, astronomy, and philosophy have received due attention; rhetoric, the art of letter-writing, metrical and poetical arts, have likewise been cultivated with great assiduity, but few standard works are to be enumerated. Grammar and lexicography found their principal devotees in India; and of dictionaries, the *Ferhengi-Shiuri*, *Burhani Katiu*, and principally the *Heft Kulzum* (the seven seas), by the sultan of Oude, deserve attention. Translations from Greek, Indian, Arabic,

Turkish, and other works into Persian, exist in great abundance, and some of them have paved the way to the knowlege of the original sources in Europe. Chief authorities and writers on the subject of Persian language and literature are Meninsky, Richardson, Lumsden, Forbes, Ibrahim De Lacy, Hammer-Purgstall, Briggs, Jones, Duperron, Stewart, Quatremere, Wilken, Defrémery, Vullers, Iken, Kosegarten, Ouseley, Chodzko, Bland, Sprenger, Graff, Brockhaus, Dorn.

PERSIAN POWDER, a preparation of the flowers of the composite plant, *pyrethrum carneum* or *roseum,* which are dried and pulverized. This powder has wonderful efficacy in destroying noxious insects, and is extensively used for that purpose in Russia, Persia, and Turkey. It has been introduced into France, America, and elsewhere, and has become of great use, not only in ridding houses of their insect pests, but in aiding the horticulturist in protecting his plants. The plant is a native of the Caucasus, where the flowers are gathered wild, and sent to be manufactured chiefly at Tiflis. Its habit is very similar to that of camomile. *Pyrethrum cinerariæ folium,* popularly called buhach, is cultivated in California for similar purposes.

PERSIGNY, Jean Gilbert Victor, Duc de, whose proper name was Fialin, a noted adherent of the emperor Napoleon III., was born at Saint-Germain-Lespinasse, in the department of Loire, Jan. 11, 1808, entered the *ecole de cavalerie* at Saumur in 1826, and obtained an appointment to the 4th regiment of hussars in 1828. At this period Fialin was royalist in his politics; but he soon changed to a liberal, and took an active part in the July revolution. Insubordination, however, led to his final expulsion from the army in 1830. After a brief trial of Saint-Simonianism, Fialin was converted to the Bonapartist cause, dropped the name of Fialin, and took up that of Persigny (from an "hereditary estate"), with the title of vicomte. Introduced to Louis Napoleon by the ex-king Joseph, he at once formed the most intimate relations with the prince, and commenced a career of Bonapartist propagandism throughout France and Germany, in which he displayed extraordinary energy, pertinacity, and fertility of resource. He had the chief hand in the affair of Strasburg, and subsequently apologized for its humiliating failure in a pamphlet entitled *Relation de l'Entreprise du Prince Napoléon Louis* (Lond. 1837), in which he throws the blame of the disaster on "fate." He also took part in the descent on Boulogne, where, like his master, he had the misfortune to be captured, and was condemned to twenty years' imprisonment. His confinement, however, after a short time, became almost nominal, and he beguiled his leisure by literary study, a partial result of which may be seen in his voluminous memoir, addressed to the institute, on the *Utilité des Pyramides d'Egypte* (1844). On the breaking out of the revolution in 1848 Persigny hurried to Paris, and set himself, with his accustomed vigor and swiftness, to organize the Bonapartists. It is hardly too much to affirm that it was this dexterous agitator who made his master president of the republic. He was then appointed aide-de-camp to the president, and maj.gen. of the Parisian national guard—perhaps with a view to future contingencies. In 1849 he was chosen a member of the legislative assembly, and immediately signalized himself in parliament, as he had previously done out of doors, by his absolute devotion to the policy of the Elysée. He was sent to Berlin as ambassador at the close of the same year, and afterward held other high diplomatic offices; took a prominent part in the *coup d'état* of Dec. 1851; and, in Jan. 1852, succeeded M. de Morny as minister of the interior. On the 27th of May following, he married a granddaughter of marshal Ney, when the president conferred on him the title of *comte,* and presented him with 500,000 francs. In 1855 he became ambassador at the English court, which office he held till 1858, and again during 1859 to 1860, leaving on both occasions the most favorable impression on English statesmen, by his talent and diplomatic tact. In the latter year he was recalled, to resume the office of minister of the interior. He laid down the portfolio of this office in June 1863, when the elections of Paris and other large towns showed dissatisfaction with his policy. In September of the same year he was created duke. Thereafter he proved himself in the senate a zealous Bonapartist, till the overthrow of the empire. He did not long survive it, having died in 1872.

PERSIMMON. See Date Plum.

PER'SIUS (Aulus Persius Flaccus), one of the most famous Roman satirists, was b. at Volaterræ in Etruria, 34 A.D. He was of a distinguished equestrian family, was educated under the care of the stoic, Cornutus, lived on terms of intimacy with the most distinguished personages of his time in Rome, among whom were Lucan and Seneca, and died Nov. 24, 62 A.D., in the 28th year of his age. The principal authority for the life of Persius is an abridgment of a "commentary" by one Probus Valerius, which presents the character of the satirist in a most amiable light. Modest and gentle in his manners, virtuous and pure in his whole conduct and relations, he stands out conspicuously from the mass of corrupt and profligate persons who formed the Roman "society" of his age; and vindicated for himself the right to be severe, by leading a blameless and exemplary life. His six satires are very commonly printed with those of Juvenal. They were immensely admired in Persius's own day, and long after, all down through the middle ages. The

church fathers, Augustine, Lactantius, and Jerome, were particularly fond of him—the latter, it is said, has quite saturated his style with expressions of the heathen satirist; but the estimate which modern critics have formed of his writings, in a literary point of view, is not quite so high. They are remarkable for the sternness with which they censure the corruption of morals then prevalent at Rome, contrasting it with the old Roman austerity and with the stoic ideal of virtue. The language is terse, homely, and sometimes obscure, from the nature of the allusions and the expressions used, but his dialogues are the most dramatic in the Latin tongue. The *editio princeps* appeared at Rome in 1470; later editions are those of Isaac Casaubon (Par. 1605), Passow (Leip. 1809), Jahn (Leip., 1843), and Conington (Lond., 1881). Persius has been frequently translated; as many as 14 English, 20 French, and considerably more German versions, being known. The two best English ones are those by Dryden and Conington.

PERSON (Lat. *persona*, a mask) has come, from its original signification, to be applied to the individual wearing the mask, and thus to mean in general an individual, or a numerically distinct being. Beyond the idea of individuality, it involves that of a sentient or intelligent nature, in which it differs from "substance" or "thing." The theological use of the word, although strictly identical with its philosophical signification, is made difficult of apprehension from its being applied to the Christian doctrine of the Trinity, which in itself involves a mystery. Nevertheless, when theologians declare that there are three persons in one God, they intend to strictly convey that each of the three persons is a being individually subsisting and numerically distinct; and the difficulty of apprehension is derived, not from these terms, but from the reconciliation of the numerical distinction of persons with the unity of the divine nature.

The name *persona*, person, was first applied to the Trinity by the Latins; the corresponding Greek word, *prosōpon*, being of later use. The earlier Greek fathers used the word *hypostasis*, substance, where the Latins used *persona*, and considerable controversy for a time grew out of this diverse use. It became apparent, however, that the difference was but of words; and after the condemnation of the Sabellian heresy (see Sabellius), and still more after the council of Nicæa, all ambiguity of words being at an end, the controversy turned upon the substance of the doctrine, in the well-known form of the Arian controversy. See Arius.

PERSONA GRATA (Lat., "an agreeable personage") is an expression used in diplomatic circles to indicate the standing of foreign ministers and ambassadors with the government to which they are accredited. If such an official is an approved representative at the court or capital to which he is sent, he is designated as *persona grata*, and as such is received. If, on the contrary, he have committed such social or political indiscretions as to render him, in the estimation of the government to which he is sent, ineligible for this office, he is considered as not being *persona grata*, and is either not received, or, having been received, is returned to his government. The Foreign Enlistment act issued by England during the Crimean war caused the British minister at Washington, Mr. Crampton, to outrun the limits of discretion in enlisting American recruits for the British army. His conduct in the matter became so offensive to our government that, being no longer *persona grata*, he was summarily dismissed from his post. So in April, 1891, Mr. H. W. Blair, of New Hampshire, who had been appointed by President Harrison, minister to China, was declared by the Chinese government to be *persona non grata*, because of certain public utterances of his on the Chinese question some years before; and, although on his way to China, our government was obliged to recall him.

PERSONAL ACTIONS, in American law, are actions which are brought to try the right to damages for breach of contract, or for injuries to the person or personal estate; in contradistinction to real actions, which were designed to try the right and title to real property.

PERSONAL EQUATION. See Equation, Personal.

PERSONAL EXCEPTION means, in the Roman law, a ground of objection which applies to an individual, and prevents his doing something which, but for his conduct or situation, he might do.

PERSONAL PROPERTY. Things personal may be divided into chattels, chattels real, and choses in action. Chattels comprehend all movable material objects not affixed to the soil. When attached to the soil so as to become a part of it, a chattel is converted into a fixture. See Fixtures. A chattel real is an interest annexed or relating to real estate, as a lease for years. The treatment of chattels real belongs to the law of real property, and they resemble personal property only in this respect, that upon the lessee's death the residue of his term goes to his executor or administrator, and not to the heirs. Any interest in real estate, whose continuance is limited to a certain period, i.e., which is less than a freehold, is a chattel real. Choses (things) in action are rights not enforceable without bringing action to recover a debt, or money or damages for breach of contract or for the commission of a tort connected with a contract. Properly speaking, these were not a species of property, but a right whose enforcement will give the holder a property right. The main legal distinction between real and personal property is that the latter, on the death of its owner, goes to his personal representa-

tives instead of his heirs Anciently, personal property of a deceased intestate went to the king; and afterwards the bishops succeeded to it, holding it absolutely, but being supposed to apply it to pious uses. The statute 13 Edward I., c. 19, ordered the payment by the bishops of the debts of intestates, and the statute 31 Edward III., c. 11, took the right of administration from the bishops and gave it henceforth to "the next and lawful friend of the deceased person intestate," whose appointment was made obligatory on the bishops. Up to the time of the statute of distributions (22 and 23 Charles II. c. 10), the administrator, after paying the debts, was allowed to keep the balance as his own. The statute of distributions compelled the distribution by the administrator of the surplus, under the court's order, among the next of kin, in a definite order. The statute of distributions, in all its main provisions, had been adopted by most of the states. Title to personal property is acquired by occupancy; by transfer by act of the party, as a sale; by transfer by act of the law, as by judgment; by accession, and by prescription.

PERSONALTY, in American law, means all the property which, when a man dies, goes to his executor or administrator, as distinguished from the realty, which goes to his heir-at-law. Personalty consists of money, furniture, stock in the funds; while realty consists of freehold land and rights connected with land. See Intestacy; Kin, Next of.

PERSONIFICATION (called by the Greeks *prosopopœia*) is a figure of rhetoric by which inanimate objects, or mere abstract conceptions, are invested with the forms and attributes of conscious life. Oratory and poetry often derive great power and beauty from the employment of this figure. Nowhere do we find more sublime examples than in the Hebrew Scriptures, e.g., "The sea *saw* it, and fled." Such abstract conceptions as wisdom, justice, charity, are often personified in the gravest and most argumentative compositions.

PERSONNEL, in speaking of an army, represents the officers and soldiers, as opposed to the *matériel,* in which are comprised the guns, provisions, wagons, and stores of every description.

PERSOON, Christian Hendrik, 1755–1837, a physician and botanist, was born of Dutch parents, at the Cape of Good Hope, Africa. He went to Paris about 1802, where he published several interesting works on cryptogamous plants; also, a *Synopsis of Plants* in two volumes.

PERSPECTIVE (Lat. *perspicio,* I look through), is the art of representing natural objects upon a plane surface in such a manner that the representation shall affect the eye in the same way as the objects themselves. The distance and position of objects affect both their distinctness and apparent form, giving rise to a subdivision of perspective into *linear perspective* which, as its name denotes, considers exclusively the effect produced by the position and distance of the observer upon the apparent *form* and *grouping* of objects; while *aërial perspective* confines itself to their *distinctness,* as modified by distance and light. The necessity of attending to the principles of perspective in all pictorial drawing is apparent when we consider, for instance, that a circle, when seen obliquely, appears to be not a circle, but an ellipse, with its shortest diameter in line with the spectator, and its longest at right angles to this. A square, when looked at from a position opposite the center of one of its sides, appears as a trapezoid, the sides which are perpendicular to the direction of vision appearing to be parallel, while the other two appear to converge to a point in front of the spectator, etc. For the same reason, two rows of parallel pillars of equal height, seen from a point between and equidistant from each row, appear not only to converge at the further end, but to become gradually smaller and smaller. An excellent idea of a perspective plan can be easily obtained by interposing a vertical transparent plane (as of glass—a window, for instance) between the observer and the objects of his vision, and supposing that the objects he sees are not seen *through* the glass, but painted *on* it. A sketch made on a glass plane in this position by following with a pencil all the lines and shades of the objects seen through it, the eye being all the time kept quite steady, would form a picture in perfect perspective. In practice, however, it is found, unfortunately, that glass is not a suitable material for sketching on, and that the vertical position is not the most convenient; it is therefore preferable to make a careful study of the effects produced by change of position and distance on the appearance of objects in nature, and, from the results of this to compile a body of rules, by the observance of which painters may be enabled to produce an effect true to nature. After the "scope" (i. e., the number of objects to be introduced, and the distance at which they are to be viewed) of the picture has been determined, and before the design is commenced, it is necessary to draw upon the perspective plan three lines: 1. The *base line,* or *ground line,* which limits the sketch towards the operator, and is the base line of the picture. 2. The *horizontal line,* which represents the ordinary position of the sensible horizon. The height of the horizontal line is about one-third of the height of the picture, when the sketcher is placed at or little above the level of the horizon; but it may rise in a degree corresponding to his increase of elevation till it reaches near to the top of the perspective plan. The general rule is to have a high horizontal line when the view is taken, or supposed to be taken, from an eminence; but when the station is on a level, either

actual or assumed, as is the case when a statue or a mountainous landscape is figured, the horizontal line must be low. The horizontal line in nearly all cases is supposed to be level with the spectator's eye. 3. The *vertical line,* which is drawn from the supposed position of the sketcher, perpendicular to the *ground* and *horizontal* lines, meeting the latter in a point which is called the *point of sight,* or center of the picture. The vertical line has no representative in nature, and is merely a mechanical adjunct to the construction of the picture, all vertical lines in nature being parallel to it in the picture. The

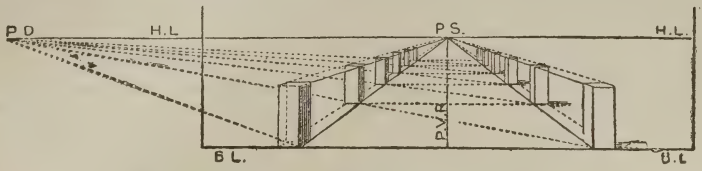

Fig. 1.

Illustrating the more important points and lines ; PVR is the principal visual ray.

point of sight, being the point directly opposite to the observer, is properly placed in the center of the picture, for it is most natural that the view should lie symmetrically on each side of the principal visual line; but this is not by any means a universal rule, for we very frequently find it on the right or left side, but always, of course, on the horizontal line. All lines which in nature are perpendicular to the ground line, or to a vertical plane which is raised upon it as a base, meet in the point of sight, which is thus their *vanishing point* (see the line of the tops and bottoms of the pillars in fig. 1). The *points of distance* are two points in the horizontal line on each side of the point of sight, and in a "direct" sketch are at a distance from it equal to the horizontal distance of the sketcher's eye from the ground line. The equality of distance of these points from the point of sight is not, however, necessary, as it occurs only in those cases where the lines, of which the points of distance are the *vanishing points,* are inclined (in nature) at an angle of 45° to the base line; but, in all cases, the two points of distance are about twice as far apart as the eye is from the picture. One important use of the points of

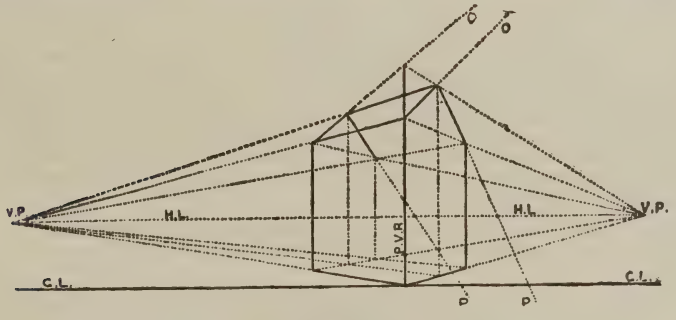

Fig. 2.

The lines O O converge to the accidental point aërial, and P P to the accidental point terrestrial.

distance is to define the distance of objects in a row (fig. 1.) from each other. For this purpose, two points of distance are not necessary, as, when the position of one pillar is found, that of the opposite is at once obtained by drawing a line parallel to the base or ground line. We have seen that the point of sight is the vanishing point of all level lines which meet the ground line or a vertical plane on it at right angles, and that the points of distance (in a *direct* picture) are the vanishing points of all lines which cut the ground line at an angle of 45°; but there are many other groups of parallel lines in a picture which have different situations, and therefore different vanishing points. Such lines with their vanishing points (called, for distinction's sake, *accidental points*) are represented in fig. 2. If the accidental point is above the horizontal line, it is called the *accidental point aërial*—if below, the *accidental point terrestrial;* and a little consideration makes it evident that these points may or may not be situated within the plane of the picture. Such are the points and lines necessary for the construction of a plan in true perspective; and from the above explanation, we may deduce the two general principles: 1. That all parallel straight lines in nature are no longer parallel when projected on the perspective plane, but meet in a point which is called the vanishing point, and is some one of the three above described, unless these lines happen to be also parallel to the ground line or the vertical line, in which case they

remain parallel when transferred to the picture; and 2. That since the bodies drawn below the horizontal line are seen as if from above, those above as if from below, and those to the right and left of the point of sight as if observed from the left and right, it follows, that straight lines which in the picture are above the horizontal line lower themselves, and those below raise themselves to it; those to the left, following the same law, direct themselves to the right, and *vice versâ*.

Aërial perspective, consists in a modulation of the brightness and colors of objects in accordance with the state of the atmosphere, the depth of the body in the perspective plane (i.e., distance in nature from the ground line), and other accidents of place and time. As the distance of objects increases, their illuminated parts are made less brilliant, and their shaded parts more feeble. The bluish tint imparted by a large mass of the atmosphere to the bodies seen through it, is frequently imitated by the mixing of a slight tint of blue with the colors to be applied; a yellow object thus assumes a greenish tint; a red one a violet tint, etc. The air, when charged with vapor, is represented by a diminution of the brightness of colors, and by the grayish tint imparted to them. But in this part of the subject rules are of little avail, for experience alone can guide the painter in faithfully copying the myriad aspects presented by nature.

A thorough knowledge of perspective is a *sine quâ non* to the painter or designer, and though many are inclined to think it a superfluity, and that the sketcher has only to make use of his eyes, and copy justly, the very fact that such is their opinion shows that they have never made the attempt; for it is impossible for the painter, and much more so for the designer, to execute a copy of nature with sufficient accuracy by the sole aid of the eye and hand, a fact that is unfortunately much too frequently proved by many of the sketches exhibited in fine-art collections. Perspective was known to the ancients, but seems to have become extinct during the disturbances that convulsed Italy, and was revived by Albert Dürer, Pietro del Borgo, and Bramantino of Milan (1440), whose body of rules was extended and completed by Peruzzi and Ubaldi about 1600. Dr. Brook Taylor was the first Englishman who discussed the subject scientifically. Works on perspective are now abundant in every language.

PERSPIRATION. See Sweat.

PER STIRPES, a law term of Latin origin (*stirps*, a root), meaning literally "by the stocks" or roots of a race; and used technically as the opposite to *per capita* (q.v.), in the law of succession, to denote descent of property rights not as to individuals but by representation. Thus the descendants or next of kin of A B are said to inherit *per stirpes* when they receive, not equal shares, but such portion as by the laws of descent their immediate ancestor would have been entitled to receive. To illustrate, if A B had five sons, and of these all are alive at the time of his death except C D, who has left three children, and if each of these three children is to receive one-third of the fifth share which would have come to their father if alive, this is succession *per stirpes*. So if all five of A B's sons being dead, the property be divided among the grandchildren so that each group (or the children of each son) receives the same amount. The principle may be applied also to collateral kindred. In most states the statutes provide that if the deceased be intestate and the next of kin stand in degrees of relationship varying in remoteness, the succession shall be *per stirpes*.

PERTH, a co. in s.w. Ontario, watered by the Maitland and Thames rivers, on the Grand Trunk and several other railroads; about 840 sq. m.; pop. '91, 46,307. Co. seat, Stratford.

PERTH, a city, royal, municipal, and parliamentary burgh, and capital of the county of the same name, is situated on the right bank of the Tay, 45 m. n.n.w. of Edinburgh by railway, through Fife. The charming scenery of the immediate vicinity; the Tay, a broad and noble river, sweeping southward along its eastern side; and the superb background of the Grampians on the n., render the site of the "Fair City" exceedingly interesting and beautiful; while its rank, as in some sort the ancient metropolis of Scotland, the important rôle it has played in the history of the country, and the picturesque associations with which history and fiction have invested it, claim for it a high rank among the cities of Scotland. A handsome bridge of nine arches connects the town with the suburb of Bridgend, on the left bank of the river. Further down, the Perth and Dundee railway crosses the river on a fine stone and iron bridge, which also admits foot-passengers. The appearance and salubrity of Perth are much enhanced by two beautiful public parks, called the North and South Inches. The water-supply, obtained from the Tay, is filtered, raised by steam into two elevated reservoirs, and thence distributed over the town, rising to the upper stories of the highest houses. Among the most interesting public buildings are the church of St. John (whence St. Johnstown, or St. John's Town, the old name of the city), an ancient structure in the pointed style, surmounted by a massive square tower; the county buildings, a Grecian edifice; the town-house, part of which is as old as 1210; king James VI.'s hospital; the infirmary; and the local prison. At the head of the South Inch stands the penitentiary, or general prison, one of the largest buildings of the kind in Scotland, where all criminals sentenced to imprisonment for long periods are confined. The town also contains a statue of the late

prince consort; Marshall's monument, erected in honor of a former lord provost, and containing a public library and the museum of the antiquarian society; the public seminaries, Sharp's and other educational institutions. There is a very fine railway station, terminus of both the North British and Caledonian railways. The river is navigable to Perth for vessels of considerable burden. The linen and wincey manufactures are thriving. There are ink, glass, cotton and dye works, iron-foundries, breweries, etc., but shipbuilding has declined. The salmon fishery on the Tay is very valuable. The total quayage of Perth harbor is 1225 ft., and vessels of 200 tons can draw alongside. Perth has a charter as a royal burgh from king William the Lion, 1165–1214. It returns a member to the house of commons. Pop. '96, 30,427. Perth was the scene of a combat between two Highland clans, 1396, described in Scott's *Fair Maid of Perth*, and of Knox's Reformation sermon.

PERTH, a city in s.w. Australia, incorporated 1856; on the n. bank of the Swan river; pop. 8,400. It is the capital of the colony of western Australia, and of the co. of Perth. It is 10 m. n.e. of Freemantle on the Eastern railway, in the vicinity of the Victoria range of mountains, surrounded by picturesque scenery. It is the seat of an Anglican and a Roman Catholic bishopric. The public buildings comprise the government and parliament houses and two cathedrals.

PERTH, The Five Articles of, memorable in the ecclesiastical history of Scotland, were five articles agreed upon in a meeting of the general assembly of the church of Scotland, convened at Perth, by command of James VI., on Aug. 25, 1618. These articles enjoined kneeling at the Lord's-supper, the observance of Christmas, Good Friday, Easter, and Pentecost, and confirmation, and sanctioned the private administration of baptism and of the Lord's-supper. They were highly obnoxious to the Presbyterians of Scotland, not only on their own account, but as part of an attempt to change the whole constitution of the church; and because they were adopted wtihout free discussion in the assembly, and in mere compliance with the will of the king, who was also regarded as having unduly interfered with the constitution of the assembly itself. They were, however, ratified by the parliament on Aug. 4, 1621—a day long remembered in Scotland as "black Saturday"—were enforced by the court of high commission, and became one of the chief subjects of that contention between the king and the people, which produced results so grave and sad for both in the subsequent reign. The general assembly of Glasgow, in 1638, declared that of Perth to have been "unfree, unlawful, and null."

PERTH AMBOY, city and port of entry in Middlesex co., N. J.; on Raritan bay and the Lehigh valley, the Central of New Jersey, the Pennsylvania, and the Staten Island Rapid Transit railroads; 12 miles from New Brunswick, the co. seat. It contains a public library, Old Ministers' home (Presb.), high school, electric light plant, waterworks, state and savings banks, about 10 churches, and manufactories of terra cotta, fine brick, hollow brick, and emery. It is also engaged in shipbuilding, and has large coal-shipping interests. The city was settled in 1680 and named Perth after the earl of Perth, to which the Indian name Ambo was subsequently added. The last British governor of the colony, William Franklin, was captured here in 1776. It was incorporated as a city in 1784. Pop. '90, 9512.

PERTHES, Clemens Theodor, 1809–67, jurist and historian, second son of Friedrich Christoph Perthes (q. v.), was a professor of law at the university of Bonn and the author of a biography of his father (1848–55), treatises on German political history before the Revolution, and in the period of French domination, and *Das Herbergswesen der Handwerksgesellen* (1856).

PERTHES, Friedrich Christoph, an eminent German publisher, distinguished not only in his professional capacity, but for his sincere piety and ardent patriotism, was born at Rudolstadt, April 21, 1772. In his 15th year he was apprenticed to a Leipsic bookseller, with whom he remained six years, devoting much of his leisure time to the acquisition of knowledge. In 1793 he passed into the establishment of Hoffmann, the Hamburg bookseller; and in 1796 started business on his own account; and, by his keen and wide appreciation of the public wants, his untiring diligence, and his honorable reputation, he ultimately made it the most extensive of the kind in modern Germany. During the first few years or so of his Hamburg apprenticeship his more intimate friends had been either Kantian or skeptical in their opinions, and Perthes, who was not distinguished for either learning or speculative talent, had learned to think with his friends; but a friendship which he subsequently formed with F. H. Jacobi (q.v.), and the Holstein poet and humorist, Matthias Claudius, led him into a serious but liberal Christianity. The iron rule of the French in northern Germany, and the prohibition of intercourse with England, nearly ruined trade, yet Perthes, even in this great crisis of affairs, found ways and means to extend his. He endeavored to enlist the intellect of Germany on the side of patriotism, and in 1810 started the *National Museum*, with contributions from Jean Paul Richter, count Stolberg, Claudius, Fouquè, Heeren, Sartorius, Schlegel, Görres, Arndt, and other eminent men. Its success was far beyond Perthes's expectations, and encouraged him to continue his patriotic activity, till Hamburg was formally incorporated with the French empire. He subsequently took a prominent part in forcing the French garrison to evacuate Hamburg, Mar. 12, 1813; and on its reoccupation by the French, he was one of the *ten* Hamburgers who were specially excepted from pardon. After peace had been restored to Europe, Perthes steadily devoted himself to the extension of his

business, and to the consolidation of the sentiment of German national unity, as far as that could be accomplished by literature and speech. In 1822 he removed to Gotha, transferring his Hamburg business to his partner Besser. Here he laid himself out mainly for the publication of great historical and theological works. His subsequent correspondence with literary, political, and theological notabilities—such as Niebuhr (one of his dearest friends), Neander, Schleiermacher, Lücke, Nitszch, Tholuck, Schelling, and Umbreit—is extremely interesting, and throws a rich light upon the recent inner life of Germany. He died May 18, 1843.—See the biography (12th edit. 1853), by his second son, Clemens Theodor Perthes.—The uncle of Friedrich Christoph Perthes was Johann Geor. Justus Perthes, who established a publishing and bookselling house at Gotha in 1785, which has acquired, in the hands of his sons, a great reputation, and from which issues the famous *Almanach de Gotha*. He died in 1816.

PERTHSHIRE, one of the most important counties in Scotland, is bounded on the s. by the shires of Stirling and Clackmannan; on the n. by Inverness and Aberdeen; on the w. by Argyle and Dumbarton; and on the e. by Forfar, Fife, and Kinross. It extends from e. to w. about 70 m., and from n. to s. about 66 miles. Its area is 2,528 m., of which 57,000 acres were wooded. It is divided into the highland and lowland districts, the former occupying much the larger surface, and these are subdivided into ten divisions—viz., Menteith, Strathearn, Gowrie, Stormont, Strathardle, Glenshee, Athol, Breadalbane, Rannoch, and Balquidder. Perthshire, from its insular position and other advantages, has a comparatively mild climate; and the soil, in Strathearn, Carse of Gowrie, and other less extensive tracts, being mostly composed of a rich loam, crops of all kinds are brought to the utmost perfection. These districts are also famed for their fruit and floral productions. Perthshire is not less distinguished for its magnificent mountain, lake, and river scenery. The Grampians here attain to nearly their maximum height, Ben Lawers being within a few feet of 4,000 in altitude; while Ben More is 3,843; and several others above 3,000. The lakes are numerous, the principal of which are lochs Tay, Ericht, Rannoch, Katrine, Achray, Vennacher and Menteith. There are several streams of note, the principal being the Tay, which is fed by numerous other streams, and is said to discharge as much water into the sea as any other river in the kingdom. These lakes and streams afford excellent fishing, and the Tay is valuable for its salmon.

The monuments of antiquity to be found in this county afford an interesting field of investigation for the curious. Lying northward of the Roman wall, Perthshire comprises the scenes of the last struggle for independence which the inhabitants of the lowland districts of Scotland made against those formidable enemies of theirs, who were regarded as invincible. The last battle fought by the Caledonians against the Romans was at Mons Gramp, or rather, as it should be read, Graup, supposed to be indicated by the great camp at Ardoch, between Dunblane and Crieff, and which does not at all seem to be connected with the Grampian range. In this final struggle, the result of which was that the Lowlanders were defeated, Agricola commanded the conquering host, and the Caledonians were led by a chief named *Galgacus*.

The chief towns of Perthshire are Perth, Dunkeld, Auchterarder, Dunblane, and Abernethy. The county is divided into eastern and western parliamentary divisions, each sending one member to the house of commons. According to agricultural statistics taken in 1893, the number of acres under all kinds of crops was 337,000; under corn crops was 55,000; under green crops, 28,000, of which 9,000 were potatoes and 18,000 turnips; grasses—for hay 48,000, not for hay 43,000. Horses, 8,000; cattle, 48,000; sheep, 451,000; pigs, 4,000. The number of acres under cultivation occupied by tenants was in the same year 827,000, and by owners 173,000. On account of the local government act of 1889 the parishes of Culross and Tulliallan, forming a separate part of the county on the firth of Forth, were transferred to the county of Fife.

The old red sandstone, granite, and slate abound. There are volcanic traces in the Sidlaw and Ochil hills, and raised beaches in the firth of Tay prove recent upheaval. In this county are situated some of the stateliest mansions in Scotland, but, except Scone palace, none of them contain any historical memorials; and objects of antiquarian interest more recent than Roman roads and camps are the cathedrals of Dunblane and Dunkeld and the abbey of Culross. Pop. '91, 122,185.

PERTINAX, Publius Helvius, Roman emperor, was b., according to Dio Cassius, at Alba-Pompeia, a Roman colony of Liguria, 126 A.D. He received a good education, and, entering the military service, rose through the various grades till he obtained the command of the first legion, at the head of which he signalized himself in Rhætia and Noricum against the native tribes. In 179 he was chosen consul, aided to repress the revolt of Avitus in Syria, and was governor successively of the provinces of Mœsia, Dacia, and Syria. Being sent by the emperor Commodus to take the command of the turbulent legions in Britain, these troops, against his will, proclaimed him emperor; on which he solicited to be recalled, and was appointed proconsul of Africa, prefect of Rome, and consul (a second time) in 192. On the death of Commodus, his assassins almost forced Pertinax to accept of the purple, which with great hesitation he did; but in spite of his promise of a large donation, he was unable to gain over the prætorian

guard. His accession was, however, hailed with delight by the senate and people, who were rejoiced to have, as ruler, an able captain, instead of a ferocious debauchee; and Pertinax, encouraged by this favorable reception, announced his intention of carrying out an extensive series of reforms, having reference chiefly to the army, in which he hoped to re-establish the ancient Roman discipline. Unfortunately for his reforms and himself, he was attacked by a band of the rebellious prætorians, two months and 27 days after his accession; and disdaining to flee, was slain, and his head carried about the streets of Rome in triumph. From his history, nothing can be gathered respecting his character and talents (except in military affairs); but the respect and esteem in which he was held by the senate and people of Rome argue well in favor of his disposition.

PERTY, Joseph Anton Maximilian; b. in Bavaria, 1804; studied at Munich, and became in 1833 professor of zoölogy and natural history in the university of Bern, and finally rector. D. 1884. His principal works are *Allgemeine Naturgeschichte als philosphische und Humanitätswissenschaft; Die mystischen Erscheinungen der menschlichen Natur; Ueber das Seelenleben der Thier; Blicke in das verborgene Leben des Menschengeistes.*

PERTURBATIONS, in physical astronomy, are the disturbances produced in the simple elliptic motion of one heavily body about another, by the action of a third body, or by the non-sphericity of the principal body. Thus, for instance, were there no bodies in space except the earth and moon, the moon would describe accurately an ellipse about the earth's center as focus, and its radius-vector would pass over equal areas in equal times; but only if both bodies be homogeneous and truly spherical, or have their constituent matter otherwise so arranged that they may attract each other as if each were collected at some definite point of its mass. The oblateness of the earth's figure, therefore, produces pertubations in what would otherwise be the fixed elliptic orbit of the moon. Again, when we consider the sun's action, it is obvious that in no position of the moon can the sun act equally upon both earth and moon; for at new moon, the moon is nearer to the sun than the earth is, and is therefore more attracted (in proportion to its mass) than the earth—that is, the *difference* of the sun's actions on the earth and moon is equivalent to a force tending to draw the moon away from the earth. At full moon, on the other hand, the earth (in proportion to its mass) is more attracted than the moon is by the sun; and the perturbing influence of the sun is again of the nature of a force tending to separate the earth and moon. About the quarters, on the other hand, the sun's attraction (mass for mass) is nearly the same in amount on the earth and moon, but the *direction* of its action is not the same on the two bodies, and it is easy to see that in this case the pertubing force tends to bring the earth and moon nearer to each other. For any given position of the moon, with reference to the earth and sun, the *difference* of the accelerating effects of the sun on the earth and moon is a disturbing force; and it is to this that the pertubations of the moon's orbit, which are the most important, and among the most considerable, in the solar system, are due. [By the word *difference*, just employed, we are of course to understand, not the arithmetical difference, but the resultant of the sun's direct acceleration of the moon, combined with that on the earth reversed in direction and magnitude; as it is only with the *relative* motions of the earth and moon that we are concerned.] This disturbing force may be resolved into three components; for instance, we may have one in the line joining the earth and moon, another parallel to the pane of the ecliptic, and perpendicular to the moon's radius-vector, and a third perpendicular to the plane of the ecliptic. The first component, as we have already seen, tends to separate the earth and moon at new and full, and to bring them closer at the quarters; but during a whole revolution of the moon, the latter tendency is more than neutralized by the former; that is, in consequence of the sun's disturbing force, the moon is virtually less attracted by the earth than it would have been had the sun been absent. The second component mainly tends to accelerate the moon's motion in some parts of its orbit, and to retard it at others. The third component tends, on the whole, to draw the moon towards the plane of the ecliptic. We cannot, of course, enter here into even a complete sketch of the analysis of such a question as this; but we may give one or two very simple considerations which will, at all events, indicate the nature of the grand problem of perturbations.

The method, originally suggested by Newton, which is found on the whole to be the most satisfactory in these investigations, is what is called the *Variation of Parameters*, and admits of very simple explanation. The path which a disturbed body pursues is, of course, no longer an ellipse, nor is it in general either a plane curve or re-entrant. But *it may be considered to be an ellipse which is undergoing slow modifications in form, position, and dimensions, by the agency of the disturbing forces.* In fact, it is obvious that any small arc of the actual orbit is a portion of the elliptic orbit which the body would pursue forever afterwards, if the disturbing forces were suddenly to cease as it moved in that arc. The *parameters*, then, are the elements of the orbit; that is, its major axis, eccentricity, longtitude of apse, longitude of node, inclination to the ecliptic, and epoch; the latter quantity indicating the time at which the body passed through a particular point, as the apse, of its orbit. If these be given, the orbit is completely known, with the body's position in it at any given instant. If there be no disturbing forces, all these quantities are constant; and therefore, when the disturbing forces are taken into account, they change very slowly, as the disturbing forces are in most cases very small. To give an

instance of the nature of their changes, let us roughly consider one or two simple cases. First, to find the nature of some of the effects of a disturbing force acting in the radius-vector, and tending to draw the disturbed, from the central, body. Let S be the focus, P the nearer apse, of the undisturbed elliptic orbit. When the moving body passes the point M, the tendency of the disturbing force is to make it describe the dotted curve in the figure—i. e., the new direction of motion will make with the line MS an angle more nearly equal to a right angle than before; and therefore the apse Q in the disturbed orbit will be sooner arrived at than P would have been in the undisturbed orbit—that is, the apse *regredes*, or revolves in the contrary sense to that of M's motion. Similarly, the effect of M_1 is also to make the apse regrede to Q_1. At M_2 and M_3, on the other hand, the tendency is to make the apse progrede. Also, as the velocity is scarcely altered by such a force, the major axis remains unaltered. Thus at M the eccentricity is diminished, and at M_1 increased, since the apsidal distance is increased at M, and diminished at M_1.

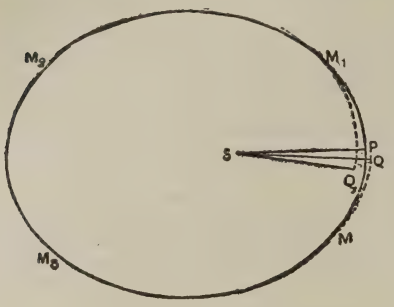

Fig. 1.

Next, consider a tangential accelerating force. Here the immediate effect is to increase the velocity at any point of the orbit, and therefore to make it correspond to a larger orbit, and, consequently, a longer periodic time. Conversely, a retarding force, such as the resistance of a medium, diminishes the velocity at each point, and thus makes the motion correspond to that in an ellipse with a less major axis, and therefore with a diminished periodic time. This singular result, that the periodic time of a body is *diminished* by resistance, is realized in the case of Encke's comet, and this observed effect furnishes one of the most convincing proofs of the existence of a resisting medium in interplanetary space.

Again, the effect of a disturbing force continually directed toward the plane of the ecliptic, is to make the node regrede. Thus, if N'N represent the ecliptic, NM a portion of the orbit, the tendency of the disturbing force at M is to make MQ the new orbit, and therefore N' the node. Thus the node regredes, and the inclination of the orbit to the ecliptic is diminished, when the planet has just passed the ascending node. In the second figure, let M_1 be a position of the planet near the descending node N_1. The effect of the disturbing force is to alter the orbit to MN_1'. Thus, again, the node regredes, but the inclination is increased. If NN' and N_1N_1' in these figures represent the earth's equator, the above rough sketch applies exactly to the case of the moon as disturbed by the oblateness of the earth. The reaction of the moon on the earth gives rise to the precession of the equinoxes (q.v.).

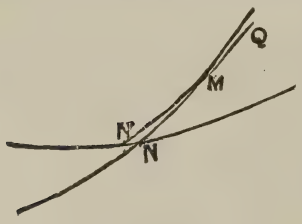

Fig. 2.

By processes of this nature, Newton subjected the variation of the elements of the moon's orbit to calculation, and obtained the complete explanation of some of the most important of the lunar inequalities. See Moon. Others of them—for instance, the rate of progression of the apse—cannot be deduced with any accuracy by these rough investigations, but tax, in some cases, the utmost resources of analysis. Newton's calculation of the rate of the moon's apse was only about half the observed value; and Clairaut was on the point of publishing a pamphlet, in which a new form was suggested for the law of gravitation, in order to account for the deficiency of this estimate; when he found, by carrying his analysis further, that the expression sought is obtainable in the form of a slowly converging series, of which the second term is nearly a large as the first. The error of the modern lunar tables, founded almost entirely on analysis, with the necessary introduction of a few data from observation, rarely amounts to a *second* of arc; and the moon's place is predicted four years beforehand, in the *Nautical Almanac*, with a degree of precision which no mere observer could attain even from one day to the next. This is the true proof, not only of the law of gravitation, but of the laws of motion (q.v.), upon which, of course, the analytical investigation is based.

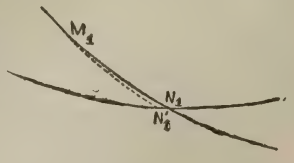

Fig. 3.

With respect to the mutual perturbations of the planets, we may merely mention that they are divisible into two classes, called *periodic* and *secular*. The former depend upon the configurations of the system—such, for instance, is the diminution of the inclination

of the moon's orbit, after passing the ascending node on the earth's equator, already mentioned, or its increase as the moon comes to the descending node. The secular perturbations depend upon the period in which a complete series of such alternations have been gone through, and have, in the case of the planets, complete cycles measured by hundreds of years.

A very curious kind of perturbation is seen in the *indirect* action of the planets on the moon. There is a secular change of the eccentricity of the earth's orbit, due to planetary action, and this brings the sun, on the average, nearer to the earth and moon for a long period of years, then for an equal period takes it further off. One of the effects of the sun's disturbing force being, as we have seen, to diminish, on the whole, the moon's gravity toward the earth, this diminution will vary in the same period as the eccentricity of the earth's orbit; and therefore the moon's mean motion will be alternately accelerated and retarded, each process occupying an immense period.

With special reference to the planetary motions, we may notice that the major axis of each planetary orbit is free from all secular variations; and those affecting the inclination and eccentricity are confined within small limits, and ultimately compensate themselves. These facts, which have been clearly and beautifully demonstrated by Laplace and Lagrange, assure the stability of the planetary orbits, if we neglect the effects of resistance due to the interplanetary matter; which, however, must, in the long run, bring all the bodies of the system into collision with the sun, and finally stop the rotation of the sun itself.

Newton commenced the investigation of perturbations by considering those of the moon; Euler followed with a calculation of Saturn's inequalities; while Clairaut, D'Alembert, and others successively gave those of the other planets.

Every one knows that it was by observing the perturbations of Uranus, and thence discovering the direction of the disturbing force, that Adams and Leverrier were led to their great and simultaneous discovery of the planet Neptune.

PERU', an important maritime republic of South America, bounded on the n. by Ecuador, on the e. by Brazil and Bolivia, on the s. and s.e. by Bolivia and on the w. by the Pacific ocean. Its coast inclines to the s.e. The extreme western point is Parina, long. 81° 20′ w. and the southernmost point of the coast is 71° 20′ w. P. is about 900 miles long and 500 miles in average width. The widest portion is in the extreme northern, and the narrowest in the southern extremity. The estimated area is 464,000 sq. miles. Census-taking is very irregular. There was a census in 1876 which showed a population of over 2,600,000, exclusive of aboriginal Indians, who numbered about 350,000. Later estimates place the population at 3,000,000. On the e. side of the Andes, and between the Amazon and the Purus, there is a wide and unexplored expanse of country, upon which both Peru and Brazil have claims, though the boundary is now generally regarded as marked by the Rio Javary. The country is 1000 m. in length, 780 m. in extreme breadth along the northern boundary, but is, little more than 50 m. wide in the extreme south. Following the general direction, and not including windings, the coast-line is 1600 m. in length. The shores are in general rocky and steep; in the s., lofty cliffs rise from the sea, and, in some places, the water close inshore has a depth of from 70 to 80 fathoms. Further n., however, sandy beaches occur, and in the extreme n., the shores are often low and sandy, covered with brushwood. Owing to the comparative unfrequence of bays and inlets along the coast, the harbors are few and unimportant. Those of Callao (the port of Lima) and Payta afford the most secure anchorage, and the others are Salaverry, Chimbote, Pisco, Mollendo, and Islay. Even there landing by boats is always dangerous, on account of the dreaded surf, occasioned by the swell of the Pacific, which perpetually beats upon the coast; and when goods or passengers require to be landed on unsheltered shores, recourse is had to the primitive *balsas*, or rafts, worked by the natives, and capable of carrying two or three persons.

Islands.—The islands on the Peruvian coast, although valuable, are extremely few in number, and small in extent. In the n., are the Lobos (i.e., *Seal*) islands, forming a group of three, and so called from the seals which frequent them. The largest of them, Lobos de Terra, is 5 m. long by 2 m. broad, and the others, lying 30 m. s.w., are much smaller. On their eastern sides, they are covered with guano, and the quantity on the whole group, when it began to be exported from them, was stated to be 4,000,000 tons. The islands of Macabi and Guañope, near the Lobos, were originally calculated to contain 2,280,000 tons of guano; but the guano exported has very greatly exceeded that amount, and in 1872, it was calculated that there were still 750,000 tons of guano on the former and 500,000 tons on the latter. The Chincha islands, three in number, and the most famous of the whole, which began to supply Europe in 1841, had very little guano left on them in 1873. They are called the North, Middle, and South islands respectively. Each presents, on the eastern side, a wall of precipitous rock, with a general slope towards the western shore. The cavities and inequalities of the surface used to be filled with guano, and this material covered the western slopes to within a few feet of the water's edge. There was no vegetation. The North island has an area of 202 acres. It is formed of felspar and quartz, and is slowly but certainly decreasing in size. This island used to be wholly covered with thick layers of guano, which was quarried in some places to a depth of 80 feet. Hundreds of convicts were employed in cutting the guano and loading the vessels. The Chincha islands ceased to be worked for foreign export in 1872, and now guano is only taken for Peruvian use from the northern island,

where there is still supposed to be 150,000 tons. In 1874, however, valuable new deposits of guano were discovered on the southern coast of Peru, which are estimated to contain about 80,000,000 tons.

The grand physical feature of the country, and the source of all its mineral wealth, is the great mountain system of the Andes. A general description of the formation and character of the Peruvian Andes is given under the article ANDES (q.v.).

Surface, Soil, and Climate.—The surface of Peru is divided into three distinct and well-defined tracts or belts, the climates of which are of every variety from torrid heat to arctic cold, and the productions of which range from the stunted herbage of the high mountain-slopes, to the oranges and citrons, the sugar-canes and cottons, of the luxuriant tropical valleys. These three regions are the *Coast*, the *Sierra*, and the *Montaña.*—The *Coast* is a narrow strip of sandy desert between the base of the western Cordillera and the sea, and extending along the whole length of the country. This tract, varying in breadth from 30 to 60 m., slopes to the shore with an uneven surface, marked by arid ridges from the Cordillera, and with a rapid descent. It is for the most part a barren waste of sand, traversed, however, by numerous valleys of astonishing fertility, most of which are watered by streams, that have their sources high on the slopes of the Cordillera. Many of the streams are dry during the greater part of the year. Between these valleys extend deserts, which are sometimes 90 m. in width. These are perfectly trackless, being covered with a fine, shifting, yellow sand, which is often carried about by the wind in pillars of from 80 to 100 ft. in height. In the coast-region, properly so called, rain is unknown. This is caused by the coast of Peru being within the region of perpetual s.e. trade-winds. These winds, charged with vapors from the Atlantic, strike upon the e. coast of South America, and traverse that continent obliquely, distributing rains over Brazil. But their vapor is thoroughly condensed by the lofty Cordilleras, and their last particles of moisture are exhausted in powdering the summits of these ranges with snow, after which they fall down upon the coast of Peru, cool and dry. The want of rain, however, is compensated for to some extent by abundant and refreshing dews, which fall during the night. The climate of the coast is modified by the cool winds. In the valleys, the heat, though considerable, is not oppressive. The highest temperature observed at Lima in summer is 85°, the lowest in winter is 61° F.

The *Sierra* embraces all the mountainous region between the western base of the maritime Cordillera and the eastern base of the Andes, or the eastern Cordillera. These ranges are, in this country, about 100 m. apart on an average, and have been estimated to cover an area of 200,000 sq.miles. Transverse branches connect the one range with the other, and high plateaux, fertile plains, and deep tropical valleys lie between the lofty outer barriers. The superiority in elevation alternates between the two principal ranges. The e. range, or, as it is generally called, the Andes, has the superiority in height in the southern half of this mountain system. It abuts upon the plain, from the Bolivian frontier, in a majestic mass, surmounted by stupendous pinnacles, rugged in outline, and most frequently rising in splintered needle-like peaks, covered with snow. North of lat. 13° s., however, the western Cordillera assumes the grander character, and preserves it until it crosses the northern frontier. The scenery of the western Cordillera is broader and more massive in character, and its summits less pointed than those of the Andes. Rugged paths, sometimes so narrow as barely to afford footing to the mules which are invariably used in such ascents, lead up its steep sides. Occasionally, from these narrow passes, gaping and apparently bottomless precipices slide perpendicularly downward from the very feet of the traveler, and the prospect is rendered still more hideous by the distant roar of a torrent, hidden by mists, at the bottom of the ravine. Occasionally, also, the mountain route leads over abysses 500 ft. in depth, across which, by way of bridge, a few poles are thrown, which roll about in an uncomfortable manner under the feet. In traversing these dangerous passes, which line the huge rocks like aërial threads, the traveler often comes upon scenery of the most picturesque and beautiful description. The clefts and sides of the hills, even at altitudes which might be called alpine, are clothed with wild-flowers, many of which, long cultivated in the U. S., have become highly prized among us as garden-plants. Verbenas, lupines, blue and scarlet salvias, fuchsias, calceolarias, and the fragrant heliotrope, add a sense of beauty to the sense of power which the stupendous scenery imparts. The following are the most striking and distinctive physical features of the Sierra, beginning from the south: 1. The plain of Titicaca, partly in Peru, and partly in Bolivia, is enclosed between the two main ridges of the Andes, and is said to have an area of 30,000 m.—greater than that of Ireland. In its center is the great lake Titicaca, 12,846 ft. above sea-level, or 1600 ft. above the loftiest mountain pass (the col of Mont Cervin) of Europe. The lake is 115 m. long, from 30 to 60 m. broad, from 70 to 180 ft. deep, and 400 m. in circumference. Its shape is irregular; it contains many islands, and several peninsulas abut upon its waters. 2. The knot of Cuzco. The mountain-chains which girdle the plain of Titicaca trend toward the n.w., and form what is called the knot of Cuzco. The knot comprises 6 minor mountain-chains, and has an area thrice larger than that of Switzerland. Here the valleys enjoy an Indian climate, and are rich in tropical productions; to the n. and e. of the Knot extend luxuriant tropical forests, while the numberless mountain-slopes are covered with waving crops of wheat, barley, and other cereals, and with potatoes; and higher up, extend pasture-lands, where the vicuña and

alpaca feed. 3. The valley of the Apurimac, 30 m. in average breadth, and extending n.w. for about 300 miles. This valley is the most populous region of Peru. 4. The Knot of Pasco. From Cuzco proceed two chains toward the n.w.; they unite again in the Knot of Pasco. This Knot contains the table-land of Bombon, 12,300 ft. above sea-level; as well as other table-lands at a height of 14,000 ft., the highest in the Andes; otherwise, however, the physical features of the country resemble those of the vicinity of Cuzco. 5. The vale of the river Marañon. This valley, which is upward of 300 m. in length, is narrow, deep, and nearer the equator than any other valley of the Sierra, and consequently, it is the hottest portion of this region; and its vegetation is thoroughly tropical in character. The conformation of the surface of the Sierra is of the most wonderful description. After the table-lands of Tibet, those of the Peruvian Andes are the highest in the world; but, unlike those of Tibet, which are mere grassy uplands, the table-lands of Peru are the seat of a comparatively high civilization, and are studded over with towns and villages, perched on heights exceeding in elevation the summits of the Jungfrau and the Wetterhorn. Nor are such towns the mere eyries of miners who are tempted to ascend thus high in search of the precious metals; for, even at this elevation, the climate is pleasant, and wheat, maize, barley, rye, and potatoes thrive well. The city of Cuzco, situated in a region of rare beauty, and enjoying a temperate climate, is 11,380 ft. above sea-level, or 2,000 ft. higher than the great St. Bernard. The climate of the Sierra, however, is not always so charming. In general terms, it may be described as mild and variable, with moderate rains. In the district of Paucartambo, rain falls 300 days in the year. A country, however, of such an uneven surface, of snow-covered peaks and tropical valleys, embraces every variety of climate. In all the lower regions of the country the climate is warm, but healthy; in the uplands, and on the highest plateaux, it is often inclement. Violent storms beat upon the plain of Titicaca; and terrific temptests, accompanied with thunder and lightening, roll frequently around the table-lands of Pasco (q.v.); where, indeed, the climate is so cold, that but for the mines, which have attracted hither a numerous population, this region might have remained uninhabited. At the height of 9,000 ft. above sea-level, the mean temperature is 60° Fahr., and the variation throughout the year is not great. The highest peaks of the country reach to upward of 22,000 ft., and many peaks in both ranges are from 17,000 to 20,000 ft. high. In the western Cordillera, and in the s. of the country, are 4 volcanoes—Candarave, Ubinas, Omate, and Arequipa. The soil of the Sierra is of great variety; but wherever it is cultivated, it is productive.

The *Montaña*, forming two-thirds of the entire area of the country, stretches away for hundreds of leagues eastward from the Andes to the confines of Brazil. On the n., it is bounded by the Amazon, on the s. by Bolivia. It consists of vast impenetrable forests and alluvial plains, is rich in all the productions of tropical latitudes, is of inexhaustible fertility, and teems with animal and vegetable life. It is still, however, almost wholly unproductive to man. The silence of its central forests has never been disturbed by the civilized explorer, and its only human inhabitants are a few scattered tribes of Indians. The Montaña is watered by numberless streams, and by a large number of important rivers. It belongs wholly to the basin of the Amazon. Along the head-waters of the Purus, which, flowing through beautiful forest-covered plains, approaches to within 60 m. of Cuzco, there were at one time numerous Spanish farms, where great tracts of forests had been cleared, and where crops of coco, cocoa, sugar, and other tropical productions were regularly raised. These farms have since 1861 been abandoned, and the encroaching forest has already obliterated their sites. The upper waters of the Purus are the head-quarters of a savage and barbarously cruel tribe of wild Indians called Chunchos. These untamable savages have shown the greatest hostility to the advance of civilization. They murdered the settlers, or drove them to take refuge in some less advanced settlement. When Mr. Markham visited this region in 1853, a few farms still existed; from a paper, however, which he communicated to the *Journal of the Royal Geographical Society*, and which is dated 1861, it would appear that the Chunchos had finished their barbarous work, for the settlers had either all been massacred or driven back from the forest, so that now not a single settlement remains. The rich valleys of Paucartambo, once covered with flourishing Spanish farms, have again become one vast tropical forest. The virgin soil of the Montaña is of amazing fertility; while its climate, though not oppressively hot, is healthy. The forests consist of huge trees, of which some are remarkable for the beauty of their wood, others for their valuable gums and resins, and others as timber trees. A rank undergrowth of vegetation covers the country, and the trees are often chained together and festooned with parasites and closely-matted creepers. In this region, for the most part undisturbed by the voice of man, civilized or savage, animal life flourishes in endless variety, and birds of the brighest plumage flit among the foliage. Among the products which are yielded here in spontaneous abundance, are the inestimable Peruvian bark (see CINCHONA), India-rubber, gum-copal, vanilla, indigo, copaiba, balsam, cinnamon, sarsaparilla, ipecacuanha, vegetable wax, etc. On the western fringe of the Montaña, where there are still a few settlements, tobacco, sugar, coffee, cotton, and chocolate, are cultivated with complete success.

Hydrography.—The hydrography of Peru may be said to be divided into three systems—those of lake Titicaca, the Pacific, and the Amazon. The streams that flow into lake Titicaca are few and inconsiderable. The rivers which, having their sources in the western Cordillera, flow w. into the Pacific, are about 60 in number; but many of them are dry in summer, and even the more important are rapid and shallow, have a short

course, are not navigable even for canoes, and are mainly used for the purpose of irrigation. All the great rivers of Peru are tributaries of the Amazon. The Marañon, rising between the eastern and western Cordilleras, and flowing tortuously to the n.n.w., is generally considered to be the head-water of the Amazon (q.v.). The Huallaga rises near the town of Huanuco, and flows northward to the Amazon. It is navigable for 600 m., the head of its navigation (for canoes) being at Tingo Maria, within 100 m. of its source. The Yucayali, or Ucayali, an immense river, enters the Amazon 210 m. below the Huallaga. Its tributaries and upper waters, among which are the Pampas and the Apurimac, drain the greater portion of the Peruvian Sierra. The Purus, which reaches to the valleys of Paucartambo, within 60 m. of Cuzco, has recently been explored. We know several of its sources, and that it enters the Amazon by four mouths, a little above Barra. It flows through what is perhaps the richest and most beautiful region of Peru. Many attempts have been made to explore this river, but none were successful till Mr. Chandless (1865–66) explored it and its tributary, the Aguirey. Sailing down the Rio Negro, from Manoas to the Amazon, he reached the mouth of the Purus, and ascended it a distance of 1866 miles. He found that it flowed in a tortuous course through a rich alluvial plain, and that the few Indians on its upper course were still as primitive as is indicated by the use of only stone hatchets. He ascertained that the Rio Madre de Dios is not the head-water of the Purus. He then ascended the Aguirey, the principal affluent of the Purus, in the hope that it might afford communication with that south Peruvian river, but failed, owing to difficulties insuperable by him, to settle the question.

Productions, Exports, Imports, Revenue, etc.—The wealth and resources of Peru consist, not in manufactures, but entirely in mineral, vegetable, and animal products. The chief products are sugar, cotton, and coffee, of which sugar is the most important. The planting of sugar-cane was introduced from Mexico and the industry soon became extensive. The increasing demand for sugar led to the introduction of slave labor, which began in 1529. At the close of the 18th century there were over 40,000 slaves employed in Peru, but in 1817 the importation was prohibited by the Spanish king. About the middle of the 19th century efforts to encourage immigration were made; and at the same time a large number of coolies were imported from China. This improvement in the labor market led to the rapid extension of the sugar industry and, when followed by the introduction of improved machinery, the exportation greatly increased. For several years after the peace with Chile in 1883, the sugar production declined and the scarcity of labor proved a serious hindrance. In recent years, however, the industry has regained its lost footing, partly through the introduction of better methods of production, and partly through the consolidation of companies leading through the concentration of capital to greater economy in the management. The cultivation of the cane is carried on along the entire coast, between the 3d and 18th degree of latitude. Among the chief departments for sugar production are Lambayeque, Lima, La Libertad, Piura, Ancachs, Ica, Arequipa and Tacna. The chief coffee-growing region is in central Peru. The exports of coffee are valued at 400,000 sols. Considerable attention is devoted to the raising of cocoa, rice, tobacco, and maize. Wines and spirits are manufactured and there is a considerable trade in india-rubber, cinchona, dyes, alpaca, vicuña, and medicinal plants; and there are rich deposits of guano on various islands along the coast. The mineral wealth of Peru is considerable and includes gold, silver, copper, lead, coal, tin, zinc, quicksilver, petroleum, salt, sulphur, and other minerals. Gold is found in many parts of the country, but there has been a lack of enterprise in the working of the mines. In 1895 six of the 19 departments were said to have deposits of gold, and in 1896 there were reports of gold discoveries in the provinces of Sandia and Carabaya. There were in 1894 upwards of 4,100 mines in Peru, and of these 427 were gold mines or washings, and 46 were for gold and silver together. The great majority of the mines, namely 2641, were for silver. There are extensive supplies of petroleum, especially in the province of Paita.

The chief exports of Peru are sugar, cotton, silver and silver ore, and wool. The leading nations with which she trades are Great Britain, Germany, the United States, and the South American republics. For the year ending June 30, 1896, the exports from Peru to the United States amounted to $886,476, and the leading items on the list were skins, cotton, coca leaves, and silver. There are no special taxes on foreigners, who enjoy the same privileges in respect to trade as the natives. The revenue is derived mainly from customs, but there is a direct tax on the rent from real property, and a considerable revenue is derived from the salt monopoly and from railways and telegraphs. The foreign debt of Peru consists of two loans which were obtained from England in 1870 and 1872. They amounted to £31,579,080. They were secured on the guano deposits and the general resources of the country, but the guano deposits became the possession of Chile and no interest was paid on the loans for many years. For a considerable period before the war with Chile, Peru had an inconvertible paper currency, but after that the paper became so far depreciated that only hard money was in circulation. The monetary unit is the sol, which is worth about fifty cents in United States currency. The constitution makes the public exercise of any other religion than the Roman Catholic unlawful, but as a matter of fact, churches of other denominations are tolerated to some extent. Still the number of Protestants, Jews, and those of other religions than the Roman Catholic, is comparatively insignificant. Lima contains the university of San Marcos, the oldest on the American continent, with faculties of political science, law, medicine, theology and applied sciences. Secondary education is controlled

by the government, which maintains high schools in the capitals of the departments. There are schools for special and technical training, and two minor universities at Arequipa and Cuzco. Primary instruction is compulsory. The military and naval forces of the republic are not large, the former consisting in 1896, of about 2875 men, and the latter comprising a single cruiser, one training ship, and some vessels which cannot be classified.

Ancient Civilization and History.—Peru, the origin of whose name is unknown, is now passing through its third historical era, and is manifesting its third phase of civilization. The present era may be said to date from the conquest of the country by the Spaniards in the early part of the 16th c.; the middle era embraces the rule of the Incas; and the earliest era, about which exceedingly little is known, is that pre-Incarial period, of unknown duration, during which a nation or nations living in large cities flourished in the country, and had a civilization, a language, and a religion different, and perhaps in some cases even more advanced than those of the incas who succeeded them, and overran their territories. Whence these pre-incarial nations came, and to what branch of the human family they belonged, still remain unanswered questions. Their existence, however, is clearly attested by the architectural remains, sculptures, carvings, etc., which they have left behind them. Ruins of edifices constructed both before the advent of the incas, and contemporary with, and independently of them, are found everywhere throughout the country. On the shores of lake Titicaca, for example, are the ruins of Tia-Huanacu, consisting of sculptured monolithic doorways, one of which is 10 ft. high, and 13 ft. wide; of pillars, 21 ft. high, placed in lines at regular distances; and of immense masses of hewn stone, some 30 ft. long by 18 broad. In 1846, several colossal idols were excavated, some being 18 ft. long, 18 wide, and 6 thick. The idols are in the form of statues, and the ears are not enlarged by the insertion in the lobes of silver rings, as those of sculptured figures, executed in incarial times invariably are. The ancient fragments of buildings on these shores were beheld with astonishment by the earliest of the incas, who, by their own confession, accepted them as models for their own architecture. The name Tia-Huanacu is comparatively modern, having been conferred by one of the incas; neither history nor tradition has handed down the original name. The ruins stand at a height of 12,930 ft. above sea-level, and one of the many mysteries which have crowded around this ancient site is, that this spot, in the midst of what is now generally a frozen desert, and where the rarity of the air must be so great as to be hurtful, should have been chosen as the seat, as it is generally believed to have been, of an ancient government. Of the character and degree of the civilization of the pre-incarial races, almost nothing is known. It is worthy of note, however, that at Pachacamac, 25 m. s. of Lima, where there are the remains of a now wholly deserted city, and of a great temple, the religion seems to have been a pure Theism; for when the Peruvians of Cuzco carried their victorious arms across the Cordilleras to this district, they beheld this temple (the doors of which are said to have been of gold inlaid with precious stones) with astonishment, not only because it rivaled if not surpassed in splendor the famous temple of the sun at Cuzco, but because it contained no image or visible symbol of a god. It was raised in honor of an invisible and mysterious deity, whom the inhabitants called Pachacamac, the creator of the world (from two words of the ancient Peruvian language, *pacha*, the earth; and *camac*, participle of the verb *camani*, to create). The Peruvians did not dare to destroy this temple, but contented themselves with buildlng by its side a temple of the sun, to the worship of which they gradually won over the inhabitants. For further information regarding Pre-Incarial times and races, see W. Bollaert's *Antiquities, Ethnology, etc., of South America* (Lond. 1860); Markham's *Peru* (1881).

Regarding the origin of the incas, nothing definite can be said. We have no authorities on the subject save the traditions of the Indians, and these, besides being outrageously fabulous in character, are also conflicting. It appears, however, from all the traditions, that Manco, the first inca, first appeared on the shores of lake Titicaca, with his wife Mama Oello. He announced that he and his wife were children of the sun, and were sent by the glorious Inti (the sun) to instruct the simple tribes. He is said to have carried with him a golden wedge, or, as it is sometimes called, a wand. Wherever this wedge, on being struck upon the ground, should sink into the earth, and disappear forever, there it was decreed Manco should build his capital. Marching northward, he came to the plain of Cuzco, where the wedge disappeared. Here he founded the city of Cuzco, became the first inca (a name said to be derived from the Peruvian word for the sun), and founded the Peruvian race, properly so-called. Manco, or Manco Capac (i. e., Manco the ruler), instructed the men in agriculture and the arts, gave them a comparatively pure religion, and a social and national organization; while his wife, Mama Oello, who is also represented as being his sister, taught the women to sew, to spin, and to weave. Thus, the inca was not only ruler of his people, but also the father and the high-priest. The territory held by Manco Capac was small, extending about 90 m. from e. to w., and about 80 m. from n. to south. After introducing laws among his people, and bringing them into regularly organized communities, "he ascended to his father, the sun." The year generally assigned as that of his death, after a reign of 40 years, is 1062 A.D. The progress of the Peruvians was at first so slow as to be almost imperceptible. Gradually, however, by their wise and temperate policy, they won over the neighboring tribes, who readily appreciated the benefits of a powerful and fostering government. Little is clearly ascertained regarding the early history of the Peruvian kingdom, and the lists given of its early sovereigns are by no means to be trusted. They invented no alphabet,

and therefore could keep no written record of their affairs, so that almost all we can know of their early history is derived from the traditions of the people, collected by the early Spaniards. Memoranda were indeed kept by the Peruvians, and, it is said, even full historical records, by means of the *quipu*, a twisted woolen cord, upon which other smaller cords of different colors were tied. Of these cross threads, the color, the length, the number of knots upon them, and the distance of one from another, all had their significance; but after the invasion of the Spaniards, when the whole Peruvian system of government and civilization underwent dislocation, the art of reading the quipus seems either to have been lost, or was effectually concealed. Thus it is that we have no exact knowledge of Peruvian history further back than about one century before the coming of the Spaniards. In 1453 Tupac Inca Yupanqui, the 11th inca, according to the list given by Garcilasso de la Vega, greatly enlarged his already wide-spread dominions. He led his armies southward, crossed into Chili, marched over the terrible desert of Atacama, and penetrating as far s. as the river Maule (lat. 36° s.), fixed there the southern boundary of Peru. Returning, he crossed the Chilian Andes by a pass of unequaled danger and difficulty, and at length regained his capital, which he entered in triumph. While thus engaged, his son, the young Huayna Capac, heir to the fame as well as the throne of his father, had marched northward to the Amazon, crossed that barrier, and conquered the kingdom of Quito. In 1475 Huayna Capac ascended the throne, and under him the empire of the incas attained to its greatest extent, and the height of its glory. His sway extended from the equatorial valleys of the Amazon to the temperate plains of Chili, and from the sandy shores of the Pacific to the marshy sources of the Paraguay. Of this immense territory, Cuzco, as its name implies (the word signifies naval), was the great center; great roads branched off from it to the n., s., e., and w., and ramified through every part of the kingdom. The greatest highway of the country was that which led from Quito through Cuzco into the Chilian dominions. In its construction, galleries were cut for leagues through the living rock; rivers were crossed by bridges of plaited osiers, that swung in the air; precipices were ascended by staircases artificially cut; and valleys were filled up with solid masonry. It was from 1500 to 2,000 m. long, was about 20 ft. broad, and was built of heavy flags of freestone. Upon all the great routes were posts or small buildings, about 5 m. apart, attached to which were a number of runners, whose business it was to carry forward the dispatches of government. By means of these messengers, fresh fish caught on one day at Lurin, on the Pacific, is said to have been eaten the next day at Cuzco. The distance between these places is 300 m., and the road traverses the wildest and most mountainous country in the world. Order and civilization accompanied conquest among the Peruvians, and each tribe that was vanquished found itself under a careful paternal government, which provided for it, and fostered it in every way.

The government of Peru was a pure but a mild despotism. The inca, as the representative of the sun, was the head of the priesthood, and presided at the great religious festivals. He imposed taxes, made laws, and was the source of all dignity and power. He wore a peculiar head-dress, of which the tasseled-fringe, with two feathers placed upright in it, were the proper insignia of royalty. Of the nobility, all those descended by the male line from the founder of the monarchy, shared, in common with the ruling monarch, the sacred name of inca. They wore a peculiar dress, enjoyed special privileges, and lived at court; but none of them could enter the presence of the inca except with bare feet, and bearing a burden on the shoulders, in token of allegiance and homage. They formed, however, the real strength of the empire, and, being superior to the other races in intellectual power, they were the fountain whence flowed that civilization and social organization which gave Peru a position above every other state of South America. Prior to the arrival of the Spaniards, Peru contained a pop. of 30,000,000—twelve times greater than it is at the present day. The empire was divided into four parts, into each of which one of the great roads branched from Cuzco. Each of the four provinces was administered by a viceroy or governor. The nation was further subdivided into departments of 10,000 inhabitants, each also administered by a governor; and there were other subdivisions into various numbers, the lowest of which was 10, and every one of which was ruled by head-men, who were responsible for offenders, and were required to see that those under them enjoyed the rights to which they were entitled. The governors and chief rulers were selected from the inca aristocracy. The laws related almost wholly to criminal matters, and were few, and remarkably severe. Theft, adultery, murder, blasphemy against the sun, and burning of bridges, were all capital crimes. The territory of the empire was divided into three portions, and from these portions were derived the revenue that supported the *sun*, the *inca*, and the *people* respectively. The numerous priesthood, and the costly ceremonial of the national worship, were supported by the first; the royal household and the government expenditure were defrayed out of the second; and the people, at so much per head, divided the third of these portions. There was a new division of the soil every year, and the extent of land apportioned to each householder was regulated by the numbers in his family. It might be supposed that this arrangement would be fatal to improvement of the soil, and to the pride in and love of home; but this was not the case; and it is probable that at each partition of the soil, the tenant was, as a rule, confirmed in his occupation. The three divisions were cultivated by the people, the territory apportioned to the sun being attended to first, that belonging to the people themselves next, and lastly, the division belonging to the inca. The labor on the inca's share of the land was engaged in by the whole population at the same time, and the work was lightened by the national songs

and ballads, and the scene made picturesque by the holiday attire of the workers. The manufactures of the country were managed in the same way, the people laboring first in making clothes for themselves, and afterwards giving their work to the inca. The mines were worked by the people, but no one gave more than a certain amount of time to the government service (during which time he was maintained at the government expense) and after discharging the stipulated amount of duty he was succeeded by another. Money was unknown among the Peruvians. They were a nation of workers, but they wrought as the members of one family, labor being enforced on all for the benefit of all.

The national policy of the Peruvians had its imperfections and drawbacks, and though capable of unlimited extension, it was not capable of advancement. It was in the last degree conservative, and was of such a nature that the introduction of reform in any vital particular must have overturned the whole constitution. Nevertheless, the wants of the people were few, and these were satisfied. Their labor was not more than they could easily perform, and it was pleasantly diversified with frequent holidays and festivals. They lived contentedly and securely under a government strong enough to protect them; and a sufficiency of the necessaries of life was obtained by every individual. Still, in the valleys of the Cordilleras and on the plain of Cuzco, may be heard numberless songs, in which the Peruvian mourns the happy days of peace, security, and comfort enjoyed by his ancestors. Further, they revered and loved their monarch, and considered it a pleasure to serve him. With subjects of such a temper and inclination, the incas might direct the entire energies of the nation as they chose; and it is thus that they were able to construct those gigantic public works which would have been wonderful even had they been performed with the assistance of European machinery and appliances.

The Peruvian system of agriculture was brought to its highest perfection only by the prodigious labor of several centuries. Not only was the fertile soil cultivated with the utmost care, but the sandy wastes of the coast, unvisited by any rains, and but scantily watered by brooks, were rendered productive by means of an artificial system of irrigation, the most stupendous, perhaps, that the world has ever seen. Water was collected in lakes among the mountains, led down the slopes and through the sands of the coast, apparently doomed to sterility, by canals and subterranean passages constructed on a vast scale, and the ruins of which, to be seen at the present day, attest the industry, ingenuity, and admirable patience of the Peruvians. The aqueducts, which were sometimes between 400 and 500 m. in length, were in some cases tunneled through massive rocks, and carried across rivers and marshes. They were constructed of large slabs of freestone, fitting so closely as to require no cement, and answering perfectly the purpose for which they were intended, for the sandy wastes were converted into productive fields and rich pasture-lands, and the coast teemed with industrious inhabitants. In the valley of Santa, there were once 700,000 inhabitants; there are now only 12,000: in that of Ancullama, there were 30,000 individuals; there are now only 425. The fields on the coast were also enriched with the manure of sea-fowls, which has since come to be known as guano. Fragments of the aqueducts still remain, and are surveyed with astonishment by the traveler, who wonders that such works could have been constructed by a people who appear to have employed no machinery, had no beasts of burden, who did not know the secret of the true arch, and who did not use tools or instruments of iron. But the triumphs of industry were not more decided on the coast than they were in the *Sierra*. Here, at elevations visited now only by the eagle and the condor, the rocky heights, riven by innumerable chasms and deeply-cut precipices, were crowned with waving crops of wheat and maize. Where the mountain-slopes were too steep to admit of cultivation, terraces were cut, soil was accumulated on them, and the level surfaces converted into a species of hanging-gardens. Large flocks of llamas were grazed on the plateaux; while the more hardy vicuñas and alpacas roamed the upper heights in freedom, to be driven together, however, at stated periods, to be shorn or killed. The wool yielded by these animals, and the cotton grown in the plains and valleys, were woven into fabrics equally remarkable for fineness of texture and brilliancy of color.

The character of the architecture of the Peruvians has already been alluded to. The edifices of incarial times are oblong in shape and cyclopean in construction. The materials used were granite, porphyry, and other varieties of stone; but in the more rainless regions, sun-dried bricks were also much used. The walls were most frequently built of stones of irregular size, but cut with such accuracy, and fitting into each other so closely at the sides, that neither knife nor needle can be inserted in the seams. Though the buildings were not, as a rule, more than from 12 to 14 ft. high, they were characterized by simplicity, symmetry, and solidity. The Peruvian architects did not indulge much in external decoration; but the interior of all the great edifices was extremely rich in ornament. In the royal palaces and temples, the most ordinary utensils were of silver and gold; the walls were thickly studded with plates and bosses of the same metals; and exquisite imitations of human and other figures, and also of plants, fashioned with perfect accuracy in gold and silver, were always seen in the houses of the great. Hidden among the metallic foliage, or creeping among the roots, were many brilliantly colored birds, serpents, lizards, etc., made chiefly of precious stones; while in the gardens, interspersed among the natural plants and flowers, were imitations of them in gold and silver, of such truth and beauty as to rival nature. The temple of the sun at Cuzco, called *Corieancha*, or "Place of Gold," was the most magnificent edifice in the empire. On the

western wall, and opposite the eastern portal, was a splendid representation of the sun, the god of the nation. In consisted of a human face in gold, with innumerable golden rays emanating from it in every direction; and when the early beams of the morning sun fell upon this brilliant golden disk, they were reflected from it as from a mirror, and again reflected throughout the whole temple by the numberless plates, cornices, bands, and images of gold, until the temple seemed to glow with a sunshine more intense than that of nature.

The religion of the Peruvians, in the later ages of the empire, was far in advance of that of most barbarous nations. They believed in a Great Spirit, the Creator of the universe, who, being a spirit, could not be represented by any image or symbol, nor be made to dwell in a temple made with hands. They also believed in the existence of the soul hereafter, and in the resurrection of the body. The after-life they considered to be a condition of ease and tranquillity for the good, and of continual wearisome labor, extending over ages, for the wicked. But while they believed in the Creator of the world, they also believed in other deities, who were of some subordinate rank to the Great Spirit. Of these secondary gods, the sun was the chief. They reverenced the sun as the source of their royal dynasty; and everywhere throughout the land, altars smoked with offerings burned in his worship.

About the year 1516, and 10 years before the death of Huayna Capac, the first white man had landed on the western shores of South America; but it was not till the year 1532 that Pizarro (q.v.), at the head of a small band of Spanish adventurers, actually invaded Peru. On his death-bed the great inca expressed a wish that the kingdom of Quito should pass to Atahualpa, one of his sons by a princess of Quito whom he had received among his concubines, and that all his other territories should fall to his son Huascar, the heir to the crown, and who, according to the custom of the incas, should have inherited all its dependencies. Between these two princes, quarrels, resulting in war, arose; and when Pizarro entered Peru he found the country occupied by two rival factions, a circumstance of which he took full advantage. Atahualpa had completely defeated the forces of his brother, had taken Huascar prisoner, and was now stationed at Caxamalca, on the eastern side of the Andes, whither, with a force of 177 men, of whom 27 were cavalry, the dauntless Spanish leader, in Sept., 1532, set out to meet him. For the capture of Atahualpa by the Spaniards, his subsequent life and violent death, see article ATAHUALPA. Shortly after the execution of the inca at Caxamalca, the adventurers set out for Cuzco. Their strength had been recently increased by re-enforcements, and they now numbered nearly 500 men, of whom about a third were cavalry. They entered the Peruvian capital, Nov. 15, 1533, having in the course of their progress toward the city of the incas, had many sharp, and sometimes serious encounters with the Indians, in all of which, however, their armor, artillery, and cavalry gave them the advantage. At Cuzco they obtained a vast amount of gold, the one object for which the conquest of Peru was undertaken. As at Caxamalca, the articles of gold were for the most part melted down into ingots, and divided among the band. Their sudden wealth, however, did many of them little good, as it afforded them the means of gambling, and many of them, rich at night, found themselves again penniless adventurers in the morning. One cavalier having obtained the splendid golden image of the sun as his share of the booty, lost it in play in a single night. After stripping the palaces and temples of their treasures, Pizarro placed Manco, a son of the great Huayana Capac, on the throne of the incas. Leaving a garrison in the capital, he then marched w. to the sea-coast, with the intention of building a town, from which he could the more easily repel invasion from without, and which should be the future capital of the kingdom. Choosing the banks of the river Rimac, he founded, about 6 m. from its mouth, the *Ciudad de los Reyes*, "City of the Kings." Subsequently its name was changed to Lima, the modified form of the name of the river on which it was placed. But the progress of a higher civilization thus begun, was interrupted by an event which overturned the plans of the general, and entailed the severest sufferings on many of his followers. The inca Manco, insulted on every hand, and in the most contemptuous manner, by the proud Castilian soldiers, effected his escape, and headed a formidable rising of the natives. Gathering round Cuzco in immense numbers, the natives laid siege to the city, and set it on fire. An Indian force also invested Xauxa, and another detachment threatened Lima. The siege of Cuzco was maintained for 5 months, after which time the Peruvians were commanded by their inca to retire to their farms, and cultivate the soil, that the country might be saved from famine. The advantages, many, though unimportant, which the inca gained in the course of this siege, were his last triumphs. He afterwards retired to the mountains, where he was massacred by a party of Spaniards. More formidable, however, to Pizarro than any rising of the natives, was the quarrel between himself and Almagro, a soldier of generous disposition, but of fiery temper, who, after Pizarro, held the highest rank among the conquerors. For the insurrection, trial, and execution of this chief, see article ALMAGRO. The condition of the country was now in every sense deplorable. The natives, astonished not more by the appearance of cavalry than by the flash, the sound, and the deadly execution of artillery, had succumbed to forces which they had no means of successfully encountering. Meantime the Almagro faction had not died out with the death of its leader, and they still cherished schemes of vengeance against the Pizarros. It was resolved to assassinate the general as he returned from mass on Sunday, June 26, 1541. Hearing of the conspiracy, but attaching little importance to the information, Pizarro nevertheless deemed it prudent not to go to mass that day.

His house was assaulted by the conspiritors, who, murdering his servants, broke in upon the great leader, overwhelmed him by numbers, and killed him (see PIZARRO). The son of Amalgro then proclaimed himself governor, but was soon defeated in battle, and put to death. In 1542 a council was called at Valladolid, at the instigation of the ecclesiastic Las Casas, who felt shocked and humiliated at the excesses committed on the natives. The result of this council was that a code of laws was framed for Peru, according to one clause of which, the Indians who had been enslaved by the Spaniards were virtually declared free men. It was also enacted that the Indians were not to be forced to labor in unhealthy localities, and that in whatever cases they were desired to work in any particular locality, they were to be fairly paid. These and similar clauses enraged the adventurers. Blasco Nuñez Vela, sent from Spain to enforce the new laws, rendered himself unpopular, and was seized, and thrown into prison. He had come from Spain accompanied by an "audience" of four, who now undertook the government. Gonzalo Pizarro (the last in this country of the family of that name), who had been elected captain-gen. of Peru, now marched threateningly upon Lima. He was too powerful to withstand, and the audience received him in a friendly manner, and after the administration of oaths, elected him governor as well as captain-gen. of the country. The career of this adventurer was cut short by Pedro de la Gasca, who, invested with the powers of the sovereign, arrived from Spain, collected a large army, and pursued Pizarro, who was eventually taken and executed.

A series of petty quarrels, and the tiresome story of the substitution of one ruling functionary for another, make up a great part of the subsequent history. The country became one of the four viceroyalties of Spanish America, and the Spanish authority was fully established and administered by successive viceroys. The province of Quito was separated from Peru in 1718; and in 1788, considerable territories in the s. were detached, and formed into the government of Buenos Ayres. At the outbreak of the war of independence in South America, the Spanish government, besides having much declined in internal strength, was distracted with the dissensions of a regency, and torn by civil war; nevertheless, in 1820, the Spanish viceroy had an army of 23,000 men in Peru, and all the large towns were completely in the hands of Spanish officials. Peru was the last of the Spanish South American possessions to set up the standard of independence. In Aug. 1820, a rebel army, under Gen. San Martin, one of the liberators of Chili, sailed for Peru, and, after a number of successes both on sea and land, in which the patriots were most effectively assisted by English volunteers, the independence of the country was proclaimed July 28, 1821, and San Martin assumed the protectorate of the young republic. From this date to the year 1860, 21 rulers, under various titles, have held sway. For the first 24 years of its existence as an independent republic the country was distracted and devastated by wars and revolutions. In 1845 Don Ramon Castilla was elected president; and under his firm and sagacious guidance the country enjoyed an unwonted measure of peace, and became regularly organized. Commerce began to be developed, and important public works were undertaken. The term of his presidency ended in 1851, in which year Gen. Rufino José Echenique was elected president. The country, however, was discontented, and Castilla again found himself, in 1855, at the head of affairs. Slavery, which, although abolished by the charter of independence, still existed, was put an end to by a decree dated Oct., 1854. In Aug., 1863, a quarrel had taken place at the estate of Talambo, in the north, between some Basque emigrants and the natives, in which several of the disputants were killed or wounded. Taking advantage of this occurrence, the Spanish government sent out a "special commissioner" in the spring of 1864, to complain of injuries sustained by Spaniards. The "commissioner" left Lima on April 12, and on the 14th, a Spanish squadron, under Admiral Pinzon, took forcible possession of the Chincha islands. The European consuls protested loudly against this outrage, and the Peruvians were greatly excited. War was, however, averted, president Pezet being unwilling to risk hostilities with Spain; and, in Jan., 1865, a treaty of peace was signed. This did not lead, however, to internal peace. The president was declared a traitor by the assembly in the same month that saw the treaty of peace ratified in the Spanish capital. Gen. Canesco, after a severe struggle, assumed the presidential authority, and retained it till November, when Col. Prado was nominated temporary dictator. The obnoxious treaty was now rejected, and Peru entered, January, 1866, into a treaty, offensive and defensive, with Chili (q.v.), which country was then at war with Spain; but this led to no serious consequences to Peru, an unsuccessful attack on Callao having vindicated Spanish honor. In October, Gen. Prado was regularly elected president, and, in Feb., 1867, he recommended a new constitution, which was formed and issued in July, when he was again elected president. At the close of 1867 the river Amazon was declared free for navigation to all nations, an event most auspicious for Peru as regards commercial prosperity and national influence. Prado was compelled to resign in 1868, and was succeeded by Col. Balta, who was assassinated in 1872.

The administration of his successor, Don Manuel Prado, was generally excellent, and from 1872 to 1875 the financial condition of the country was improved; and energy was displayed in the organization of a railroad system. But a failure in the product of guano, upon which Peru has chiefly relied for its advancement, brought about business prostration, and the destruction of Peruvian credit abroad; and the construction of public works necessarily ceased. In 1876 Col. Prado was for the second time elected president. Early in 1879 war broke out between Chili and Bolivia. The former country had transferred to the latter certain territory on condition that the Chilians residing therein

should be exempted from taxation, and that special mining and guano privileges should be guaranteed to the Chilians in the district under consideration. In consequence of this guarantee, which was made a part of specific treaty stipulation, a number of Chilian merchants and capitalists organized to develop the resources of the territory in question, and the towns of Antofagasta, Mejillones and Caracolas began to assume considerable importance on account of the investment in their vicinity. But the Bolivian congress having imposed an export duty on the nitrates of the district of Atacama; in direct contravention to the treaty which guaranteed that there should be no augmentation of export duties for twenty-five years; the result was an ultimatum from Chili, which followed this act by taking armed possession of Antofagasta, and the entire district of Atacama. This movement was met by a declaration of war, on the part of Bolivia, in Feb., 1879. A secret treaty existing between Peru and Bolivia brought Peru into the difficulty, notwithstanding the most earnest efforts were made by president Prado and the Peruvian diplomatic representative in Chili to avert such a conclusion. On April 6, war was declared against Peru; and the Chilian army, which had already entered Bolivia, became chiefly engaged in burning the sea-port towns of Peru, and everywhere driving its antagonists before it. Both Chili and Peru possessed navies: and sea-fights occurred without any conclusive result, until the destruction of the Peruvian iron-clad *Huascar* in October, which occurred near Antofagasta, after which Peru remained at a disadvantage. In November the Chilians attacked and routed the Bolivian army, and being in turn attacked by the Peruvians, were equally successful in that engagement, The Peruvian president, Prado, left Peru and went to New York and thence to Europe, when Nicholas de Pierola succeeded him as dictator. The latter put forth every energy to organize a powerful allied army, to oppose the invading Chilian force under gen. Baquedano. But in April, 1880, the latter captured Moquega, and in May, Tacna, two important cities in southern Peru; the allied armies experiencing a defeat at the latter place which was almost a rout. Early in June the same victorious general carried the supposably impregnable stronghold of Arica by storm, thus placing the Chilians in possession of the whole of southern Peru. In the meantime the Chilian fleet was blockading or pillaging the northern Peruvian sea-ports, and Baquedano organized an expedition against Lima. This expedition started in November, by water, and landed at Pisco, about 200 m. s. of Lima. The city of Lurin was first captured; and the Peruvians having made their last stand at Chorillos, a town in the suburbs of the capital, they were dislodged from there, and Lima surrendered on Jan. 17, 1881. After the fall of Lima some desultory fighting was done until a treaty of peace was concluded in the fall of 1883, which was ratified and exchanged some months later. P. ceded to Chili absolutely the province of Tarapaca, and for a term of 10 years the territories of Tacna and Arica ; at the close of this term the people of these territories were to decide by popular vote whether they will return to P. or remain under Chilian rule. Chili agreed to pay the creditors of P. 50 per cent. of the net proceeds from the guano and nitrate of soda trade, until the debt should be paid or the products exhausted; and received an indemnity from P. to pay for the maintenance of an army of occupation stationed in P. previous to the ratification of the treaty. Gen. Miguel Iglesias was recognized as the *de facto* pres. of P. The war left the country in a shattered and bankrupt condition, from which it has not yet recovered. At the present time the constitution of the country is modeled on that of the United States, the executive officer being a president, elected by popular suffrage for four years, and the legislative power being vested in the senate and house of representatives. In 1896 there was a separatist movement under Seminario, for the purpose of securing the independence of the department of Loreto, but it proved unsuccessful. Seminario had been instrumental in bringing president Nicolas de Pierola into power after the overthrow of the dictator Caceres, but, in 1896, Pierola's government showed signs of great weakness, and, besides the separatist movement, there was a formidable conspiracy on foot for his deposition. The two provinces of Tacna and Arica, whose future ownership was to be determined by plebiscite in 1894, were still retained by Chili, but the president's address on the opening of congress, July 28th, declared that Peru would exact from Chili the fulfillment of the promise in regard to these provinces.

PERU, a city in La Salle co., Ill., at the head of navigation, on the n. bank of the Illinois river, here spanned by a handsome bridge; on the Chicago, Rock Island and Pacific railroad; the terminus of the Illinois and Michigan canal; 100 m. s.w. of Chicago. It contains a public square, several public parks, St. Mary's hospital, public library, high school, electric light and street railroad plants, national and state banks, waterworks supplied from artesian well, rolling mills, breweries, and manufactories of zinc, sulphuric acid, clocks, plows, wheels, sash-doors, blinds, brick, and tile. The surrounding scenery is picturesque; the city has large trade by rail and water; and there are valuable bituminous coal mines near by. Pop. '90, 5550. The city is lighted with gas, and has a fire department. It has 4 grain elevators, several churches and public schools.

PERU, city and co. seat of Miami co., Ind.; on the Wabash river and the Wabash and the Lake Erie and Western railroads; 56 miles w.s.w. of Fort Wayne. It contains a public library, Wabash railroad hospital, electric light plant, waterworks supplied from the river with reservoir and direct pressure, national and state banks, shops of the Lake Erie and Western railroad, and manufactories of carbon, woolen goods, furniture, flour, glass, foundry products, baskets, carriages, flax, etc. Pop. '90, 7028.

PERU BALSAM, the product of a tall leguminous tree, *myrospernum peruiferum*, growing in a limited portion of San Salvador, Central America, and cultivated in Cey-

lon. It is a thick, glutinous substance, dark brown in color, has a fragrant balsamic odor, and contains cinnamic and benzoic acid, a resin, and alcohol. It was introduced into Europe about 1527, and was considered valuable for the treatment of bronchial and respiratory diseases, and in local applications for wounds and ulcers. The balsam is obtained by crushing or beating the bark of the trees, and, by a subsequent application of fire causing the bark to fall off in a few days, whereupon the balsam oozes from the trees thus laid bare, and is collected.

PERU'GIA, a province of n. Italy, compartimento of Umbria; 3,748 sq. m.; pop. estimated, Dec. '95, 604,987. Its surface is mountainous, crossed by several ranges of the Apennines, the highest spurs of which appear in the n. and s. portions. It borders on Arezzo, Pesaro ed Urbino, Ancona, Macerata, Ascoli-Piceno, Aquila, Rome, and Siena. It is intersected by the Tiber, and between the mountain ranges, are long, broad, fertile plains. Its soil is remarkably fertile, producing corn, wine, oil, fruit, and silk; honey is among the products, and live-stock is raised. Much attention is paid to the culture of bees, the vine, and tobacco. Marble, lime and building stones are largely exported. Its manufactures are silk goods, pottery, glass, iron-ware etc. It is divided into six districts. Capital, Perugia.

PERU'GIA, a city of central Italy, capital of the province of its own name, stands on a lofty elevation, 800 ft. high, on the right bank of the Tiber, 10 m. e. of the lake of Perugia (ancient *Lacus Trasimenus*), and 84 m. n. of Rome. It is surrounded with walls pierced with numerous gates, of which the *Arch of Augustus* (so called from the inscription *Augusta Perusia* over it, inscribed by Augustus) is the finest. It is the see of a bishop, and contains numerous churches, and many monastic establishments. Its streets are wide, and there are several squares lined with massive buildings. The broad Corso, which contains the finest edifices, unites two squares, one of which is occupied by the Duomo, or cathedral, dedicated to San Lorenzo, and dating from the end of the 15th century. It is in a fine, bold, Gothic style and contains many excellent paintings, carvings, etc. Many of the churches and convents are noble Gothic structures, and all of them are more or less famous for their pictures, some of which are by Raphael, Perugino, and other great masters. In the vicinity of the city, a number of Etruscan tombs, supposed to mark the site of the necropolis of ancient Perugia, have been discovered. The tombs contain numerous beautiful *cinerary urns*, in marble and travertine; and lamps, vases, bronze armor, ornaments, pateræ, etc., were also found, but have for the most part been removed to a neighboring villa. The university of Perugia, founded in 1320 is one of the free universities, and was attended (1894–95) by 306 students. It has various museums, and a library of 60,000 vols., with some valuable manuscripts. Besides the picture-gallery of the academy of fine arts, there are numerous private art-collections. Perugia contains also many interesting palaces, a beautiful fountain, an exchange, theaters, etc. Marble and earthenware, matches, glass and liqueurs, are manufactured; and a considerable trade is carried on in chestnuts, tobacco, oil, wine, and cattle. Pop. (comm.), Dec. '94, 63,400.

Perugia, the ancient *Perusia*, was one of the twelve Etrurian republics. It became tributary to Rome 294 B.C. During the war between Mark Antony and Augustus, it was taken by the latter, and was burned down. It was captured by the Goths under Totila at the fall of the Western Empire. Under pope Paul III., it was united to the papal states. In 1860, it became a part of the kingdom of Italy under Victor Emmanuel.

PERUGIA, Lake of. See Trasimenus Lacus.

PERUGINO, a celebrated Italian painter, whose real name was Pietro Vannucci, was b. at Citta della Pieve in Umbria, about 1446, but having afterwards established himself in the neighboring and more important city of Perugia, where he had the right of citizenship, he is commonly called Il Perugino. It is generally thought that he studied under Andrea Verocchio at Florence. He executed numerous excellent works in various cities, particularly in Florence, Siena, Pavia, Naples, Bologna, Rome, and Perugia. Sixtus IV. employed him in the Sistine chapel; and his fresco of "Christ giving the keys to Peter" is by far the best of those painted on the side-walls of that chapel. He also, along with other contemporary painters, decorated the Stanze of the Vatican; and his works there are the only frescos that were spared when Raphael was commissioned to substitute his works for those formerly painted on the walls and ceilings. The fact of his having had Raphael for his pupil has no doubt, in one way, increased the reputation of Perugino, but it has also in some degree tended to lessen it, as in many of Perugino's best productions, the work of Raphael is confidently pointed out by connoisseurs, and, indeed, many important pictures, at one time acknowledged as his, are now ascribed to his great pupil. His high standing as a painter, however, is established by many admirable works, in which no hand superior to his own could have operated; and, with the exception, perhaps, of Francia, who in some respects is esteemed his equal, he is now acknowledged as the ablest of the masters of that section of the early Italian school in which religious feeling is expressed with great tenderness, in pictures remarkable for delicate execution. Perugino's works are also distinguished by rich and warm coloring. An excellent example of this master's work may be studied in the collection of the national gallery, London—"No. 288. The Virgin Adoring the Infant Christ." Perugino's reputation was high, when the introduction of the cinquecento style, by Leonardo and Michael Angelo, tended to throw into the shade the art of the earlier masters. Disputes ran high between the leaders of the old and new styles, and Michael Angelo is said

to have spoken contemptuously of Perugino's powers. This, of course, has biased Vasari's opinion in his estimate of the opponent of his idol, but Perugino's reputation now stands very high, and his works are greatly esteemed. Raphael was about 12 years of age when he was entered as a pupil with Perugino, who was then (1495) engaged on the frescos in the Sala del Cambia (the Exchange) at Perugia. Perugino died at Castello di Fontignano, near Perugia, in 1523.

PERU'VIAN ARCHITECTURE. Although the buildings of Peru were erected probably about the 12th c. A.D., they possess an extraordinary likeness to those of the Pelasgi in Europe. This resemblance in style must be accidental, arising probably from the circumstance, that both nations used bronze tools, and were unacquainted with iron. The Peruvian walls are built with large polygonal blocks of stone, exactly like what we call "Cyclopean masonry." The jambs of the doorways slope inwards, like those of Etruscan tombs, and have similar lintels. The walls of Cuzco are good examples of this style. It is further remarkable, that these walls are built with re-entering angles, like the fortifications which were adopted in Europe only after the invention of gunpowder.

PERUVIAN BARK. See CINCHONA. An important instance of commercial enterprise, directed to providing relief for human suffering, has been the introduction of cinchonas, or Peruvian-bark trees, into British India. This had long been urged on the East India company by Dr. Royle, but was not undertaken till after his death. The same thing had been attempted a year or two before by the Dutch in Java, on the urgent representations of the botanist Blume, but with very imperfect success, owing to their having procured chiefly plants of a species which produces bark of very inferior quality, and yields little quinine. But Mr. Markham, who was sent to South America by the East India company to procure seeds and plants, was successful in introducing into British India, in the latter part of 1861, a number of the very best species, which were planted chiefly on the Neilgherry hills, and partly also on the mountains of Ceylon and the Himalaya, and from these stations have been diffused throughout the Madras presidency. There are now about 2,700,000 cinchona trees on the government plantations, and the harvest for 1875 amounted to 65,200 lbs., worth about £6,700. The whole yield of the Madras presidency is about double that, 204,000 lbs. having been brought into the London market in 1877–78. Thus an abundant supply of Peruvian bark, and consequently of quinine, has been secured at a moderate price, and yet with profit to the cultivator. In procuring the young trees and seeds which he conveyed to India, Mr. Markham experienced great difficulty from the jealousy of the South American governments, anxious to maintain a rigid monopoly in this precious commodity, and yet taking no effectual means to prevent the rapidly extending waste of the trees in their native forests. Mr. Markham in all his travels saw only one Peruvian-bark tree which had been planted by the hand of man. (See Markham's *Travels in Peru and India*, 1862.)

PERUVIAN GOOSEBERRY. See PHYSALIS.

PE'RUWELS, a t. of Belgium in the province of Hainaut, with bleacheries, lime-kilns, and some linen manufactures. Pop. '90, 8272.

PERUZZI, BALDASSARE DA SIENA, 1481–1536; b. Volterra, Italy, of Sianese parents; son of Antonio Peruzzi. He studied the art of painting at Siena, and began his professional career at Rome. Among his first ambitious efforts were some frescos in the church of Sant Onofrio, in the church of San Rocco a Ripa, and in the fortress of Ostia; evincing remarkable genius, particularly one in chiaroscuro representing a siege by Roman warriors. Assisted by a liberal patron, Agostino Chigi, he studied architecture and ornamented many façades; among them the Farnese palace, the objects on which were mistaken by Titian for real persons; it was adorned with his fresco of the "History of Medusa." He is supposed to be the inventor of the architectural perspective painting perfected by Del Pozzo. In 1520 he succeeded Raphael as the architect of St. Peter's, appointed by Leo X. In 1527, when Rome was pillaged by constable Bourbon, he parted with all his effects and barely escaped with his life. He went to Siena, and his subsequent career, though fulfilling the promise of his youth, brought him little pecuniary reward. His work on the palazzo Massimi he did not live to complete. He was buried near Raphael in the Pantheon. His "Adoration of the Magi" is in the national gallery; also a drawing in chiaroscuro of the "Adoration of the Kings."

PERUZZI, UBALDINO, b. Florence, 1822; graduated at Siena, 1840, and subsequently at the Ecole des Mines in Paris. In 1848 he was sent to Vienna in the interest of the Tuscan government, and was *gonfaloniere* of Florence a short time previous to 1850, in which year he was removed. He was prominent in the overthrow of the Tuscan government, and became a member of the provisional government in April, 1859. Subsequently he went as envoy to Paris, and was deputy from Florence to parliament. In 1860 he was elected a member from Florence to the parliament at Turin, Tuscany having been united to the dominions of Victor Emmanuel. In 1861–62 he was minister of public works appointed by Cavour, and minister of the interior until Sept., 1864, when the Minghetti administration was overthrown. He succeeded Cambray Digny as syndic of Florence. He d. in 1891.

PESA'RO (the ancient *Pisaurum*), a t. of central Italy, in the province of Pesaro ed Urbino, on a rocky wooded hill, at the mouth of the Foglia, — 20 m. n.e. of Urbino. Its streets are broad, and it is surrounded by walls and defended by a citadel. It is a bishop's seat, and contains a cathedral and other churches. The country in the vicinity is fruit-

ful and beautiful. The town was destroyed in the time of Augustus by an earthquake. It was the birthplace of pope Innocent XI. The port, on account of the widening and strengthening of the river banks, is large enough to contain vessels of light draught. Silks, pottery, soap, and leather are manufactured; and an active trade in silk, oil, and hides is carried on. Pop. Dec. '94 (comm.), 25,400.

PESARO-E-URBINO, a province in Italy, bounded on the n. and n.e. by the Adriatic, on the s.e. by the province of Ancona, on the s. by the province of Perugia, and on the w. by Forli and Tuscany; 1118 sq. m.; pop. Dec. '95, 237,658. The surface is mountainous in the w., separated from Tuscany by the Appenines, and drained by the Foglia, Metauro, Cantiano, and Misa.

PESCARA. See AVALOS.

PESCHIE'RA, a fortified place of the first order of the kingdom of Italy, and before 1860 a member of the famous Quadrilateral (q.v.), stands partly on an island in the channel of the Mincio, and partly on the right bank of that river, at its outlet from the lake of Garda. The town itself is a poor place of less than 2,000 inhabitants. Peschiera commands the right bank of the river, and in connection with it is the extensive work called the "Salvi," which covers the approaches of the river in that direction. During the French republican war, Peschiera was a simple pentagon. Its fortifications, however, were greatly strengthened by the Austrians. It is defended by walls and by forts, lunettes, fosses, and a covered way; and the purpose which it is mainly intended to serve, besides that of forming an entrenched camp capable of accommodating a considerable number of troops, is to harass an army attempting to cross the Mincio by Goito or Valeggio. In the island portion of the town are extensive barracks, forming three sides of a square. Peschiera is a station on the Milan and Venice railway, and is also a military port on the lake of Garda. Peschiera was taken by the Piedmontese, under king Charles Albert in 1848, and was again invested by them in June, 1859, after the battle of Solferino. The conclusion of the treaty of Villafranca, however (July 11, 1859), relieved Peschiera fro.n a siege.

PE'SCIA, a t. in Tuscany, Italy, n.w. of Florence, on the Pescia, Lucca, and Pisa railroad; pop. of town 6300. The town is walled.

PESHAW'ER, or PESHAWUR, a municipality of British India, on the n.w. frontier, capital of a province of the same name, 13 m. e. of the eastern extremity of Khyber pass, and 150 m. e.s.e. of Cabul. It is defended by a bastioned wall, and commanded by a fort. The cantonment is very unhealthy. Pop. 84,200.

PESHI'TO, or rather PESHIT'TO (Syr. not, as generally supposed, "simple," "faithful," scil. version, but the "explained," i.e., translated, Bible), is the name given to the authorized Syriac version of the Old, and the greatest part of the New Testament. This version holds among the Syrian Christians the same place as the Vulgate in the Roman, and the "authorized version" in the English church. Many are the traditions about its origin. Thus, the translation of the Old Testament is supposed to date from the time of Solomon and Hiram; or to have been done by Asa, the priest; or, again, that it belongs to the time of the apostl Thaddæus (Adæus), and Abgar, the king of Osrhœne, in the 1st c. after Christ. To the same period is also supposed to belong the translation of the New Testament, which is ascribed to Achæus, a disciple of Thaddæus, the first Edessian bishop and martyr. Recent investigation has not as yet come to any nearer result than to place the latter vaguely in the 2d, and the former in the 3d c., and to make Judaic-Christians the authors of both. Ephræm Syrus (q.v.), who wrote in the 4th c., certainly speaks of the Peshito as *our* version, and finds it already necessary to explain some of its terms, which had become obsolete. Five books of the New Testament (the apocalypse and four of the epistles) are wanting in all the MSS., having probably not yet formed part of the canon when the translation was made. The version of the Old Testament was made direct from the Hebrew, and by men imbued with the Palestinian mode of explanation. It is extremely faithful, and astonishingly free from any of those paraphrastic tendencies which pervade more or less all the Targums or Aramaic versions. Its renderings are mostly very happy, and coincide in many places with those of the Septuagint, a circumstance which has given rise to the erroneous supposition, that the latter itself had been drawn upon. Its use for the Old Testament, is more of an exegetical, for the New Testament, more of a critical, nature. Anything like an edition of the Peshito worthy of its name, is still as much a desideratum as is a critical edition of the Septuagint or the Targums, and consequently investigators have as yet been unable to come to anything but very hazy conclusions respecting some very important questions connected with it. The *editio princeps* of the New Testament part dates Vienna, 1555, that of the Old Testament is contained in the Paris Polyglot of 1645. Several portions of the Peshito have been translated again into Arabic. The Syriac translation of those parts of the New Testament which are not to be found in the Peshito, but are now incorporated into our Syriac Bibles, are of late and uncertain date.

PESSIMISM, roughly speaking, is the doctrine that the pains of life are largely in excess of its pleasures; that life is a burden instead of a privilege; that everything in nature is ordered for or tends to the worst. It is the opposite of optimism (a term of earlier coinage), and although the word is a recent one, and the school of philosophers who have built up a metaphysical system known by this title date from the commencement of the present century, the theory itself is almost as old as the race. In their view

of the emptiness and weariness of this life, considered *per se* the modern pessimists differ little from the writer of the *Book of Job*, or of *Ecclesiastes*, or from the author of *De Contemptu Mundi*, and the whole school of Christian ascetics, though these, unlike the pessimists, believe that the evil of this present world is vastly outweighed by the universal good and the eternal life. In their doctrine that the nearest approach to happiness lies in the annihilation of desire, they differ only in terminology from the Buddhists, who for 2000 years have been aiming at Nirvâna; and even their terminology sometimes reveals a startling likeness. Wertherism in Germany, Renéism in France, Byronism in England—all are forms of Pessimism. Technically speaking, Pessimism originated with Schopenhauer, whose first book was published in 1819, although the term itself, as applied to his teachings, did not make its appearance until about 1865. Schopenhauer's avowed aim was to overthrow the optimistic theories of Liebnitz, to show that this was not only not the best possible world, but the worst. His works were at first neglected, in consequence of the superior popularity of the Hegelian philosophy, which he despised and reviled, but they eventually attracted a large body of disciples. The greatest of these is Hartmann, who, in his *Philosophy of the Unconscious* (1869), holds out the glorious hope that when humanity as a whole has acquired sufficient intelligence to recognize its own misery, it will destroy itself in a last despairing act of cosmic suicide See Optimism.

PESTALOZZI, Johann-Heinrich, was b. at Zürich, Jan. 12, 1745. His family belonged to the middle-class gentry. He was destined for the Christian ministry, but turned aside, however, from this profession, and betook himself to the study of law. To this pursuit he did not long remain constant. The perusal of Rousseau's *Émile*, and the unsatisfactory political condition in which he found Europe, united to disgust him with the artificial life of cities, and he accordingly removed to the country, to devote his life to farming. Purchasing some waste land (after he had acquired the necessary experience), he applied himself successfully to its cultivation, marrying about the same time the daughter of a wealthy merchant. His mind continuing to be afflicted by the contemplation of the unhappy condition of the masses of the people, he devoted himself during the intervals of his work to the consideration of the means best suited to promote their elevation. He was convinced that, by means of a sound education, a remedy might be found for the many evils by which he was surrounded, and by which society was infected. To give effect to his theories he converted his own house into an orphan asylum, and endeavored, by a judicious blending of industrial, intellectual, and moral training, to afford a specimen of sound education, and one so contrived as to be practicable as a national scheme. Meanwhile, the pursuit of his benevolent enterprises involved him, after the lapse of fifteen years (1775–90), in bankruptcy. The failure of his plans, and the democratic tendency of his opinions, brought upon him a good deal of contempt and opposition. His only consolation was having saved from degradation and neglect upward of 100 children, and having issued several volumes on education, containing the results of his experience, and his hopes for the future of the masses. Many subsequent attempts to found schools and to give a specimen of rational scholastic training, were made by Pestalozzi, with varying educational success, but with invariable pecuniary embarrassment. His writings, meanwhile, increased in number and importance. The great idea which lay at the basis of his method of intellectual instruction was, that nothing should be treated of except in a concrete way. *Objects themselves* became in his hands the subject of lessons tending to the development of the observing and reasoning powers—not lessons about objects. In arithmetic, he began with the concrete, and proceeded to the abstract; and into the teaching of writing, he for the first time introduced graduation. His special attention, however, was directed to the moral and religious *training* of children, as distinct from their mere *instruction;* and here, too, graduation, and a regard to the nature and susceptibilities of children, were conspicuous features of his system. Almost all Pestalozzi's methods are now substantially adopted by the instructors of elementary teachers in the normal schools of Europe, and to no man perhaps has primary instruction been so largely indebted. He died in 1827 at Brugg, in the canton of Basel, overwhelmed with mortifications and disappointments.

PESTH, the most populous and important commercial city of Hungary, on the left bank of the Danube, opposite Buda (q.v.), and 130 m. e.s.e. of Vienna. It occupies a low and level site, and contrasts strongly with the antique, picturesque, and rock-built Buda, on the other side of the river. The two cities are connected by a magnificent suspension bridge, erected in 1849, and which spans a water-way of 1245 feet, and also by two passenger bridges and a railway bridge, the latter below the town. The official name of the united cities is, since 1872, compounded of the two, in the form *Budapest*. Along the Pesth side of the river runs a wide quay, paved and terraced, and backed by a handsome row of buildings. The city consists of six divisions—the Inner, Leopold, Theresa, Elisabeth, Joseph, and Francis towns. The inner town, on the bank of the Danube, is the oldest, and the other divisions surround it in the form of a semicircle. Pesth is the seat of the chief judicial courts of Hungary. Its university, founded at Tyrnau, was transferred to Buda in 1780, and thence was removed hither in 1784. It is richly endowed, and in 1894 was attended by upward of 4000 students, while the professors and other teachers numbered 257. Attached to it are a museum, a botanic garden, an observatory, and a library. A handsome new chemical laboratory was opened in 1872, and there is a military academy established in accordance with the provisions of a decree passed in the same year. Of the chief buildings and

institutions the principal are the academy of sciences, founded in 1830; the new buildings (*neugebäude*)—an immense edifice, now used as barracks and as an artillery dépôt; the gymnasium; military school; academy of arts; national museum, with a library of 200,000 volumes, and valuable collections of coins, medals, and antiquities; veterinary school; the national and other theatres; and the society for Slavonic literature. The town contains several important silk-spinning factories, and the principal articles of manufacture are silk, cotton, leather, jewelry, and musical instruments. The grinding of grain into meal and flour are among the most important branches of industry. Four great fairs take place here annually, which draw together a concourse of more than 30,000 strangers, and at which exchanges, amounting in value to upwards of 32,000,000 florins, are made. The trade is chiefly in wines, hides, sugar, tobacco, and brandy. After Vienna, Pesth has the greatest trade of any city on the Danube. Pop. of Budapest, Dec. '90, 506,384.

Pesth is mentioned for the first time in the 12th c.; but although one of the oldest towns in Hungary, its importance dates only from the reigns of Maria Theresa and Joseph II. It was desolated by the Mongols in the 13th c.; and after the battle of Mohacs (q.v.), it fell into the hands of the Turks, who held it till 1686. At the beginning of the 18th c. it was an inconsiderable town, and has only risen into importance within the last 150 years. It has suffered much from inundations of the Danube on several occasions, on one of which, in 1838, 3,000 houses were destroyed. In May, 1849, while Görgei, with an army of 40,000 Hungarians, occupied the heights above Buda, and bombarded the fortress, which was held for the imperial government by gen. Hentzi, the latter gen. retaliated by bombarding Pesth; but on the night of May 20 the Hungarians stormed and took the fortress; and on the following morning raised above its battlements the standard of revolt. On the field of Rákos, in the vicinity, where the great national assemblies of the Magyars used to be held, horse-races, on the English model, now take place annually.

PESTILENCE. The terms plague and pestilence, corresponding to the Greek *loimos* and the Latin *pestis*, have until recent times been used indiscriminately to denote any diseases of an epidemic character which affected large masses of the community, and were remarkable for their fatality, such as the oriental plague, the sweating sickness, cholera, certain virulent forms of fever, etc. "Thus," says Dr. Craigie, in his learned work on *The Practice of Physics* (vol. i. p. 349), "the term *loimos* was applied by the Greeks to designate a species of epidemic remittent fever; and the plague of Athens described by Thucydides is manifestly an epidemic form of the same disease, which has been at all times in the summer season endemial on the coasts and islands of the Mediterranean and Archipelago. The instances of *loimos*, so frequently mentioned by Dionysius of Halicarnassus, and of *pestis*, so often mentioned by Livy and other Roman historians in the early history of Rome, are manifestly the remittent or remittent-continuous fever, which has been at all times the native product of that district, and which acquired, after inundations of the Tiber, or a certain train of weather, the characters of a very generally diffused, a very malignant, and a very mortal distemper. Numerous instances of a similar inaccurate mode of expression occur in designating the remittent fevers of the middle ages and of modern times; and we find, even in the early history of the colonization of the West Indian islands and the United States, frequent examples of the term plague being applied to the remittent fever of these regions, and especially to epidemic attacks of yellow fever." During the middle ages we find the term *pestis* applied to numerous disorders, such as syphilis, small-pox, erysipelas, epidemic sore throat, petecchial fever, the sweating sickness, gangrenous pneumonia, ergotism, etc.

Several Hebrew words are translated *pestilence* or *plague*, in the authorized version of the Old Testament. Some of these pestilences were sent as special judgments, and are beyond the reach of inquiry; others have the characteristics of modern epidemics, in so far as their action was not unnaturally rapid, and they were general in their attacks. Sufficient data are not in our possession to enable us to identify with certainty any of these epidemics. It has been supposed by some critics that in some of these cases (as in Deuteronomy, xxviii. 27; Amos, iv. 10; and Zechariah, xiv. 18; and in the case of Hezekiah) the oriental plague is referred to; but Mr. Poole (Smith's *Dictionary of the Bible*, vol. ii. p. 883) is of opinion that there is not any distinct notice of this disease in the Bible.

PETALUMA, a city in Sonoma co., Cal.; on the Petaluma river and the San Francisco and North Pacific railroad; 42 miles n. of San Francisco, with which it has daily communication by steamers. It is supplied with water from mountain springs, and has street railroads, gas and electric lights, public library, silk, woolen, flour, and planing mills, fruit canneries, Highland park, public plazas, about 12 churches, and several banks. Pop. '90, 3,692.

PETARD, an instrument for blowing open gates, demolishing palisades, etc. It consists of a half-cone of thick iron filled with powder and ball; this is firmly fastened to a plank, and the latter is provided with hooks, to allow of its being attached securely to a gate, etc. The engineers attached the petard, lighted the slow-match by which it was to be fired, and fled. When the explosion took effect a supporting column charged through the breach, while the defenders were yet in consternation. The petard has been almost

universally superseded by the use of powder-bags. Large petards contained as much as 13 lbs. of powder. See illus., CANNON, vol. III.

PETAU, DENYS (better known by the Latinized *Dionysius Petavius*) : 1583–1652 ; b. Orleans, France ; became prof. of philosophy in his 19th year at Bourges ; entered the Society of Jesus, 1605, and afterwards taught rhetoric and theology in the colleges of the order at Reims, La Flèche, and Paris. He published numerous controversial and philosophical works, the chief being a treatise on chronology, *De Doctrina Temporum*, 1627, which with his own abridgment, *Rationarum Temporum*, has been frequently reprinted, and his great, but unfinished, work *De Theologicis Dogmatibus*, 5 vols., 1644–50, which earned for him the title of "Restorer of Dogmatic Theology."

PETCHARY, the popular name of a number of species of the genus *tyrannus*, sometimes ranked with the shrikes (*laniadæ*), and sometimes with the fly-catchers (*muscicapidæ*). The name seems to be derived from the cry of the GRAY PETCHARY (*T. dominicensis*), a bird very common in the warm parts of America and in some of the islands of the West Indies, gregarious and migratory, spending the spring and summer in the islands, and retiring to the hottest parts of the main-land from the end of September to the beginning of January. Its cry is a kind of shriek, consisting of three or four shrill notes, incessantly repeated. The entire length of the gray petchary is about 9½ inches. It is a very bold and strong bird, and in defense of its young will maintain the battle against any hawk. It feeds partly on insects, sometimes on humming-birds, and partly on berries. When fat it is much esteemed for the table, and great numbers are shot on this account.—The COMMON PETCHARY (*T. caudifasciatus*) is one of the most common birds of the West Indies. At certain seasons of the year, when very fat, it is in great request for the table. This bird has been observed to play with a large beetle, as a cat does with a mouse, letting it drop and catching it before it can reach the ground.

PETCHO'RA, a large river in the n. of European Russia, rises on the western slope of the Ural mountains, flows n. through the eastern parts of the governments of Vologda and Archangel, then s.e., and finally sweeping toward the n., and expanding into an estuary 30 m. wide and full of islands, falls into the Arctic ocean, after a course of 983 miles. It is said to be navigable for large river-boats for 700 miles. It is free from ice 175 days in its upper course, and 127 days at Pustozersk.

PETEC'CHIÆ. This term is given to spots of a dusky crimson or purple color, quite flat, with a well-defined margin, and unaffected by pressure, which closely resemble flea-bites. These spots result from a minute extravasation of blood beneath the cuticle. They occur most frequently on the back, at the bend of the elbow, and in the groin. They indicate an altered state of the blood, and are often symptoms of very serious diseases, as of typhus fever, plague, scurvy, etc. They likewise occur in very severe cases of small-pox, measles, and scarlet fever, when their presence must be regarded as indicative of extreme danger.

PETER, SAINT, Apostle, named originally SIMON, was a native of Bethsaida, on the lake of Gennesaret. His father was called Jonas; and the name by which Peter is known in Christian history was given to him by our Lord, who changed his name of origin (Bar-Jona) into *Cephas*, a Syro-Chaldaic word, which means "rock" or stone, and for which *petra*, or, in the masculine form, *petros*, is the Greek equivalent. He was a fisherman by occupation, and, together with his brother Andrew, was actually engaged in this occupation on the sea of Galilee when our Lord called both to be his disciples, promising to "make them fishers of men." For this invitation they had been prepared by the preaching of John the Baptist, and they accepted it without hesitation. For the incidents recorded of Peter's life as a disciple, we must refer to the gospel narrative. These incidents all chiefly evince a warm and impulsive character, even down to the hour of weakness in which he denied his master. It is plain from the gospel narrative that he was regarded by our Lord with special favor and affection, and the events which followed the ascension of our Lord fall in with this inference from that narrative He was the first mover of the election of a new apostle in the room of Judas Iscariot; he was the spokesmen of the rest on the day of Pentecost; he it was who answered to the charges when they were brought before the council; he is the chief actor in the tragic scene of the death of Ananias and Sapphira; he was the first to break down the wall of the prejudice of race by receiving a Gentile convert into the church; he was the first to propound in the council of Jerusalem the question to be discussed as to the obligation of the Mosaic observances. The last incident of Peter's life supplied by the Scripture narrative is his presence in the council of Jerusalem, 49 A.D. Of his subsequent career, our only knowledge is derived from tradition. His special mission was to the Hebrew race, as Paul's to the Gentile; and he is supposed to have preached through Pontus, Galatia, Cappadocia, Asia, and Bithynia, chiefly to those of his own nation dispersed in these countries, all which are named in the address of the first of the two epistles which he has left. Another tradition which, until the 16th c., met general acceptance, reports that he preached at Rome, that he took up his residence there as bishop, and that he there suffered martyrdom. This tradition is the main foundation of the Roman claim to supremacy in the church. It early encountered the opposition of the reformers; its first antagonist being a writer named Velerius, whose work was published in 1520, and

who was followed by Flacius, Salmasius, and, above all, Spanheim. This view has found supporters in Bauer and the Tübingen school; but the main current of scholarship, Protestant as well as Catholic—from Scaliger, Casaubon, Usher, Pearson, Cave, etc., down to Neander, Gieseler, Bertholdt, Olshausen, and others in our own country—has accepted the Roman tradition without hesitation. The time of his going to Rome has also been the subject of much discussion. By some, he is alleged not to have gone to Rome till the year 63, or, at all events, a short time before his martyrdom; others date his first visit as early as 42 or 43, without, however, supposing his residence after this date to have been continuous. In his first epistle, it is implied that at the time of writing it he was at Babylon; and the name Babylon is by many critics held to be employed as a mystic designation of Rome, in accordance with a practice not unusual with the Hebrews and other orientals; but there is nothing to fix very conclusively the date of this epistle. He is held by Roman Catholic writers to have fixed his see at Antioch before his coming to Rome; but of this supposed event also, the date is uncertain. His martyrdom is fixed in, with much probability, the year 66, and is supposed to have been at the same time and place with that of St. Paul. Peter was sentenced to be crucified, and, according to the tradition (preserved by Eusebius from Origen), prayed that he might be crucified with his head downwards, in order that this death might exceed in ignominy that of his divine master.

PETER I., ALEXIEVITCH, Czar of Russia, generally denominated PETER THE GREAT, was the son of the czar Alexei Mikailovitch by his second wife, Natalia Naryskine, and was born at Moscow June 9, 1672. His father, Alexei, died in 1676, leaving the throne to his eldest son, Feodor, Peter's half-brother. This prince, however, died in 1682 without issue, after naming Peter as his successor, to the exclusion of his own full brother, Ivan. This step immediately provoked an insurrection, fomented by the children of the czar Alexei's first marriage, the most prominent among whom was the grand-duchess Sophia, a woman of great ability and energy, but of unbounded ambition. Disdaining the seclusion customary among the females of the royal family, she showed herself to the *Strelitz* (q.v.), excited them to fury by an ingenious story of the assassination of her brother Ivan, and then let them loose on the supporters of Peter's claims. After a carnage of three days, during which more than sixty members of the most noble families of Russia were massacred, she succeeded in obtaining the coronation (July, 1682) of Ivan and Peter as joint rulers, and her own appointment as regent. Up to Peter's coronation his education had been greatly neglected, but after this time he became acquainted with lieut. Franz Timmerman, a native of Strasburg, who gave him lessons in the military art and in mathematics; after which he had the good fortune to fall under the guidance of Lefort (q.v.), a Genevese, who initiated him into the sciences and arts of civilization, and by showing him how much Muscovy was in these respects behind the rest of Europe, influenced the whole of his future career. Lefort also formed a small military company out of the young men of noble family who attended Peter, and caused Peter himself to pass, by regular steps, from the lowest (that of drummer) to the highest grade in it, rendering him all the while amenable to strict discipline. This course of training, in all probability, saved Peter from becoming the mere savage despot, which his brutal and passionate disposition, and indomitable energy inclined him to be; it also protected him from the jealousy of his half sister, the regent Sophia, who, seeing him absorbed in military exercises and other studies, imagined that he had wholly given himself up to amusement. She, however, soon discovered her error, for Peter, contrary to her wishes, married (Feb., 1689), by his mother's advice, Eudoxia Feodorowna, of the family of Lapoukin; and in October of the same year, called upon his sister to resign the government. In the ensuing contest Peter was at first worsted, and compelled to flee for his life; but he was speedily joined by the foreigners in the Russian service, with a Scotchman named Patrick Gordon (q.v.) and the Swiss Lefort at their head; and the Strelitz, who were his antagonist's mainstay, flocking to his standard, she resigned the contest, and was shut up in a convent, whence, till her death, in 1704, she did not cease to annoy him by her intrigues. On Oct. 11, 1689, Peter made his public entry into Moscow, where he was met by Ivan, to whom he gave the nominal supremacy and precedence, reserving the sole exercise of power for himself. Ivan only enjoyed his puppet sovereignty till 1696. Though Peter was all his life under the dominion of ungovernable passions and sensual habits, yet during great part of his reign he was so exclusively engaged in projecting and carrying out his schemes for the regeneration of Russia, that his gross animal nature had little opportunity of displaying itself.

His first care on assuming the government, was to form an army disciplined according to European tactics, in which labor he was greatly aided by the valuable instructions of Gordon and Lefort, both of whom were military men, and had served in some of the best disciplined armies of western Europe. He also labored to create a navy, both armed and mercantile; but at this period Russia presented few facilities for such an attempt, for she was shut out from the Baltic by Sweden and Poland (the former of whom possessed Finland, St. Petersburg (then called Ingria), and the Baltic provinces), and from the Black sea by Turkey, which, extending along the whole of the north coast, had reduced that sea to the rank of an inland lake; leaving only the White sea and the Arctic ocean, with the solitary port of Archangel, available for the Russian navy. Peter thinking the possession of a portion of the Black sea would best supply the required

facilities of accessible sea-board and port, declared war against Turkey, and took (1696) the city of Azof at the mouth of the Don, after a long siege, which the ineffective condition of his newly-disciplined army compelled him to convert into a blockade. Skilled engineers, architects, and artillerymen were now invited from Austria, Venice, Prussia, and Holland; ships were constructed; the army further improved both in arms and discipline; and many of the young nobility ordered to travel in foreign countries, chiefly in Holland and Italy, for the purpose of acquiring such information as might be useful in the modernization and civilization of their country. They were ordered to take special notice of all matters in connection with ship-building and naval equipments. Others were sent to Germany to study the military art. Not quite satisfied with this arrangement, Peter was eager to see for himself the countries for which civilization had done so much, and which had so highly developed the military art, science, trade, and industrial pursuits; so after repressing a revolt of the Strelitz (Feb., 1697), and dispersing them among the various provinces, he intrusted the reins of government to Prince Romonadofski, assisted by a council of three, and left Russia in April, 1697, in the train of an embassy of which Lefort was the head. In the guise of an inferior official of the embassy he visited the three Baltic provinces, Prussia, and Hanover, reaching Amsterdam, where, and subsequently at Saardam, he worked for some time as a common shipwright. His curiosity was excessive; he demanded explanations of everything which he did not understand; and to his practice of ship-building and kindred trades, he added the study of astronomy, natural philosophy, geography, and even anatomy and surgery. On receipt of an invitation from William III., king of England, he visited that country, and for three months, spent partly in London and partly at Deptford, labored to amass all sorts of useful information. When in England he received the honorary degree of D.C.L. from the university of Oxford. He left England in April, 1698, carrying with him English engineers, artificers, surgeons, artisans, artillerymen, etc., to the number of 500, and next visited Vienna, for the purpose of inspecting the emperor of Austria's army, then the best in Europe. He was about to visit Venice also, when the news of a formidable rebellion of the Strelitz recalled him to Russia, which he reached by way of Poland, arriving at Moscow Sept. 4, 1698. Gen. Gordon had already crushed the revolt, but these turbulent soldiers had so enraged Peter against them by their frequent outbreaks, that he ordered the whole of them to be executed, even occasionally assisting in person on the scaffold. A few, however, were pardoned, and sent to settle at Astrakhan. The czarina Eudoxia, who was suspected of complicity in the conspiracy, which had been the work of the old Russian or anti-reform party, was divorced, and shut up in a convent; the czar's own sister, Martha, was likewise compelled to take the veil. To show his gratitude to his faithful adherents, Peter conferred upon the chief of them the order of St. Andrew, now first instituted. He put the press on a proper footing, caused translations of the most celebrated works of foreign authors to be made and published, and established naval and other schools. At this period, the ordinary arithmetic was first introduced for the management of accounts, these having been previously kept by means of balls strung on a wire (the Tartar method). Peter also introduced the mode of raising revenue by taxation of commodities in common use. Trade with foreign countries, which was formerly punished as a capital crime, was now permitted, or rather, in the case of the principal merchants, insisted upon. Many improvements in dress, manners, and etiquette were introduced authoritatively among the public functionaries, and recommended to the people at large. Even the organization of the national church could not escape Peter's reforming zeal.

In 1700, Peter, desirous of gaining possession of Carelia and Ingria, provinces of Sweden, which had formerly belonged to Russia, entered into an alliance with the kings of Poland and Denmark to make a combined attack on Sweden, taking advantage of the tender age of its monarch, Charles XII.; but he was shamefully defeated at Narva; his raw troops being wholly unable to cope with the Swedish veterans. Peter was by no means disheartened, for, taking advantage of the Swedes being employed elsewhere, he quietly appropriated a portion of Ingria, in which he laid the foundation of the new capital, St. Petersburg, May 27, 1703. Great inducements were held out to those who would reside in it, and in a few years it became the Russian commercial dépôt for the Baltic. In the long contest with Sweden, the Russians were almost always defeated, but Peter rather rejoiced at this, as he saw that these reverses were administering to his troops a more lasting and effective discipline than he could have hoped to give them in any other way. He had his revenge at last, in totally routing the Swedish king at Poltava (q.v.), July 8, 1709, and in seizing the whole of the Baltic provinces and a portion of Finland in the following year. His success against Sweden helped much to consolidate his empire, and to render his subjects more favorably disposed towards the new order of things. After re-organizing his army, he prepared for strife with the Turks, who, at the instigation of Charles XII. (then residing at Bender), had declared war against him. See OTTOMAN EMPIRE. In this contest Peter was reduced to such straits that he despaired of escape, and, looking forward to death or captivity, wrote a letter to his chief nobles, cautioning them against obeying any orders he might give them while a captive, and advising them regarding a successor to the throne in case of his death. But the finesse and ability of his mistress, Catharine, afterwards his wife and successor (see CATHARINE I.), extricated him from his difficulties; and a treaty was con-

cluded (July 23, 1711) by which Peter lost only his previous conquest—the port of Azof and the territory belonging to it. Shut out from the Black Sea, the possession of a good sea-board on the Baltic became the more necessary to him, and the war against Sweden in Pomerania was accordingly pushed on with the utmost vigor. On March 2, 1712, his marriage with his mistress, Catharine, was celebrated at St. Petersburg; and two months afterwards the offices of the central government were transferred to the new capital. His arms in Pomerania and Finland were crowned with success, and in 1713 the latter province was completely subdued. Peter neglected nothing to develop the naval power of the empire, and the strictness with which he enforced the discharge of their duties on his ministers and officers, appears from the refusal, by the court of admiralty, of the czar's own application for the grade of vice-admiral, until by defeating the Swedish fleet at Hangoend, and taking the Aland isles, and several coast-forts in Finland, he had merited the honor. In the end of 1716, and beginning of 1717, in company with the czarina, he made another tour of Europe, this time visiting Paris, where he was received with great empressement, and returned to Russia in Oct., 1717, carrying with him books, paintings, statutes, etc., to a large amount. It was soon after this time that he ordered his son Alexei (q.v.) to be executed, and many of the nobles who had been implicated in his treasonable plans were punished with savage barbarity. In 1721 peace was made with Sweden, and on condition of that power giving up the Baltic provinces, Ingria (now government of St. Petersburg), Viborg, and Kexholm, and a small portion of Finland, with all the islands along the coast from Courland to Viborg, she received back the rest of Finland, with a sum of $2,000,000. In 1722 Peter commenced a war with Persia, in order to open up the Caspian Sea to Russian commerce (see Persia). The internal troubles of Persia compelled the shah to yield to the demands of his formidable opponent, and to hand over the three Caspian provinces along with the towns of Derbend and Baku. On Peter's return to his capital, he inquired into the conduct of his finance ministers, and punished with fines, imprisonment, and even death, those whom he detected in fraudulent acts. To save the empire which he had established and constituted from being abandoned to the weak government of a minor, he, in Feb., 1722, promulgated his celebrated law of succession (see Peter II.). For the last years of his life he was chiefly engaged in beautifying and improving his new capital, and carrying out plans for the more general diffusion of knowledge and education among his subjects. In the autumn of 1724 he was seized with a serious illness, the result of his imprudence and now habitual excesses; and after enduring much agony, he expired, Feb. 8, 1725, in the arms of the empress. See Waliszewski, *Peter the Great* (1897).

PETER II., ALEXEIVITCH, Czar of Russia, was the sole male representative of Peter the Great, being the son of the unfortunate Alexei (see Peter I.) by his wife the princess Charlotte of Brunswick-Wolfenbuttel, and was born Oct. 23, 1715, at St. Petersburg. On the death of the czarina Catharine I., he ascended the throne, May 17, 1727, in accordance with a decree of Peter the Great, which enjoined that each czar should name his successor; and the ambitious Menchikoff, who hoped to govern more easily in the name of a minor, prompted the empress to choose Peter. In order to secure himself in his high position, Menchikoff affianced one of his daughters to the youthful czar, and compelled his relative, Anna Petrowna, and her husband, the duke of Holstein, to retire to their own estates. But, notwithstanding these and other precautions, his power was overturned by a mere child, a playfellow of the boy-ruler, who was of the powerful family of Dolgorouki. Instigated by his friends, this boy, Ivan Dolgorouki, opened the eyes of his sovereign to the humiliating dependence in which he was held by Menchikoff, and inspired him with a strong desire to free himself. The plan succeeded, and the minister and his family were exiled to Siberia, the Dolgorouki family taking their place as favorites. The marriage of a lady of this family with Peter had been arranged, and was almost on the point of being celebrated, when he was seized with small-pox, and died at St. Petersburg, Jan. 29, 1730. During his reign the three Caspian provinces, Asterabad, Ghilan, and Mazanderan, which had been seized by Peter the Great, were recovered by Persia.

PETER III., FEODOROVITCH, Czar of Russia, grandson of Peter the Great (being the son of his eldest daughter Anna Petrowna, wife of Karl Friedrich, duke of Holstein-Gottorp), was born at Kiel, Mar. 4, 1728, and on Nov. 18, 1742, was declared by the czarina Elizabeth (q.v.), her successor on the throne of Russia. From the time of his being publicly proclaimed heir, he lived at the Russian court; and, in obedience to the wishes of the czarina, married Sophia-Augusta, a princess of Anhalt-Zerbst, who, on entering the Greek church (a necessary condition of marriage of a foreigner with the czar present or presumptive), assumed the name of Catharina Alexiowna. Peter succeeded Elizabeth on her death, June 5, 1762; and his first act of authority was to withdraw from the confederate league of France, Austria, and Russia against Prussia, restoring to the heroic monarch of the latter kingdom, Frederic II., the provinces of Prussia Proper, which had been conquered during the seven years' war, and sending to his aid a force of 15,000 men; a line of conduct which seems to have been prompted solely by his admiration for the Prussian sovereign. He also recalled many of the political exiles from Siberia, among whom were L'Estocq, Munnich, and the duke of Courland; abolished the sanguinary law which proscribed any one who should utter a word against the

Greek church, the czar, or the government; and then attempted the realization of his favorite project, which was to recover from Denmark that portion of Slesvig which had been ceded to her in 1713, and to avenge the tyranny and annoyances to which his family —that of Holstein-Gottorp—had been subjected But before the army he had dispatched could reach its destination, a formidable conspiracy, headed by his wife, and supported by the principal nobles, had broken out against him. This conspiracy originated in the general discontent which was felt at the czar's conduct and government, for the nobility were offended at his liberal innovations, and the preference he showed for Germans; the people and clergy, at his indifference to the national religion, and his ill-concealed contempt for Russian manners and customs; while the whole nation murmured at his servility to Frederic II. of Prussia. His wife had still deeper cause for dislike; for though he was himself addicted to drunkenness and debauchery, he never ceased to reproach her with her infidelities, and had even planned to divorce her, disinherit her son Paul (q.v.), and elevate his mistress Elizabeth Woronzof to the conjugal throne. The revolution broke out on the night of July 8, 1762; Peter was declared to have forfeited his crown, and his wife Catharine was proclaimed czarina as Catharine II. (q.v.) by the guards, the clergy, and the nobility. Peter who was then at Oranienbaum, neglecting the counsels of field-marshal Munnich, who proposed to march at once on the capital at the head of the regiments which were still faithful, or at any rate to take secure possession of Cronstadt and the fleet, soon found even the opportunity of flight cut off, and was compelled to submit. He abdicated the crown on July 10, and on the 17th of the same month was put to death by Orloff (q.v.), to secure the safety of the conspirators.

PETER (Don Pedro) **THE CRUEL**, King of Castile and Leon, was the son of Alfonzo XI. and Maria of Portugal, and was born at Burgos, Aug. 30, 1334. On his father's death (1350), Peter succeeded to the throne without opposition, but left the whole exercise of power to his mother, Donna Maria, and Albuerque, his father's prime minister and chancellor. But by the instigation of his mistress (afterward his queen), Marie de Padilla, Peter emancipated himself (1353) from the guidance of the queen-mother and her coadjutor Albuerque, taking the reins of government in his own hands. His rule being much more impartial than that of the regency, obtained exceeding popularity, which was increased by his affable manner towards the mass of his subjects; but the strict justice with which he decided all causes between the rich and poor, the clergy and the laity, combined with a haughty and imperious carriage toward them, alienated from him the nobles and clergy. The plottings of Albuerque, who had fled to Portugal, having culminated (1354) in an outbreak in the province of Estremadura, Peter marched against the rebels, but was betrayed by his brother, Henry of Trastamare, and taken prisoner (Dec., 1354). Popular opinion now declared loudly in his favor; and having escaped from prison, he found himself speedily at the head of a powerful army, with which, despite the excommunication of the pope, he speedily reduced his opponents to submission. But this episode in his career had a disastrous influence on his character for the rest of his life. Betrayed by his relatives, and even by his mother, he became suspicious of every one; and having experienced to the full the power of his enemies, he scrupled not as to the weapons to be employed against them. The rest of his reign was devoted to the destruction of the power of the great vassals, the establishment of his own authority on the ruins of their feudal tyranny, and long-continued and bloody wars with the kingdoms of Aragon and Granada. As the people, however, were in general well and justly governed, it is not improbable that he might have retained his throne in spite of his numerous enemies, had not the heavy taxes which were imposed to maintain the cost of his long wars with Aragon and Granada dissipated his popularity. Henry, who had fled to France, now seizing the favorable opportunity, returned (1366) at the head of a body of exiles, backed by Bertrand du Guesclin (q.v.) with an army of mercenaries, and aided by Aragon, France, and the pope. Peter, however, by promising to England the seaboard of Biscay, with the provinces of Guipuzcoa and Logrono, and supplying a contribution of 56,000 florins, prevailed upon Edward the Black Prince to espouse his cause. Edward invaded Castile in the spring of 1367, totally defeated Henry aud Du Guesclin at Navarette (April), taking the latter prisoner (releasing him almost immediately after), and speedily restoring Peter to the throne. But the king disgusted his chivalrous ally by his cruelty to the vanquished, and paid no heed to his remonstrances; Edward accordingly repassed the Pyrenees, and left the misguided monarch to his fate. The whole kingdom groaned under his cruelties; rebellions broke out everywhere; and, in autumn 1367, Henry returned with 400 lances, the people immediately flocking to his standard. Peter's scanty and ill-disciplined forces were routed at Montiel (Mar. 14, 1369), and himself compelled to retire for safety within the town, whence he was treacherously decoyed and captured by Du Guesclin. He was carried to a tent, where a single combat took place between him and Henry, in which the latter would have been slain, had not some of his followers come to his aid, and slain the unfortunate Peter, Mar. 23, 1369.

PETER THE HERMIT, the first mover of the great mediæval drama of the Crusades (q.v.), was of gentle birth, and a native of Amiens, where he was born about the middle of the 11th century. Having been educated at Paris, and afterward in Italy, he became a soldier. After serving in Flanders without much distinction, he retired from the

army, married, and had several children; but on the death of his wife he became a monk, and ultimately a hermit. In the course of a pilgrimage to the holy land about 1093, he was moved by observing that the holy sepulcher was in the hands of the infidel, as well as by the oppressed condition of the Christian residents or pilgrims under the Moslem rule; and on his return, spoke so earnestly on the subject to pope Urban II., that that pontiff warmly adopted his views, and commissioned him to preach throughout the west an armed confederation of Christians for the deliverance of the holy city. Mean in figure, and diminutive in stature, his enthusiasm lent him a power which no external advantages of form could have commanded. "He traversed Italy," writes the historian of Latin Christianity, "crossed the Alps, from province to province, from city to city. He rode on a mule, with a crucifix in his hand, his head and feet bare; his dress was a long robe, girt with a cord, and a hermit's cloak of the coarsest stuff. He preached in the pulpits, on the roads, in the market-places. His eloquence was that which stirs the heart of the people, for it came from his own—brief, figurative, full of bold apostrophes; it was mingled with his own tears, with his own groans; he beat his breast: the contagion spread throughout his audience. His preaching appealed to every passion—to valor and shame, to indignation and pity, to the pride of the warrior, to the compassion of the man, the religion of the Christian, to the love of the brethren, to the hatred of the unbeliever aggravated by his insulting tyranny, to reverence for the Redeemer and the saints, to the desire of expiating sin, to the hope of eternal life." The results are well known, as among those moral marvels of enthusiasm of which history presents occasional examples. All France, especially, was stirred from its very depths; and just at the time when the enthusiasm of that country had been already kindled to its full fervor, it received a sacredness and an authority from the decree of a council held at Clermont, in which Urban himself was present, and in which his celebrated harangue was but the signal for the outpouring, through all western christendom, of the same chivalrous emotions by which France had been borne away under the rude eloquence of the hermit. For the details of the expedition we must refer to the article CRUSADES, our sole present concern being with the personal history of Peter. Of the enormous but undisciplined army which assembled from all parts of Europe, one portion was committed to his conduct, the other being under the command of a far more skillful leader, Walter the Pennyless. Peter placed himself at their head, mounted upon his ass, with his coarse woolen mantle and his rude sandals. On the march through Hungary, they became involved in hostilities with the Hungarians, and suffered a severe defeat at Semlin, whence they proceeded with much difficulty to Constantinople. There the emperor Alexis, filled with dismay at the want of discipline which they exhibited, was but too happy to give them supplies for their onward march; and near Nice they encountered the army of the sultan Solyman, from whom they suffered a terrible defeat. Peter accompanied the subsequent expedition under Godfrey, but worn out by the delays and difficulties of the siege of Antioch, he was about to withdraw from the expedition, and was only retained in it by the influence of the other leaders, who foresaw the worst results from his departure. Accordingly, he had a share, although not marked by any signal distinction, in the siege and capture of the holy city in 1099, and the closing incident of his history as a crusader was an address to the victorious army delivered on the mount of Olives. He returned to Europe and founded a monastery at Huy, in the diocese of Liege. In this monastery he died, July 7, 1115.

PETER CLAVER, 1582–1654; b. in Catalonia. He joined the Jesuits at Tarragona in 1602, and in 1610 went to Cartagena, the center of the African slave-trade. He was soon afterward ordained priest, and from that time devoted himself to the care and instruction of the slaves on their arrival from Africa. To gain consent of the authorities for access to the slaves, he signed himself the "slave of the negroes forever," and thenceforth lived among them on shipboard and in the hospitals, especially the leprosy-hospitals, ministering to their wants, and eating only the refuse of their food. A body of catechists that he organized, aided him in the instruction of the slaves. His exertions during the plague in Cartagena resulted in utter exhaustion and paralysis. He was beatified by Pius IX. in 1853. His life was written in Spanish and French.

PETERBORO', a co. in central Ontario, Canada, drained by the Obanobee river, traversed by the Midland railroad; about 2500 sq. m.; pop. '91, 37,727. Co. seat, Peterboro'.

PETERBORO', town and co. seat of Peterboro' co., Ontario, Canada; on both sides of the Otonabe river; 76 miles n.e. of Toronto; connected by a handsome bridge with the village of Ashburnham opposite, and on the Canadian Pacific and the Grand Trunk railroads; pop. '91, 9717. The town is lighted with gas, has good water power, and manufactories of leather, engines, farming tools, wooden ware, and woolens. It has a large export trade in grain, pork, and lumber.

PETERBOROUGH, an episcopal city, parliamentary borough and since 1871, a municipal borough of Northamptonshire, stands on the left bank of the Nen — which is thus far navigable for boats — 37 m. n.e. of Northampton, and 76 m. n.n.w. of London by railway. The Great Northern, the London and Northwestern; the Great Eastern and the Midland railways pass the city, and have stations here. Peterborough is regularly laid out, has an excellent grammar-school with an endowment, a corn-exchange

in the Italian style a jail and house of correction, a handsome parish-church, and a number of chapels and meeting houses, schools, and charitable institutions.

But the great edifice of Peterborough is the famous cathedral, which holds a high, if not the highest rank among English cathedrals of the second classs. The choir and eastern aisles of the transept (built 1118–33) are early Norman; the transept (1155–77) is middle Norman; the nave (1177–93) is late Norman; the western transept (dating from the same period), is transition Norman; the w. front, which, as a portico (using that term in its classical sense), is said to be the grandest and finest in Europe, is early English; and the eastern aisle (begun in 1438, but not completed till 1528), is perpendicular. The beautiful western front consists of three arches 81 ft. in height, supported by triangular piers detached from the w. wall. Each arch is surmounted by a beautiful pediment and cross. The front is flanked on each side with turrets 156 ft. high, and crowned with pinnacles. The roof of the nave is painted in lozenge-shaped divisions, containing figures of kings, bishops, grotesques, etc., in colors. A central tower, lantern-shaped, rises at the intersection of the nave and transept; this being condemned as unsafe has recently been rebuilt. In the north-choir aisle, a slab of blue stone still covers the remains of Catharine of Aragon. On the stone is carved the simple inscription, "Queen Catharine, A.D. 1536." In July, 1587, the remains of Mary, queen of Scots, were brought here from Fotheringay for interment, and here they rested until, 25 years after, they were removed to Westminster Abbey. The entire length of the cathedral is 476 ft. 5 in.; the breadth of nave and aisles, 78 ft.; height of the ceiling of the church, 78 ft.; breadth of the church at the great transepts, 203 ft.; height of lantern, 135 ft.; length of western front, 156 ft.; height of central tower from the ground, 150 feet.

Peterborough carries on an active trade in corn, coal, timber, bricks, and malt. It has also manufactures of agricultural implements. The G. N. R. have extensive locomotive works in the north suburb. There are many fairs: Pop. '91, of parl. bor. 26,500.

The original name of the town was Medeshamstede. The city had its origin in a great Benedictine monastery, founded in 655 by Oswy, king of Northumbria, and Peada, son of Penda, king of Mercia. This monastery, which became one of the wealthiest and most important in England, was reared in honor of St. Peter; but it was not until after being destroyed by the Danes in 807, and rebuilt about 966, that the town was called Peterborough. On the dissolution of the monasteries, this magnificent edifice was spared, owing, it is supposed, to its containing the remains of Queen Catharine of Aragon. See Murray's *Handbook;* Poole's *Peterborough.*

PETERBOROUGH, Lord. See Mordaunt.

PETER, EPISTLES GENERAL OF, the name given to two epistles contained in the canon of the New Testament. They are called *general,* because they are not addressed to particular churches or persons, like those of St. Paul; but (as in the case of the 1st epistle) to all the Christians scattered throughout Asia Minor, or (as in the case of the 2d) to the entire body of Christians without exception. The objects of the 1st epistle are to strengthen believers under trials; to exhort them to the earnest performance of all duties—personal, social, and domestic; and to demonstrate how thoroughly that performance depends on a spiritual recognition of Christ and his work. There is a strong eschatological tendency in the epistle; the apostle seems to grow more intensely serious, under the conviction that "the end of all things is at hand" (chap. iv. 7). That the epistle is the composition of Peter is very generally admitted. The external evidence is singularly strong; while the internal, derived from a consideration of style, sentiment, and doctrine, is equally so. We see in every sentence the ardent, impassioned, practical, unspeculative character of Peter, who held with a fine Hebraic vehemence of faith the great facts and principles of Christianity, but could not, like the more subtle and logical Paul, give them a systematic representation. Many critics have warmly praised the beauty and strength of the language.—The *second epistle* stands in a very different position from the first. So far as external authority is concerned, it has hardly any. The most critical and competent of the fathers were suspicious of its authenticity; it was rarely, if ever, quoted, and was not formally admitted into the canon till the council of Hippo, 393 A.D. The internal evidence is just as unsatisfactory. The great difference of style between it and the 1st epistle is universally admitted. Bunsen, Ullmann, and Lange hold indeed that the second chapter is an interpolation, but consider the first and third genuine. Many of the ablest critics, however, regard the whole epistle as a fabrication; and believe that its contents prove it was meant as an attack on the Gnosticism of the 2d century. [See the remarks on the second epistle of Peter in Neander's *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel.*] The principal arguments adduced for maintaining its apostolic character are: 1. that its rejection would endanger the authority of the canon: 2. that it is inexplicable how the church should have received it if it had not thought that Peter was the author.

PETERHEAD, a sea-port and municipal and parliamentary burgh, in the district of Buchan, Aberdeenshire, on a peninsula, the eastmost point of land in Scotland, 44 m. n.n.e. of Aberdeen, by railway. Keith Inch, the eastern head of the peninsula and the nucleus of the town, is now separated by the harbor and is mainly occupied by fish-curing establishments. It is irregularly built, clean, and much paved with the reddish granite, called after the town, and used for polishing. The earls of Marischal, before their attainder, 1715, owned much of the parish, and were superiors of the town of Peterhead. The property was bought by the Merchant Maiden hospital of Edinburgh, the governors of which have greatly improved the town and port. Peterhead has no very striking edifices. The parish church has a granite spire, 118 ft. high, and a granite

Tuscan pillar stands on the market-cross. Peterhead has Episcopal, Free, Roman Catholic and other churches; an academy and other schools, and libraries. The chief exports are herrings, butter, grain, and granite. Peterhead was long the chief British depot of the seal fisheries and the Greenland whale fisheries carried on since 1788. It has 500 boats employed in the herring fishery. P. has a harbor on the n. with two basins, another on the s. with 600 ft. by 350 ft., with 1,500 ft. of quayage. The third or Port Henry harbor has an area of 5 acres and 850 ft. of quayage. Besides these there is a large "harbor of refuge" which has been undertaken at the national expense. On the s. side of the bay of Peterhead, and about 2½ m. from the town, are the Buchanness and its light-house, and Boddam castle ruins. The Ugie enters the sea a mile n.w. of Peterhead; and on its banks, 3 or 4 m. n.w. of the town, are the ruined castles of Inverugie and Ravenscraig. The walls of the former are still standing, and access is obtained to the roof by means of a winding staircase in one of the towers, whence a magnificent view may be had of the valley of the Ugie. Ravenscraig stands on the opposite side of the river; it is built upon a rock, and is considered a good specimen of the ancient Scottish baronial style, in the square form so common in the beginning of the 13th century. Its walls are so strong as to have been deemed impregnable previous to the use of artillery. Pop. '91, 12,200.

PETERHOF, a palace of the emperor of Russia, on the southern shore of the gulf of Finland, 15 m. w. of St. Petersburg. The palace was built by Peter the Great in 1711, contains a fine collection of paintings, and is surrounded by a beautiful park. The town of Peterhof has 9,516 inhabitants.

PETERKIN, GEORGE WILLIAM, D.D., b. Md., 1841; studied at the univ. of Virginia, 1858–9; served in the Confederate army 1861–65; graduated at the theol. sem. of Virginia, 1868; and was ordained priest in the Prot. Epis. church, 1869. He was asst. minister at St. James' church, Richmond, Va.; and rector of St. Stephen's church, Culpepper, Va., and the Memorial church, Baltimore; and was consecrated bp. of W. Va., 1878.

PETERLOO MASSACRE, the name popularly given to the dispersal of a large meeting by armed force in St. Peter's field, Manchester, Monday, July 16, 1819. The assemblage, consisting chiefly of bodies of operatives from different parts of Lancashire, was called to consider the question of parliamentary reform, and the chair, on open hustings, was occupied by Mr. Henry Hunt. The dispersal took place by order of the magistrates; several troops of horse, including the Manchester yeomanry, being concerned in the affair, of which an account will be found in *History of the Peace*, by Harriet Martineau, edition of 1858, p. 107. Five or six persons were killed and many wounded. St. Peter's field is now covered by buildings. Peterloo was a fanciful term, suggested by Waterloo.

PETERMANN, AUGUST, 1822–78; b. Prussian Saxony; educated at Nordhauser for the church, but developed a decided taste for geography, went to Potsdam in 1839, remained there 6 years and became the private secretary and librarian of Prof. Berghaus, the founder of the academy. In 1841 he drew the illustrated map for baron Humboldt's *Central Asia;* in 1845 went to Edinburgh as assistant to Mr. A. K. Johnston in his *Physical Atlas* based upon Berghaus's *Physical Geography*, on which he had worked. In 1847 he was associated with the Rev. Thomas Milner in publishing an *Atlas of Physical Geography;* went to London and became a member of the royal geographical society. He was author of an *Account of the Expedition to Central Africa*. He contributed to the *Encyclopædia Britannica*, and to the geographical division of the *English Cyclopædia*. In 1854 he was appointed professor of geography at Gotha by the duke of Saxe-Coburg-Gotha. He was for some years employed as superintendent of Justus Perthes's establishment, preparing maps; and edited a monthly journal, *Mittheilungen*, devoted to modern discoveries in geography. He contributed some of the best maps, including one of the United States in 6 parts, for the late edition of Stieler's *Hand-Atlas*, visiting the United States in 1876.

PETERMANN, JULIUS HEINRICH, 1801–76; b. Germany; educated at Leipsic and Berlin, studied Armenian at Venice, and in 1837 was called to the chair of oriental literature at Berlin. He was German consul at Jerusalem 1867–68. He published grammars of the Hebrew, Chaldaic, Armenian, and Arabic languages, and a number of works relating to oriental literature.

PETER-PENCE, the name given to a tribute which was collected in several of the western kingdoms, and offered to the Roman pontiff, in reverence of the memory of St. Peter, whose successor that bishop is believed by Catholics to be. From an early period, the Roman see had been richly endowed; and although its first endowments were chiefly local, yet as early as the days of Gregory the Great, large estates were held by the Roman bishops in Campania, in Calabria, and even in the island of Sicily. The first idea, however, of an annual tribute appears to have come from England. It is ascribed by some to Ina (721 A.D), king of the west Saxons, who went as a pilgrim to Rome, and there founded a hospice for Anglo-Saxon pilgrims, to be maintained by an annual contribution from England; by others, to Offa and Ethelwulf, at least in the sense of their having extended it to the entire of the Saxon territory. But this seems very uncertain; and although the usage was certainly anterior to the Norman conquest, Dr. Lingard is

disposed not to place it higher than the time of Alfred. The tribute consisted in the payment of a silver penny by every family possessing land or cattle of the yearly value of 30 pence, and it was collected during the five weeks between St. Peter's and St. Paul's day and Aug. 1. In the time of king John the total annual payment was £199, 8s., contributed by the several dioceses, in various proportions, which will be found in Lingard's *History of England*, vol. ii. p. 330. The tax, called Romescot, with some variation, continued to be paid till the reign of Henry VIII., when it was abolished. By Gregory VII. it was sought to establish it for France; and it appears also in Denmark, Sweden, Norway, and Poland. This tribute differs from the payments of the feudatory kingdoms, such as Naples, Aragon, and England under the reign of John.

The pope having suffered a considerable diminution of his own revenue since the revolution of 1848, an effort has been made in several parts of Europe to revive this tribute. In some countries it has been very successful, and the proceeds have been among the chief of the resources by which Pius IX. was so long enabled to meet the pressure of pecuniary embarrassments caused by his diminished territorial possessions. The average annual amount of this collection for the ten years, 1880–1890, was about $2,600,000. See POPE.

PETERS, ABSALOM, D.D., 1793–1869; b. N. H.; graduated at Dartmouth college in 1816, and Princeton theological seminary in 1819; was pastor of the Congregational church at Bennington, Vt., 1820–25; secretary of the American home missionary society until 1837; edited the *Home Missionary and Pastor's Journal;* edited the *American Biblical Repository;* professor of pastoral theology and homiletics in the Union theological seminary, New York, 1842–44; and pastor of the First church (Congregational), Williamstown, Mass., 1844–57; originated while there and edited the *American Eclectic*, and the *American Journal of Education.* He published *A Plea for Voluntary Societies; Sprinkling the only Mode of Baptism; Sermon against Horse-Racing; Sacred Music.* After he had passed his 70th year he published a volume of poems.

PETERS, CHRISTIAN HEINRICH FRIEDRICH, PH.D.; b. Germany, 1813; graduated at the university of Berlin, after which he traveled for several years making scientific investigations in Italy and the eastern countries. He went to the United States, and was employed by the government in making coast surveys. In 1858 he accepted the professorship of mathematics and astronomy at Hamilton college, and was director of the Litchfield astronomical observatory, where he made many valuable discoveries concerning comets and asteroids; he also determined the exact longitude of several points in the state, and of Ann Arbor, Mich., which was an essential point in the U. S. lake survey; also determined the western boundary of New York state. In the observation of the total solar eclipse, Aug. 7, 1869, he was at Des Moines, Iowa, and took a prominent part. Prof. P. discovered 22 asteroids, catalogued 16,000 zodiacal stars, and recorded more than 20,000 solar spots. He had charge of the party sent by the United States to New Zealand to observe the transit of Venus, Dec. 9, 1874, and his were the only successful observations made on that island. Professor Peters died in 1890.

PETERS, OR **PETER**, HUGH, 1599–1660; b. England; was ordained and preached at the church of St. Sepulchre, London, until he was silenced and imprisoned for non-conformity. When liberated he went to Rotterdam, and became pastor of the Independent church; was in New England from 1635 to 1641; was settled pastor of the First church in Salem, Mass., as successor of Roger Williams. In 1658 he was chaplain to the garrison at Dunkirk. After the restoration, being suspected of complicity in the king's death, he was committed to the Tower, indicted for high treason, condemned, and beheaded Oct. 16, 1660. During his imprisonment he wrote several letters of advice to his daughter, which were published in 1717 under the title of *A Dying Father's last Legacy to an only Child.* He published *Peters's last Report of the English Wars; A Word for the Army and Two Words for the Kingdom; A Good Work for a Good Magistrate.*

PETERS, JOHN CHARLES, b. N. Y., 1819; studied medicine in the medical department of Columbia college, and in Europe, and commenced practice in New York as a homeopathist, but afterwards became an allopathist. He was one of the first members of the New York pathological society; was president of the medical library and journal association; and published treatises on diseases of the head, diseases of females, diseases of the eyes, and Asiatic cholera. In connection with Dr. Wotherspoon, he translated Rokitansky's *Pathological Anatomy*, and with Dr. E. F. Snelling, and others, he published a *Materia Medica.* Dr. Peters was editor of the *North American Journal of Homeopathy*, and of the *Transactions* of the pathological society. He d. in 1893.

PETERS, KARL, a German traveler, was born Sept. 27, 1856, studied at Göttingen, Tübingen and Berlin, where he became professor in 1880. He founded the German Colonization Company, in whose interests he traveled through eastern Africa. Returning to Germany in 1885 he became the head of the German East Africa Company and two years later went again to Africa. In 1888 he took the leadership of an expedition for the relief of Emin Pasha, reached Zanzibar in Feb. 1889, and marched up the Tana river to its source and penetrated finally to Victoria Nyanza. Thence he crossed the lake to Usukuma and Mpwapwa and met Emin, after which he returned to the coast. He was sent as imperial commissioner to East Africa; founded a station at Kilima Njaro, and was active in the settlement of the boundary between German and English possessions. He has published *Willenswelt und Weltwille* (1883), a philosophical study; *Die deutsche Emin Pascha-Expedition* (1891); *Das Deutsche-Ostafrikanische Schutzgebiet* (1895); *Die goldene Ophir Salomos* (1895).

PETERS, Richard, 1744–1828; b. Blockley, Penn.; graduate of Philadelphia college; studied law, with great success at the outset. He had brilliant social qualities, wit, and conversational powers of a high order, speaking German fluently. In the revolutionary war he was capt. of a militia company, and secretary of the board of war from June, 1776, to Dec., 1781; judge of the U. S. district court of Pennsylvania from 1789 to his death. In 1797 he published an account of some experiments by which he had ascertained the value of the use of gypsum in agriculture, thus introducing it to the farmers of the country. He contributed valuable articles to the Philadelphia agricultural society, of which he at one time was president. In 1780–1807 he published *Admiralty Decisions in the U. S. District Court of Pennsylvania*, 2 vols. His son, Richard, jr., was successor of Henry Wheaton as reporter of the U. S. superior court, and has published numerous condensed reports of the U. S. superior and circuit courts, *Case of the Cherokee Nation against the State of Georgia;* also editor of *Chitty on Bills;* and Washington's *Circuit Court Reports*, 3d *Circuit* (1803–27), 4 vols.

PETERS, Samuel, d.d., ll.d., 1735–1826; b. Hebron, Conn.; graduate of Yale college, 1757. In 1758 he went abroad for a year. Returning to Connecticut in 1759, he became a clergyman of the Episcopal church, and was placed in charge of the churches of Hebron and Hartford. He was a tory, so pronounced in his loyalty that he was forced to take flight to England, where, in 1781, he seems to have revenged himself by publishing a *General History of Connecticut*, absurdly untruthful—among other misrepresentations, setting forth a code of "blue laws," which had no existence. In 1794 he was chosen (but never consecrated) bishop of Vermont. In 1805 he came to New York, and published, 1807, a *History of Rev. Hugh Peters*, his great-uncle; and a history of Hebron. In 1817 he visited the falls of St. Anthony, taking up a claim there of a large extent of country. He is the original of the "Parson Peter" in Trumbull's *M'Fingal.*

PETERS, Wilhelm Karl Hartwig, 1815–83; b. Coldenbuttel, Schleswig. He became known as a naturalist first by his exploration of Mozambique, 1842, under the auspices of the Prussian government. He described his exploration in a work of 4 vols., 1852–68. From this work Bleek compiled his *Languages of Mozambique.* For many years he was connected with the medical dept. of the univ. of Berlin, and became prof. of zoology and director of the zoological collections, 1857.

PETERSBURG, a city at the junction of Chesterfield, Dinwiddie, and Prince George cos., Va.; independent of co. authority; on the Appomattox river, the Upper Appomattox canal, and the Norfolk and Western and Atlantic Coast Line railroads; 22 m. s. of Richmond. It was founded in 1733; incorporated as a town in 1748; and chartered as a city in 1850. Large water power for manufacturing and milling is provided by the canal. The city contains the central state hospital for the insane, home for the sick, mechanics' association library, two public parks, Blandford cemetery, many points of interest connected with the civil war, electric light and street railroad plants, national and state banks, and manufactories of tobacco, flour and cotton goods. It has a large export tobacco trade. In June, 1864, Lieutenant-General Grant, with an army of about 100,000 men, was at City Point, at the junction of the James and Appomattox, and Lee, crossing the Chickahominy, had taken up a position protecting Richmond from attack on the n. and e. banks of the James. The federal forces assaulted Petersburg, June 15–18, but were repulsed with a loss of over 10,000 men. The siege of Petersburg began June 19. Mines were exploded, and a number of unsuccessful attempts made to take the city by storm, till, after a week's bombardment, Gen. Lee evacuated it, April 2, 1865. Pop. '90, 22,680.

PE'TERSEN, Clemens, b. Denmark, 1834; educated at the Copenhagen university, where he took a course of study in philosophy and theology, and from 1853–69 was connected with a Danish paper as critic. In 1869 he came to the United States, settled in New York, contributed to many papers and periodicals, and was engaged in editorial work in the preparation of Johnson's *Cyclopedia.*

PE'TERSFIELD, a parish and market t. in Hampshire, 16½ m. n.e. by e. of Portsmouth and on the London and Southwestern railway. It is a pleasant country town, and contains a Norman parish chapel of the 12th c., and an educational institution called Churcher's college. An equestrian statue of William III. once richly gilt, stands in the market-place. Petersfield returned a member to the house of commons until 1885. Pop. '91, 2002.

PETER'S PENCE. See Peter-Pence.

PETER THE GREAT BAY, an inlet 100 m. wide, running 50 m. inland on the coast of Russian Manchuria, and extending from the Korean frontier to Cape Povorotnyi.

PETERWAR'DEIN, a t. in the Austrian province of Croatia and Slavonia, and one of the strongest fortresses in the Austrian dominions, is situated on the right bank of the Danube, opposite Neusatz. The ordinary garrison is a very strong one, and besides it, the town and suburbs contain a population of, '90, 3,777. The most ancient part of the fortifications, the upper fortress, is situated on a rock which on three sides rises abruptly from the plain. Peterwardein is situated on a narrow peninsula, and is named in honor of Peter the hermit. In 1688 the fortifications were blown up by the imperialists, and the town was soon after burned to the ground by the Turks; but at the peace of Passarowitz, on July 21, 1718, it remained in the possession of the emperor.

It was here, that on Aug. 5, 1716, prince Eugene obtained a great victory over the grand vizier Ali. In 1749 the town capitulated to the Austrians.

PETH'ERICK, JOHN, b. England; went to Egypt, 1845, engaged in mining, attached himself to the service of Mehemet Ali, and in 1847 was sent to Kordofan. He passed several years in the region of the upper Nile, and retired from the service on the death of Mehemet Ali to accept the position of British consul at Khartoum, engaging in mercantile pursuits. In 1859 he went to England. He published, 1861, *Egypt, the Soudan, and Central Africa, with Explorations from Khartoom on the White Nile to the Regions of the Equator.*

PETIC', or PITIC, now called Hermosillo, a t. in the state of Sonora, Mex., on the lower part of the river of the same name; pop. '89, 7,071. Its port, Guaymas, is reached by the Southern Pacific railway. It contains the capital, court house, theater, etc. From it are shipped large quantities of wine, wheat, and fruit, the products of the fertile and thickly-populated valley at the entrance to which it is situated.

PETIGRU, JAMES LOUIS, 1789–1863; b. S. C.; of Huguenot and Irish descent; educated in the state college, and after graduating in 1809 studied law and practiced in Abbeville and Charleston. From 1822 to 1830 he was the attorney-general of South Carolina. From the time when Calhoun enunciated his doctrine of nullification (q.v.) until Mr. Petigru's death, he was in a position of opposition to the general sentiment of the community in which he lived, as he was an uncompromising antagonist of both nullification and secession. Though incurring personal odium for this cause, his personal character and professional ability maintained him in the position of the foremost lawyer at the state bar. Before the war he was U. S. district attorney for a short time, was a member of the legislature, and in 1861 took part in codifying the state statutes, and was president of the South Carolina historical society.

PE'TIOLE. See LEAVES.

PÉTION, ANNE ALEXANDRE SABÉS, 1770–1818; b. Port-au-Prince; first president of the republic of Hayti; educated at a military school in France. In the revolution in St. Domingo he was first made an artillery officer, then raised to the rank of adjt.gen. He was associated with Rigaud in opposition to Toussaint L'Ouverture; but failed in his projects and set out for France, returning with a col.'s commission under Gen. Leclerc. Not coinciding with the violent measures of Leclerc or Rochambeau, he left their service, and joining himself to Dessalines drove the French from those shores. In 1804, with the help of the English, they established the independence of Hayti. He was made governor of the western district, embracing Port-au-Prince, Dessalines being chief. His election as president, Jan. 27, 1807, was disputed by Christophe, occasioning a civil war, but he retained his office till death.

PÉTION DE VILLENEUVE, JÉROME, noted for the part he played in the first French revolution, was the son of a procurator at Chartres, and was born there in 1753. He was practicing as an advocate in his native city when he was elected in 1789 a deputy of the *tiers état* to the states-general. His out-and-out republican principles, and his facile oratory, sonorous rather than eloquent, quickly made him popular, though he had an essentially mediocre understanding, and was altogether a windy, verbose personage. He was a prominent member of the Jacobin club, and a great ally of Robespierre; the latter was called the "incorruptible," and Pétion de Villeneuve the "virtuous." He was sent along with Barnave and Latour-Maubourg to bring back the fugitive royal family from Varennes, and in the execution of this commission he acted in an extremely unfeeling manner. He afterward advocated the deposition of the king and the appointment of a popularly-elected regency, and along with Robespierre received, Sept. 30, 1791, the honors of a public triumph. On Nov. 18, he was elected *maire de Paris* in Bailly's stead, the court favoring his election, to prevent that of Lafayette. In this capacity he encouraged the demonstrations of the lowest classes and the arming of the populace. But as the catastrophe drew near he awoke to a sense of its terrible nature, and sought in vain to arrest the torrent. On the triumph of the terrorists, Pétion de Villeneuve's popularity declined, and he joined the Girondists. On the king's trial he voted for death, but with delay of execution and appeal to the people, upon which he became suspected of being a royalist, and of partaking in the treason of Dumouriez. He was thrown into prison, June 2, 1793, on the fall of the Gironde, but escaped from prison and joined the other Girondists at Caen. Upon the defeat of their army by that of the convention, he fled, in July, 1793, into Bretagne, and in company with Buzot reached the neighborhood of Bordeaux, which, however, had already submitted. A short time after, Pétion de Villeneuve's and Buzot's corpses were found in a corn field near St. Emilion, partly devoured by wolves. They were supposed to have died by their own hands. Pétion de Villeneuve's character has been defended by Mme. de Genlis and Mme. Roland. It appears that he was extremely virtuous in all his domestic relations; but, on the other hand, his public career shows him to have been weak, shallow, ostentatious, and vain. *Les Œuvres de Pétion*, containing his speeches, and some small political treatises, were published in 1793.

PETI'TIO PRINCIP'II ("a begging of the principle or question") is the name given in logic to that species of vicious reasoning in which the proposition to be proved is assumed in the premises of the syllogism.

PETITION (Lat. *peto*, I ask), a supplication preferred to one capable of granting it. The right of the British subject to petition the sovereign or either house of parliament for the redress of grievances is a fundamental principle of the British constitution, and has been exercised from very early times. The earliest petitions were generally for the redress of private wrongs, and the mode of trying them was judicial rather than legislative. Receivers and triers of petitions were appointed, and proclamation was made inviting all persons to resort to the receivers. The receivers, who were clerks or masters in chancery, transmitted the petitions to the triers, who were committees of prelates, peers, and judges, who examined into the alleged wrong, sometimes leaving the matter to the remedy of the ordinary courts, and sometimes transmitting the petition to the chancellor or the judges, or, if the common law afforded no redress, to parliament. Receivers and triers of petitions are still appointed by the house of lords at the opening of every parliament, though their functions have long since been transferred to parliament itself. The earlier petitions were generally addressed to the house of lords; the practice of petitioning the house of commons first became frequent in the reign of Henry IV.

Since the revolution of 1688, the practice has been gradually introduced of petitioning parliament, not so much for the redress of specific grievances as regarding general questions of public policy. Petitions must be in proper form and respectful in language; and there are cases where petitions to the house of commons will only be received if recommended by the crown, as where an advance of public money, the relinquishment of debts due to the crown, the remission of duties payable by any person, or a charge on the revenues of India have been prayed for. The same is the case with petitions praying for compensation for losses out of the public funds. A petition must, in ordinary cases, be presented by a member of the house to which it is addressed; but petitions from the corporation of London may be presented by the sheriffs or lord mayor. Petitions from the corporation of Dublin have also been allowed to be presented by the lord mayor of that city, and it is believed that a similar privilege would be acceded to the lord provost of Edinburgh.

The practice of the house of lords is to allow a petition to be made the subject of a debate when it is presented; and unless a debate has arisen on it, no public record is kept of its substance, or the parties by whom it is signed. In the house of commons, petitions not relating to matters of urgency are referred to the committee on public petitions, and in certain cases ordered to be printed.

The constitution of the United States, like that of Great Britain, guarantees to every citizen the right of petition for a redress of grievances.

PETITION OF RIGHTS, a declaration of certain rights and privileges of the subject obtained from king Charles I. in his third parliament. It was so called because the commons stated their grievances in the form of a petition, refusing to accord the supplies till its prayer was granted. The petition professes to be a mere corroboration and explanation of the ancient constitution of the kingdom; and after reciting various statutes, recognizing the rights contended for, prays "that no man be compelled to make or yield any gift, loan, benevolence, tax, or such like charge, without common consent by act of parliament; that none be called upon to make answer for refusal so to do; that freemen be imprisoned or detained only by the law of the land, or by due process of law, and not by the king's special command, without any charge; that persons be not compelled to receive soldiers and mariners into their houses against the laws and customs of the realm; that commissions for proceeding by martial law be revoked." The king at first eluded the petition, expressing in general terms his wish that right should be done according to the laws, and that his subjects should have no reason to complain of wrongs or oppressions; but at length, on both houses of parliament insisting on a fuller answer, he gave an unqualified assent on June 26, 1628.

PETITOT, Louis Messidor Lebon, 1794–1862; b. Paris; son of Pierre, with whom he studied the art of sculpture, subsequently attending the school of fine arts in his native city, won the prize, 1814, and went to Rome. In 1820 he returned to Paris. In 1821 he produced "Ulysses Visiting Alcinous;" 1822, "St. John the Baptist;" 1824, "A Young Sportsman Bitten by a Serpent;" 1847, "A Calabrese Pilgrim and his Son Imploring the Aid of the Virgin," which was given a conspicuous position in the garden of the Luxembourg.

PETIT PARIS. (Little Paris). A name often given to the city of Brussels (q.v.).

PE'TO, Sir Samuel Morton, b. England, 1809; was apprenticed to his uncle, a builder, at whose death, in 1830, he succeeded to a half interest in the business, in partnership with another. In 1845 he retired from the firm, and conducted the building of railroads on his own account, constructing a large portion of the leading railway works in England. He built the Norwegian Grand Trunk line and the Royal Danish line in 1854; receiving for the latter service, and as a testimonial to his ability, the order of Darmebrog, presented to him by the king of Denmark. He constructed, without pros-

pect of profit, the railway from Balaklava, during the Crimean war; and, in recognition of this patriotic service, received a patent of baronetcy, Feb. 22, 1855. He built two chapels in London, for the Baptist denomination, at his own expense. He entered parliament in the liberal interest in 1847; was re-elected in 1852; and retired in 1854. In 1859 he was again elected; and again in 1865; but retired finally in 1868, on account of the bankruptcy of the firm of Peto, Betts and Crampton, with liabilities amounting to more than £7,000,000. He wrote *Taxation, its Levy and Expenditure;* and *Resources and Prospects of America,* having visited the latter country, and examined its railroad system and industries. He also constructed one of the Canadian railways. He d. in 1889.

PETÖFI, SANDOR (ALEXANDER), who may fairly be described as the national poet of Hungary, was born at Little Körös, in the county of Pesth, Jan. 1, 1823. His father was a butcher, and a small landowner in Little Kumania, and bore the name of Petrovich (son of Peter)—a name indicating a Slavonic origin, which the poet, when he came to manhood, exchanged for the Magyar equivalent, Petöfi. In 1838 his father was reduced to poverty by an overflowing of the Danube, which destroyed his little estate; and it was by the help of relatives that he was able to carry out his design of educating his son for a profession. Petöfi was sent to the lyceum of the town of Schemnitz. It was while there that he began to write verses, and first displayed the extravagant fondness for theatricals which characterized him throughout life. From the first he neglected his studies; ultimately, he ran away with a band of German strollers. His father after some time found him out, and brought him home, and he remained for a period in quasi-custody among his relatives. When at length he was again sent to school at Oedenburg, he almost immediately ran away, and enlisted as a common soldier. After he had been about two years in the army, a physician, who had taken pity upon him, procured his discharge, and he went back to his relations. He afterwards went to Pápá, to complete his education. His passion for the stage, however, drew him away from Pápá, as it had formerly done from Schemnitz; in 1842 he left it to join a troop of comedians. His stage attempts were utter failures, and he soon parted from the comedians, if, indeed, he was not dismissed by them. He made his way to Presburg, and afterward to Pesth, where he got some employment as a translator from the English and the French. Among other works, he translated a novel by Mr. G. P. R. James. As soon as his literary labor supplied him with the means of traveling, his passion for the stage returned upon him; he went to Debreczin, and made another venture as an actor—playing the part of Othello—but failed even more completely than before. At last he had the good fortune to be invited to contribute to a newspaper at Pesth—the *Devallap*—and he immediately closed with the proposal. He made his way on foot from Debreczin to Pesth—a distance of nearly 200 m.—wearing shoes padded with straw, and carrying in his bosom a MS. volume of verses, his whole provision for the journey consisting of two florins, which he got from an old school-fellow. It was on his arrival at Pesth that he exchanged the name of Petrovich for Petöfi. Within a few weeks of his arrival he had troops of friends and a reputation.

He introduced himself to Vörösmarti, then the most popular poet of Hungary, who received the shabbily-dressed stranger coldly, and did not readily consent to listen to his verses. But when he had listened, he expressed his admiration warmly, "Hungary," he exclaimed, "never had such lyrics: you must be cared for." And from that time he treated Petöfi as a son, and never rested until his merits were fully acknowledged by his countrymen. Petöfi was almost at once received into the literary national circle, at the expense of which was published his *Versek*, which appeared in 1844. This was soon followed by other volumes, which succeeded each other with amazing rapidity; all of them, though regarded as vulgar by some of the critics, obtaining an unbounded popularity; so that it was said of Petöfi that "he never went to bed at night, he never arose in the morning, without hearing his songs from the multitudinous passengers in the public streets." He sprang almost at a bound into a position in Hungary similar to that which Burns held in Scotland—that at once of the greatest poet and the representative man of his country. In 1848, when the revolutionary movement which spread over Europe began to affect the Hungarians, his energies and enthusiasm found a more useful direction; he became, by speech and pen, the advocate of the independence of Hungary. He was for some time a member of the diet, but in Oct., 1848, he became a capt. in the Hungarian army; and in the beginning of 1849 he was appointed adjutant and secretary to gen. Bem. He was present at the battle of Schässburg, fought on July 31, 1849, in which Bem's army was defeated with great slaughter; and he was never heard of after that battle. It is believed that he was trampled to death in the flight, and that his body, so defaced as to escape recognition, was buried with the multitude of Magyar dead left upon the field. His countrymen long believed that he was not dead, but a prisoner in an Austrian dungeon; and it is said that among the peasantry this belief is cherished still. Several false Petöfis have made their appearance since his death, and much spurious poetry has been published under his name. Lately, however, his countrymen have subscribed for the erection of a monument to his memory, and have purchased, with a view to its preservation, the house in which he was born at Little Körös. He left a widow—who married again—and one son. His brother, STEPHEN, has gained some reputation as a poet.

His poems, 1775 in number, were published in 10 volumes. Most of them are lyrics, of which he published several collections, under the titles, *Cypress Leaves on Etelka's Grave; Pearls of Love; Starless Nights; Clouds.* The most celebrated of his narrative poems—also the longest—are, *Janos, the Hero; Istok, the Fool.* His earliest work was *The Wine-drinkers*, published in 1842; his latest, *The Assessor of the Judgment-seat*, which appeared in 1849. A volume, containing a poem entitled *The Apostle*, was suppressed by the Austrian government after the pacification of Hungary. Petöfi published a novel, *The Hangman's Rope*, which was by no means successful, and several volumes of tales, criticisms, and sketches of travel; and he translated largely from English and French into the Magyar.

A selection from his earlier pieces, translated into German, was published in 1845; and several volumes of translations from his writings have since appeared in Germany. They have also been translated into French, Flemish, Polish, Danish, and Italian; and an English version, comprising his finest poems, was published in 1866 by sir John Bowring. The quality of his poetry has been as fully recognized among foreigners as among his countrymen; thus, Grimm declared that "Petöfi will rank among the very greatest poets of all times and tongues;" Heinrich Heine spoke rapturously of his "rustic song, sweeter than that of the nightingale;" and Uhland avowed that only old age could prevent his learning Magyar, that he might enjoy Petöfi in his native dress.

PE'TRA (Heb. SELA, both names signify "rock") was anciently the capital of the Nabathæans, and was situated in the "desert of Edom" in northern Arabia, about 72 m. n.e. of Akabah—a town at the head of the gulf of Akabah, an arm of the Red sea. It occupied a narrow rocky valley overhung by mountains, the highest and most celebrated of which is mount Hor, where Aaron, the first Hebrew high-priest, died, and was thus in the very heart of the region hallowed by the forty years' wanderings of the Israelites. The aboriginal inhabitants were called *Horim* ("dwellers in caves"). It was then conquered by the Edomites or Idumeans (but it never became their capital); and, in the 3d or 4th c. B.C., it fell into the hands of the Nabathæans, an Arab tribe, who carried on a great transit trade between the eastern and western parts of the world. It was finally subdued by the Romans in 105 A.D., and afterwards became the seat of a metropolitan; but was destroyed by the Mohammedans, and for 1200 years its very site remained unknown to Europeans. In 1812 Burckhardt first entered the valley of ruins, and suggested that they were the remains of ancient Petra. Six years later it was visited by Messrs. Irby, Mangles, Banks, and Leigh, and in 1828 by M.M. Laborde and Linant, and since then by numerous travelers and tourists to the east, as Bartlett, Porter, and dean Stanley. Laborde's drawings give us a more vivid impression of the ruins of Petra than any descriptions, however picturesque. These ruins stand in a small open irregular basin, about half a mile square, through which runs a brook, and are best approached by an extraordinary chasm or ravine, called the Sîk, narrowing as it proceeds till in some places the width is only 12 ft., while the rocky walls of red sandstone tower to the height of 300 feet. Hardly a ray of light can pierce this gloomy gorge, yet it was once the highway to Petra, and the remains of an ancient pavement can be traced beneath the brilliant oleanders that now cover the pathway. All along the face of the rocky walls are rows of cave-tombs, hewn out of the solid stone, and ornamented with façades. These are also numerous elsewhere. Originally, they were probably dwellings of the living, not of the dead—a supposition justified by an examination of their interior; but when the Nabathæans built the city proper in the little basin of the hills, they were in all likelihood abandoned, and then set apart as the family sepulchers of those who had formerly been "dwellers in the clefts of the rocks." The principal ruins are: 1. *L-Khuzneh* ("the Treasure-house"), believed by the natives to contain, buried somewhere in its sacred inclosure, the treasures of Pharaoh. It directly faces the mouth of the gorge we have described, and was the great temple of the Petræans. 2. *The Theater*, a magnificent building, capable of containing from 3,000 to 4,000 spectators. 3. *The Tomb with the Triple Range of Columns.* 4. *The Tomb with Latin Inscription.* 5. *The Deer* or *Convent*, a huge monolithic temple, hewn out of the side of a cliff, and facing mount Hor. 6. *The Acropolis.* 7. *Kusr Farôn*, or Pharaoh's palace, the least incomplete ruin of Petra. Most of the architecture is Greek, but there are also examples of the influence of Egypt, pyramidal forms being not unknown.

PETRARCA, FRANCESCO, the first and greatest lyric poet of Italy, was the son of a Florentine notary named Petracco, who belonged to the same political faction as the poet Dante, and went into exile along with him and others in 1302. Petracco took up his residence at Arezzo, and here the future poet was born in the month of July, 1304. His original name was Francesco di Petracco, which he subsequently changed to that by which he is now known. When Petrarca was about eight years of age, his father removed to Avignon, where the papal court was then held; and here, and at the neighboring town of Carpentras, the youth studied grammar, rhetoric, and dialectics. Contrary to his own inclination, but in compliance with the wish of his father, he spent seven years in the study of law at Montpellier and Bologna; but in 1326 his father died, and Petrarca now devoted himself partly to the gayeties of Avignon, and partly to classical studies, or rather to the study of the Latin classics, as it was only towards the end of his life that he attempted to master Greek. At this time he ranked among his friends, the

jurist Soranzo, John of Florence, the apostolic secretary, Jacopo Colonna, bishop of Lombes, in Gascony, and his brother, the cardinal Giovanni Azzo da Corregio, lord of Parma, and many other noble and learned personages. His illustrious admirers—among whom were emperors, popes, doges, kings, and sovereign dukes—obviously thought themselves honored by their intimacy with the son of a poor notary, and some were even forward in proffering him their favor. But the great event in Petrarca's life (viewed in the light of its literary consequences) was his tenderly romantic and ultimately pure passion for Laura—the golden-haired, beautiful Frenchwoman. Some slight obscurity still hangs over his relation to this lady, but it is almost certain that she was no less a paragon of virtue than of loveliness. He met her on April 6, 1327, in the church of St. Clara in Avignon, and at once and for ever fell deeply in love with her. The lady was then 19, and had been married for two years to a gentleman of Avignon, named Hugues de Sade. For ten years Petrarca lived near her in the papal city, and frequently met her at church, in society, at festivities, etc. He sung her beauty and his love in those sonnets whose mellifluous conceits ravished the ears of his contemporaries, and have not yet ceased to charm. Laura was not insensible to a worship, which made an emperor (Charles IV.) beg to be introduced to her, and to be allowed to kiss her forehead; but she seems to have kept the too-passionate poet at a proper distance. Only once did he dare to make an avowal of his love in her presence, and then he was sternly reproved. In 1338, Petrarca withdrew from Avignon to the romantic valley of Vaucluse, where he lived for some years, spending his time almost solely in literary pursuits. A most brilliant honor awaited him at Rome, in 1341, where, on Easter day, he was crowned in the capitol with the laurel-wreath of the poet. The ceremonies which marked this coronation were a grotesque medley of pagan and Christian representations. Petrarca was, however, as ardent a scholar as he was a poet; and throughout his whole life, he was occupied in the collection of Latin MSS., even copying some with his own hand. To obtain these, he traveled frequently throughout France, Germany, Italy, and Spain. His own Latin works were the first in modern times in which the language was classically written. The principal are his *Epistolæ*, consisting of letters to his numerous friends and acquaintances, and which rank as the best of his prose works; *De Vitis Virorum Illustrium; De Remediis utriusque Fortunæ; De Vita Solitaria; Rerum Memorandarum Libri IV.; De Contemptu Mundi*, etc. Besides his prose epistles, Petrarca wrote numerous epistles in Latin verse, eclogues, and an epic poem called *Africa*, on the subject of the second Punic war. It was this last production which obtained for him the laurel-wreath at Rome. Petrarca, it may be mentioned, displayed little solicitude about the fate of his beautiful Italian verse, but built his hope of his name being remembered on his Latin poems, which, it has been said, are now only remembered by his name. In 1353 he finally left Avignon, and passed the remainder of his life in Italy—partly at Milan, where he spent nearly ten years, and partly at Parma, Mantua, Padua, Verona, Venice, and Rome. At last, in 1370, he removed to Arquà, a little village prettily situated among the Euganean hills, where he spent his closing years in hard scholarly work, much annoyed by visitors, troubled with epileptic fits, not over rich, but serene in heart, and displaying in his life and correspondence a rational and beautiful piety. He was found dead in his library on the morning of July 18, 1374, his head dropped on a book!—Petrarca was not only far beyond his age in learning, but had risen above many of its prejudices and superstitions. He despised astrology, and the childish medicine of his times; but, on the other hand, he had no liking for the conceited skepticism of the mediæval *savants;* and, in his *De sui Ipsius et Multorum Aliorum Ignorantia*, he sharply attacked the irreligious speculations of those who had acquired a shallow free-thinking habit from the study of the Arabico-Aristotelian school of writers, such as Averrhoes. Petrarca became an ecclesiastic, but was contented with one or two inconsiderable benefices, and refused all offers of higher ecclesiastical appointment.—The Italian lyrics of Petrarca—the chief of which are the *Rime*, or *Canzoniere*, in honor of Laura—have done far more to perpetuate his fame than all his other works. Of Italian prose, he has not left a line. The *Rime*, consisting of sonnets, canzonets, madrigals, were composed during a period of more than forty years; and the later ones —in which Petrarca's love for Laura, long since laid in her grave, appears purified from all earthly taint, and beautiful with something of a beatific grace—have done as much to refine the Italian language as the *Divina Commedia* of Dante. Of his *Rime* there have been probably more than 300 editions; the first that of Venice, 1470; the most accurate, that by Marsand (Padua, 1819; Eng. trans. by Macgregor, 1851). Collective editions of his works have been published (Basel, 1495, 1554, and 1581 *et seq.*). Of numerous lives of him the principal are those of Bellutello, De Sades, Tiraboschi, Ugo Foscolo, and Geiger (1874); in Eng., Campbell (1841); Reeve in *Modern Classics for English Readers* (1878).

PETREL, *Procellaria*, a genus of birds, sometimes ranked among *laridæ* (q.v.), and sometimes constituted into a separate family, *procellaridæ*, which is now subdivided into several genera, and distinguished by having the bill hooked at the tip, the extremity of the upper mandible being a hard nail, which appears as if it were articulated to the rest, the nostrils united into a tube which lies along the back of the upper mandible, and the hind toe merely rudimentary. They possess great power of wing, and are among

the most strictly oceanic of birds, being often seen at great distances from land. Among the *Procellaridæ* are reckoned the fulmars (q.v.), shearwaters (q.v.), etc., and the small birds designated PETRELS, of which the stormy petrel is a familiar example. These form the genus *Thalassidroma* of recent ornithological systems, the name (Gr. sea-runner) being given to them in allusion to their apparent running along the surface of the waves, which they do in a remarkable manner, and with great rapidity, particularly when the sea is stormy, and the mollusks and other animals forming their food are brought in abundance to the surface—now descending into the very depth of the hollow between two waves, now touching their highest foamy crests, and flitting about with perfect safety and apparent delight. Hence also their name petrel, a diminutive of Peter, from the apostle Peter's walking on the water. From the frequency with which flocks of these birds are seen in stormy weather, or as heralds of a storm, they are very unfavorably regarded by sailors. They have very long and pointed wings, passing beyond the point of the tail; and the tail is square in some; slightly forked in others. Their flight much resembles that of a swallow. They are to be seen in the seas of all parts of the world, but are more abundant in the southern than in the northern hemisphere. The names stormy petrel and Mother Carey's chicken are sometimes more particularly appropriated to *thalassidroma pelagica*, a bird scarcely larger than a lark, and the smallest web-footed bird known, of a sooty black color, with a little white on the wings and some near the tail. Two or three other species are occasionally found on the British shores; one of which, the fulmar petrel, breeds on the rock of the Scilly Isles, St. Kilda, the Orkneys, Shetland Isles, etc. Like many others of the family, it generally has a quantity of oil in its stomach, which, when wounded or seized, it discharges by the mouth or nostrils; and of this the people of St. Kilda take advantage, by seizing the birds during incubation, and collecting the oil in a vessel. See illus., LARKS, ETC., Vol. VIII.

PETRIE, GEORGE, LL.D., 1791–1866; b. Dublin; son of a portrait painter; studied painting in his native city, winning a prize at the age of 14. In 1816 he was permitted to place his pictures on exhibition at Somerset house, London, and was then called a skillful draughtsman. He furnished sketches of noted places in Ireland for the engravers; in 1832 was one of the editors of the *Dublin Penny Journal* (illustrated), and ten years later edited the *Irish Penny Journal* with illustrations. He gained an intimate knowledge of the archæology of Ireland, and purchased curious and rare manuscripts for the Royal Irish academy. He collected over 400 vols. of letters and documents while conducting the antiquarian and historical department of the *Ordnance Memoir;* 1 vol. was published 1839, the rest failed to appear.

PETRIE, WILLIAM MATTHEW FLINDERS, archæological explorer, was born in England in 1853. In 1875 he began, after a long course of private study, the surveys which made him one of the most celebrated of modern archæologists. In 1880 he investigated the Egyptian pyramids at Ghizeh; in 1884 he excavated the great temple at Tanis; in 1885 he discovered and explored Naucratis, and in 1886, Nebesheh and Daphnæ; in 1887, Dahshur; in 1888, Hawara; and in 1889 and 1890, he opened up the ruins of Gurob, Kahun, and Lachish. In 1891 he published *Ilahun, Kahun, and Gurob.* He became Edwards professor of Egyptology at University college, London, and a member of the council of the Royal archæological institute. His late works include *Egyptian Decorative Art* and *Egyptian Tales* (both 1895), and vol. ii. of his *History of Egypt* (1896). During his explorations he discovered a number of valuable Greek papyri. A popular account of his work will be found in Miss Edwards's book, *Pharaohs, Fellahs, and Explorers* (N. Y. 1892).

PETRIFACTION, a name given to organic remains found in the strata of the earth, because they are generally more or less mineralized or made into stone. The word has fallen very much into disuse, having given place to the terms fossil (q. v.).

PETRIFIED FORESTS. Near Holbrook, Arizona, are found in great abundance trees that have undergone siliceous petrifaction; 20 or 30 varieties, mostly palms, have been recognized. One of these petrified trees spans a chasm 100 ft. wide. Many perfect specimens are found 2 ft. in diameter. The Peabody Museum, in New Haven, has one. The coloring is very beautiful, and under the microscope the woody structure is clearly seen.

PETROGRAPHY. See GEOLOGY.

PETROI'CA, a genus of birds of the family *sylviadæ*, natives of Australia, nearly allied to the redbreast, and to which its familiar name *robin* has been given by the colonists. The song, call-note, and manners of *P. multicolor*, a species abundant in all the southern parts of Australia, very much resemble those of the European bird, but its plumage is very different: the male having the head, throat, and back jet-black.

PETROLEUM is a natural rock-oil, composed principally of hydro-carbons, with bituminous elements, and essential oils. Long known in various parts of the world by its components appearing, either as bituminous springs on the surface, or floating on

water, as naphtha. See BITUMEN, and NAPHTHA. It is, in fact, a product of natural distillation in the formation of coal-measures, and occurs as a saturative with shales, clays and coals. Prof. Newberry long ago asserted that this was the case with the grahamite of Virginia, destined to be largely used as an asphalt in street paving in this country. Similar, probably, are the asphalts of Trinidad and the Jura. See ASPHALT. Factories were established for manufacturing burning fluid from imported bog coal as early as 1854, but in 1858 the sinking of the first well changed them all to refineries. In this country the great supply of petroleum, and at present the market for the world, is in n.w. Pennsylvania, in two districts, an upper and lower. There are also districts, for as a rule, petroleum-wells are confined to an area which is always limited and well-defined, in Ohio, West Virginia, and a large, but not profitable, area in California. Petroleum wells are sunk much as artesian wells (which see), necessitating the erection of large frames, derricks, and the necessary machinery, etc., known as a "rig." A well may flow water, oil, or oil and water, depending upon the point struck in the internal reservoir. Flowing wells gradually diminish their delivery, and finally have to be pumped. Oil is found on any one of the different horizons above the Eocene, and therefore, varies in depth from over 2,000 to less than 200 feet. Three layers of sand, found at varying distances apart in the first 900 ft., serve as a mark of depth in the oil region. The oil is stored in enormous tanks, and thence transported to the refineries, to New York, the great center of export, or to the sea-board farther south. Pipe lines are now laid from the oil region to the principal refineries, and the receipts of the pipe-line companies for so many barrels in tank are negotiable like certificates of grain-delivery. Oil-cars have iron tanks upon them, and oil-barrels are very strongly made, and often serve as return freight for Italian and German ships engaged in the export of oil. Oil is refined in a still (see DISTILLATION) by applying heat, and cooling the worm. The first and highest products are the volatile oils. These are known under various names, and are used for portable or small local gas generators, air being allowed to mix in proper proportion with the material, and the vapor pumped or forced through tubes like common gas. See NAPHTHA. By applying artificial coolers a still more volatile product may be obtained. The last and heaviest products of distillation are the crude oils, dark and disagreeable in smell. They are sold at a low price, either to adulterate commercial petroleum, to be used as antiseptics, like coal-tar, or in extracting paraffine. See PARAFFINE. The medium products are the burning-fluids of commerce, known under an infinity of names, and more or less refined or adulterated. The best kerosene is simply the best "run" of benzine, most carefully treated. The product is filtered, by centrifugal, piston, or other filters, treated with ammonia or sulphuric acid, bleached, deodorized and relieved of the acid. The variety of appliances used in these processes is endless, but the work is accompanied by a noisome odor, and the production of several stinking and deleterious compounds, for which no efficient remedy has yet been discovered. From the heavier grades of middle oils and the finer crude oils, may be manufactured by careful treatment a superior article of machinery oil, now a very valuable export to England and the continent. The illuminating properties of all the products of petroleum depend upon their union in proper quantities with the air; the test of oils is their flashing point and their burning point, and varying as they do in different ratios, both should always be known. Stringent laws, based upon both these tests, can alone regulate traffic in such dangerous commodities. See KEROSENE; OIL-WELLS. The yield of petroleum, estimated twenty years before at about a million barrels, increased as shown by the following table:

	1890.	1879.	1878.
Number of bbls. of 42 gallons each,	21,486,406	16,036,000	13,750,000
Total exports	15,811,146	12,300,000	10,000,000
Home consumption or accumulation at sea-board	5,675,260	3,736,000	3,750,000

PETROLEUM V. NASBY (*pseud.*) See LOCKE, DAVID ROSS.

PETROL'OGY (Gr. science of rocks), a term recently introduced into geology to designate particular aspects of the study of rocks, apart from their organic contents. By some, it is confined to an examination of their structure and composition; by others it is extended to the study of rock-masses, their planes of division, their forms, their position and mutual relations, and other characters not bearing on the question of the geological time of their production. See GEOLOGY.

PETROMY'ZON. See LAMPREY.

PE'TRONEL, an ancient and clumsy description of pistol.

PETRONIUS, ARBITER C., a Roman voluptuary at the court of Nero, whose profligacy is said to have been of the most superb and elegant description. We know, however, very little about him. He was at one time pro-consul of Bithynia, was subsequently appointed consul, and is certified as having performed his official duties with energy and prudence. But his grand ambition was to shine as a court exquisite. He was a kind of Roman *Brummell*, and Nero thought as highly of him as did the prince regent of the famous Beau. He was intrusted by his imperial master and companion with the charge of the royal entertainments, and thus obtained (according to Tacitus), the title of *Arbiter Elegantiæ*. Nero would not venture to pronounce anything *comme il faut* until it had received

the approval of the oracle of Roman fashion. The influence which he thus acquired was the cause of his ruin. Tigellinus, another favorite of Nero, conceived a hatred of Petronius, brought false accusations against him, and succeeded in getting his whole household arrested. Petronius saw that his destruction was inevitable, and committed suicide (66 B.C.), but in languid and graceful style, such, he thought, as became his life. He opened some veins, but every now and then applied bandages to them, and thus stopped the flow of blood, so that he was for a while enabled to gossip gayly with his friends, and even to appear in the streets of Cumæ, before he died. We are told that he wrote, sealed, and dispatched to Nero, a few hours before his death, a paper containing an account of the tyrant's crimes and flagitious deeds. It has been generally supposed that Petronius is the author of a well-known work entitled, in the oldest MSS., *Petronii Arbitri Satyricon*, a series of fragments belonging apparently to a very extensive comic novel or romance (see NOVELS), the greater portion of which has perished, but there is really no satisfactory evidence to show whether or not he was so. It is probable, however, that the work belongs to the 1st c. A.D. The fragments exhibit a horrible picture of the depravity of the times; but there is no indication that the author disapproves of what he describes. The *editio princeps* of the fragments appeared at Venice in 1499; later editions are those of Burmann (Traj. ad. Rhen. 1709; 2d edit. Amst. 1743), and of Antonius (Leip., 1781) and Bücehler (Berlin, 1882). Sienkiewicz has described P. in his novel *Quo Vadis.*

PETROPAVLOVSK′, a t. of Asiatic Russia, in the province of Akmolinsk, on the river Irtish, 166 m. by rail w. of Omsk. Pop. 16,200. It is an important military station, and has a custom house. A large trade is carried on—Petropavlovsk is also the name of a small port of Russian Siberia, on the e. shore of Avatcha bay.

PETROVSK′, a t. of Russia, in the province of Saratov, 65 m. n.w. of Saratov, situated on the Medvyeditsa connected by rail with main line to Moscow. Pop. 16,100.

PETROZAVODSK′, an important mining-town in the n. of European Russia, capital of the government of Olonetz, stands on the western shore of lake Onega, 300 m. by water n.e. of St. Petersburg. A cannon-foundry was erected here in 1701 by Peter the Great, who himself had discovered the rich resources of this northern region in iron and copper ores. The town itself dates from the year 1703; and from that to the present time it has been the great center of the mining industry of the government. The Alexandrovsky arms-factory is specially deserving of notice. It was founded in 1774, and, besides other arms, it has produced many thousand pieces of cast-iron ordnance. Works are also fitted up for the preparation of steel. There is a trade in timber, corn and furs, and there is easy communication by water with St. Petersburg. Pop. '91, 12,205.

PETRUS LOMBARDUS. See LOMBARD, PETER.

PETSH, or IPEK (i.e., silk), a t. of European Turkey, in Albania, stands on the Bistritza, or White Drin, 73 m. n.e. of Scutari. It is a pleasant town; the houses are large and handsome, and, as a rule, have gardens attached, in which fruit and mulberry-trees are cultivated. Silk is extensively made, tobacco and fruits are largely cultivated, and arms manufactured. Petsh has a celebrated monastery, before 1690 the residence of the Servian patriarchs. Pop. 15–18,000 mostly Mohammedans.

PETTENKOFER, MAX VON, b. Bavaria, 1818; a chemist, studied at Munich, and 1845–47 was employed in the Bavarian mint; afterward prof. of medicine. He was associate editor of the *Zeitschrift für Biologie* in 1865. He wrote a valuable work on ventilation, and of his productions there were published, in 1858, *Die atmospherische Luft in Wohngebäuden;* in 1870–72, *Ueber Oehlfarbe und Conservirung der Gemäldegalerien durch Regeneration der Bilder;* in 1871, *Die Verbreitungsart der Cholera in Indien.*

PETTIGREW, CHARLES, D.D., 1748–1807; b. Penn. His father was originally of a Scottish family, and emigrated to Pennsylvania about 1770, and thence to North Carolina. In 1773 Charles became a teacher in Edenton; was ordained in the Protestant Episcopal church at London in 1775, and elected bishop of N. C. in 1794. He took a leading part in establishing the university of North Carolina.

PETTIGREW, THOMAS J., 1791–1865, b. Eng.; studied for the profession of medicine, and was appointed secretary and registrar of the medical society of London. In 1810 he founded the philosophical society of London, and 3 years later was made secretary to the royal humane society, which office he held until 1820. He was surgeon-in-ordinary to the duke of Kent, and the duke of Sussex; and being appointed librarian to the latter, compiled the *Bibliotheca Sussexiana*, one of the chief bibliographical works, on which he was engaged for 12 years. He was a friend of Coleridge; was one of the founders of the Charing Cross hospital, and of the British archæological association; and was for a long time a prominent official in the latter institution, and editor of its *Journal.* He was devoted to antiquarian research, particularly in Egyptian archæology, a fact which brought him into intimate relation with Belzoni, Wilkinson, and other Egyptologists. He published a number of works on curious and recondite subjects, including *Superstitions connected with Medicine and Surgery.*

PETTIS, a co. in w. central Missouri, drained by Muddy and Flat creeks and Black river, on the Missouri, Kansas and Texas, the Missouri Pacific and other railroads;

668 sq.m. pop. '90, 31,151 inclu. colored. The surface is diversified and heavily wooded. The soil is fertile, and the principal productions are corn, wheat, oats, hay, and live stock. It contains extensive deposits of coal. Co. seat, Sedalia.

PETTRICH, FERDINAND, 1798–1872; b. Dresden; son of Franz a sculptor, studied the art of sculpture at the academy at Dresden, and with Thorwaldsen at Rome. He came to the U. S. in his youth, was appointed director of the academy of art in Pennsylvania, and passed some time in Brazil. He is best known by his statues of "Belisarius," "Christ," and the bas-relief "Day and Night."

PETTY, Sir WILLIAM, 1623–87; b. Ramsey, Eng.; son of Anthony Petty; educated at the grammar school in his native town, and at the university at Caen, Normandy. After his return from France he held an official position in the British navy, but left it for the study of medicine at Paris, reading Vesalius with Hobbes, and visiting Leyden and Utrecht. He invented the *pentagraph*, a copying machine patented 1647, but there was then no demand for it. He went to Oxford as assistant to Dr. Clayton, prof. of anatomy, at the same time giving private instruction; obtained a fellowship at Brazenose college 1648. He was prof. of anatomy in the university of Oxford 1650; prof. of medicine in Gresham college 1651; physician to the army in Ireland 1652, serving as secretary under 3 successive lords—lieut. Lambert, Fleetwood, and Henry Cromwell; entered parliament 1658; was knighted and made surveyor-general of Ireland. He was one of the founders of the Royal society which held its first meetings at his lodgings; was the progenitor of the house of Lansdowne, and is called the founder in England of the science of political economy. Among his published works are, *The Political Anatomy of Ireland*, 1691. *Taxes and Contributions*, 1667.

PETTY BAG OFFICE, one of the branches of the court of chancery, was abolished in 1874, and its duties were transferred. The clerk of the petty bag, an officer appointed by the master of the rolls, drew up writs of summons to parliament, *congés d'élire* for bishops, writs of *scire facias*, and all original writs. A great deal of miscellaneous business was also transacted in the petty bag office, which the lord chancellor and master of the rolls were empowered to regulate and transfer from time to time. By the act of 37 and 38 Vict. c. 81, these various duties have devolved on the clerk of the crown in chancery and on officers of the supreme court.

PETTY OFFICERS, in the English navy, are an upper class of seamen, analogous to the non-commissioned officers in the army. They comprise the men responsible for the proper care of the several portions of the ship, the foremen of artificers, the signalmen, and many others. They are divided into three classes; chief petty officers, at 2s. 5d. to 6s. a day; first-class working petty officers, at 2s. 2d. a day; and second-class working petty officers at 2s. a day. Petty officers are appointed and can be degraded by the captain of the ship. Her efficiency much depends on this useful class of sailors.

PETTY SESSIONS is the court constituted by two or more justices of the peace in England when sitting in the administration of their ordinary jurisdiction. Though for many purposes statutes enable one justice to do acts auxiliary to the hearing and adjudication of a matter, yet the jurisdiction to adjudicate is generally conferred upon the justices in petty sessions, in which case there must be at least two justices present, and this is called a petty sessions, as distinguished from quarter sessions, which generally may entertain an appeal from petty sessions. For the purpose of securing always sufficient justices, the whole of the counties of England are subdivided into what are called petty sessional divisions, those justices who live in the immediate neighborhood being the members who form the court of such division. This subdivision of counties is confirmed by statute, and the justices at quarter sessions have power from time to time to alter it. Each petty sessions is held in some town or village which gives it a name, and a police-court or place is appropriated for the purpose of the sittings of the court. There is a clerk of each petty sessions, usually a local attorney, who advises the justices and issues the summons and receives the fees made payable for steps of the process. The justices in petty sessions have a multifarious jurisdiction, which they exercise chiefly by imposing penalties authorized by various acts of parliament, as penalties against poachers, vagrants, absconding workmen and apprentices, etc. They also have jurisdiction to hear charges for all indictable offenses, to take depositions of witnesses, and, if they think a case of suspicion is made out, to commit the party for trial at the quarter sessions or assizes, and to bind over the witnesses to attend. See also JUSTICE OF THE PEACE.

PETU'NIA, a genus of plants of the natural order *solanaceæ*, natives of the warmer parts of America. They are herbaceous plants, very nearly allied to tobacco, and with a certain similarity to it in the general appearance of the foliage, which has also a slight viscidity and emits when handled a disagreeable smell, but the flowers are very beautiful, and varieties improved by cultivation are amongst the favorite ornaments of our greenhouses and flower-borders. The petunias, although perennial, are very often treated as annuals, sown on a hot-bed in spring, and planted out in summer, in which way they succeed very well, even in Scotland. They are tall plants, with branching weak stems, and may readily be made to cover a trellis. Although, when treated as green-house plants, they become half-shrubby, they do not live more than two or three years. The

name petunia is from the Brazilian *petun*. The first petunia was introduced from Brazil in 1823.

PETUNTSE', a white earth used by the Chinese in the manufacture of porcelain, and said to consist of comminuted but undecomposed feldspar. It is fusible, and is used for glazing porcelain.

PET'WORTH, or SUSSEX MARBLE, is a thin layer of limestone, composed of the shells of fresh-water paludinæ. It has been long, but not extensively, used for ornamental purposes. A polished slab of it was found in a Roman building at Chichester, and pillars formed of it exist in the cathedrals of Chichester and Canterbury.

PEUTINGERIAN TABLE, the name given to a most interesting ancient document, which exhibits the military roads of the Roman empire, and indeed of the world known to the Romans. It is not, properly speaking, a map; no regard being paid to geographic position, or the extent of countries. The great lines of road are laid down in a narrow strip, as if nearly parallel, all proceeding from Rome as a center; and as to rivers, it only appears whether they cross the road from left to right or from right to left of the traveler proceeding from Rome. The Mediterranean and other seas are represented by mere narrow channels. A small house is the mark for a town; important towns and military stations are distinguished by walls and towers. Rome, Constantinople, and Antioch are each represented by a circle, within which is a human figure seated; in the case of Rome the figure is crowned. Until very recently a portion of the only copy of this valuable relic of antiquity known to exist was evidently wanting, as it terminated abruptly on the west at the confines of Spain, and included only the eastern parts of Britain. In the e. it traces roads through India to a number of places of trade as far as the mouths of the Ganges. It is on parchment, and as described in all the publications devoted to it, 21 ft. in length, and about 1 foot wide. It was found in the library of the Benedictine monastery at Tegernsee, in upper Bavaria, in the 15th c., by Conrad Celtes, who bequeathed it to Conrad Peutinger of Augsburg, a zealous antiquary, and one of the earliest authors on the Roman and other antiquities of Germany. Peutinger began to prepare a copy of it for publication, but died before he could accomplish his purpose, which, however, was partially executed by Mark Welser, in his *Fragmenta Tabulæ Antiquæ ex Peutingerorium Bibliotheca* (Venice, 1591). The ancient document itself remained in the hands of the Peutinger family, and attracted no further notice till it was offered for sale in 1714, and purchased by prince Eugene, who presented it to the imperial library of Vienna, in which it still remains. An exact copy of it was published at Vienna in 1753, with an introduction and index by F. C. von Scheyb. It was again published as an appendix to Katancsich's *Orbis Antiquus* (Ofen. 1825); and at the request of the academy of Munich, a revised edition, with an introduction, was published by Conrad Mannert (Leip. 1824). Since that time a leaf detached from the rest has been found in the imperial library at Vienna. See Miller's edition of the same, Ravensburg (1888).

The Peutingerian table does not always agree with the Antonine itinerary (see ITINERARY); some stations and towns being marked in the one which are not in the other, the distances marked being also sometimes different. But the two together throw great light on ancient geography. It appears almost certain from internal evidence that the Peutingerian table belongs to the 3d c. of the Christian era, or the beginning of the 4th, although the existing copy seems to belong to a later date. The general character of the work seems to show that its authorship is to be referred to times of prevalent paganism; whilst a few things appear, probably alterations or insertions of a copyist, which refer to Christianity.

PEWEE, a common name given to several species of American insectivorous birds, of the sub-order *clammatores*, family *tyrannidæ*, and related, of course, to the common barn-yard fowl, but more nearly to the king-bird and other fly-catchers. The common pewee or phœbe bird (*sayornis fuscus*, Baird) measures about 8 in. across the extended wings. It is a beautiful brown on the back, darker on the head, with a yellowish-white breast and belly; quills brown, slightly edged with a lighter color, a sort of dull white. Its principal habitat is the middle and Atlantic states, from northern Maine to Florida, living in northern portions during summer and migrating to the south in the autumn. It comes north in April, and usually hatches a brood by the middle of May and another by the first of August. In October it returns to the south, migrating at night. It makes a nest like a barn swallow, attached to a wall or rafter, of mud, grass, mosses, etc., lining it with down and other soft materials, and the same bird may use the nest more than one season. It lays from four to six eggs, white, with a few reddish spots at the larger end. The hatching takes about 13 days, and in 3 or 4 days more the young birds leave the nest. This bird has been seen by Prof. Aughey in eastern Nebraska along the Missouri river, who found in its stomach numerous locusts and other insects; in one instance 43 locusts. Its note of *pee-wee*, or *phœ-be*, is well known. The WOOD PEWEE (*contopus virens*, Cab.) measures from 10 to 11 in. across the outspread wings, with the color of the back much like that of the phœbe bird, but it has two pale grayish bands across the wings, a narrow whitish circlet around the eyes, and has a greenish-yellow belly and grayish throat and breast. Its flight is rapid, with sudden sweeps when darting after its insect prey, which it pursues in the night. It also eats berries. Its note somewhat

resembles that of the phœbe bird, but is more frequently single syllabled than with that bird. It comes north two or three weeks later than the phœbe bird, some of them going as far north as New Brunswick and Nova Scotia. They return as far south in the winter as New Grenada. They also penetrate the west as far as the high central plains. One dissected by Prof. Aughey in 1869 was found to be a destroyer of locusts. Its nest is attached to the branch of a tree, the eggs four or five, light yellowish, with reddish spots at the larger end. It is very courageous, defending its nest against *all* intruders. Two broods are raised at the north where the season is long enough. Prof. Aughey also notices the western wood pewee (*contopus Richardsoni*, Baird) which resembles the "wood pewee" except having shorter legs, longer wings, and larger feet. It is found from the 60th parallel of latitude to Panama and from the great plains to the Pacific.

PEWS (anciently *pues;* Old Fr. *puys;* Dutch, *puyes;* Lat. *podium*, "anything on which to lean;" *s'appuyer*), inclosed seats in churches. Church-seats were in use in England some time before the reformation, as is proved by numerous examples still extant, the carving on some of which is as early as the decorated period, i.e., before 1400 A.D.; and records as old as 1450, speak of such seats by the name of *pues*. They were originally plain fixed benches, all facing east, with partitions of wainscoting about 3 ft. high, and sides of the width of the seat, paneled or carved; the sides sometimes rising above the wainscoting, and ending in finials or poppies, or else ranging with it and finished with a molding. After the reformation, probably under the influence of the Puritans, who, objecting to some parts of the service which they were compelled to attend, sought means to conceal their nonconformity, pews grew into large and high inclosures, containing two or four seats, lined with baize, and fitted with doors, desks, and cushions. Pews were early assigned to particular owners, but at first only to the patrons of churches. A canon made at Exeter, in 1287, rebukes quarreling for a seat in church, and decrees that none shall claim a seat as his own except noblemen and the patrons. Gradually, however, the system of appropriation was extended to other inhabitants of the parish, to the injury of the poor, and the multiplication of disputes.

The law of pews in England is briefly this: All church-seats are at the disposal of the bishop, and may be assigned by him, either (1) directly by faculty to the holders of any property in the parish; or (2) through the churchwardens, whose duty it is as officers under the bishop, to "seat the parishioners according to their degree." In the former case, the right descends with the property, if the faculty can be shown, or immemorial occupation proved. In the latter, the right can at any time be recalled, and lapses on the party ceasing to be a regular occupant of the seat. It appears that by common law every parishioner has a right to a seat in the church, and the churchwardens are bound to place each one as best they can. The practice of *letting* pews, except under the church-building acts, or special local acts of parliament, and, much more, of *selling* them, has been declared illegal. In some parts of the United States, pews in churches are a matter of annual competition, and bring large sums. Latterly, in England, there has been some discussion as to the injuriously exclusive character of the "pew system," and a disposition has been manifested to abolish pews altogether, and substitute movable seats available by all indiscriminately. Several pamphlets have appeared on the subject. In the Roman Catholic churches on the continent pews are seldom to be seen.

PEWTER, a common and very useful alloy of the metals, tin and lead. Two other kinds of pewter have a more compound character. Common, or *ley-pewter*, consists of 4 parts of tin and 1 part of lead; *plate-pewter* is made of 100 parts of tin, 8 parts of antimony, 2 parts each of bismuth and copper; another kind, called *trifle*, is composed of 83 parts of tin and 17 parts of antimony. Although these are the standard formulas, each kind is often much varied to suit the purposes of the manufacturer; the chief alteration being the addition of a large proportion of lead to the last, and a large increase of the same metal in the other two.

PEYER, JOHANN CONRAD, 1653–1712; b. Switzerland. He graduated in medicine at Basle in 1681, practiced medicine there, became professor of elocution and of logic, and afterwards of natural philosophy. He made many dissections and examinations of glands of the mucous membrane of the intestines, particularly of certain aggregations of lymphoid follicles which have since been known as Peyer's glands, or the patches or plaques of Peyer. See PEYER'S GLANDS; also, DIGESTION.

PEYER'S GLANDS, aggregations of solitary lymphoid follicles, first described by Johann Conrad Peyer (q.v.), principally found in the *ileum*, the lower division of the small intestine, and connected with the functions of digestion and chylification. See DIGESTION. The solitary glands which are not aggregated have essentially the same structure as those which make up the patches of Peyer, or "Peyer's glands."

PEYRON, VITTORE AMEDEO, Abbé, 1785–1870; b. Italy; professor of the oriental languages at Turin. He placed the study of Coptic on a scientific basis by his *Grammatica Linguæ Copticæ*, and *Lexicon Linguæ Copticæ:* edited a number of Greek and Latin texts, some of which he discovered himself, and rendered Thucydides into Italian. He was a senator of the kingdom of Italy, and corresponding member of the French institute.

PEYRONNET, Charles Ignace, Comte de, 1788–1854; b. at Bordeaux, France; whose father was one of the victims of the guillotine in 1793. He was educated for the bar, where he was eloquent but not able; a pronounced advocate of the Bourbons; entered public life with the advent of Louis XVIII. to the throne, and became minister of justice in 1821. In 1822 he proposed the law to muzzle the press, and favored all measures looking to the restoration of absolute kingly power and the feudal status, including the re-establishment of the law of primogeniture. On the dismissal of the Villèle cabinet in 1828 by Charles X., Peyronnet went with it; but became minister of the interior in 1830, and by his policy of reaction contributed to the overthrow of Charles X. the same year. He was subsequently imprisoned at Ham for illegal use of power while in office, and there wrote an *Histoire des Francs* in 2 vols.

PÉZÉNAS, a manufacturing t. of France, in the department of Hérault, on the left bank of the river of that name, 25 m. w.s.w. of Montpellier. It stands in a district remarkable for its beauty, and so well cultivated as to have received the name of the garden of Hérault. It is famous for its healthy climate and clear sky. The vicinity produces excellent wine, and oil, leather, and iron and copper goods are manufactured. The trade, however, is chiefly in brandy. Pop. '91 (comm.), 6191.

PFALZBURG, a town in German Lorraine, on the w. slopes of the Vosges, 25 m. w.n.w. of Strassburg, 2 m. n. of the Rhine and Marne canal. It passed into the hands of the French, 1661. The town commanded the passes of the Vosges, and was strongly fortified by Vauban, 1680; but the defenses were razed by the Germans on their capture of the place after four months' siege, 1870. It contains shoe and hat factories. Pop. '95, with garrison, 3887.

PFEFFERS, or Pfäffers, an extraordinary and much-visited locality in the canton of St. Gall, Switzerland, 5 m. s.e. of Sargans. It has been famous since the middle of the 11th c. for its hot baths, situated 2,265 ft. above sea-level, and 520 ft. above the village of Ragatz. The old baths of Pfeffers are built on a ledge of rock a few feet above the roaring torrent of the Tamina, and are hemmed in by walls of rock towering above them to the height of 600 ft., and so far burying the baths within the gorge that, even in the height of summer, sunlight appears above them only from ten to four. Above the old baths, the walls of the ravine of the Tamina contract until they meet, covering up the river, which is there seen from a cavernous gap. The hot springs are reached from the baths by means of a railed platform. This platform, leading to the hot spring, is secured to the rocks, and the Tamina churns its way through the cleft 30 or 40 ft. below.

PFEIFFER, Ida (*née* Reyer), a celebrated female traveler, was b. at Vienna, Oct. 15, 1797, and from her earliest years showed a resolute and fearless, but not unfeminine disposition. In 1820 she married an advocate, named Pfeiffer, from whom she was obliged to obtain a separation, after she had borne him two sons, Oscar and Alfred, whose education devolved on herself. When she had settled them in life, and was free to act as she pleased, she at once proceeded to gratify, at the age of 45, her long-cherished inclination for a life of travel and adventure. Her first expedition was to the Holy Land. She left Vienna in Mar., 1842, and returned in December of the same year, having traversed, alone and without guide, European and Asiatic Turkey, Palestine, and Egypt. She published an account of her eastern rambles in the following year (*Reise einer Wienerin in das Heilige Land*), which, like all her other works, has gone through many editions, and been translated into French and English. In 1845 she visited northern Europe —Sweden, Norway, Lapland, and Iceland—and recorded her impressions in her *Reise nach dem Skandinavisch, Norden und der Insel Island* (2 vols., 1846). But these journeys, which would have satisfied most women, were but little excursions in the eyes of this insatiable nomad, and only served to whet her appetite for something vaster. She resolved on a voyage round the world, and on June 28, 1846, sailed from Hamburg in a Danish brig for Brazil. Her descriptions of the scenery of that country and of the inhabitants—both native Indians and Brazilians—are exceedingly interesting. She then sailed round cape Horn to Chili, and thence, after some time, across the Pacific to Otaheite, China, and Calcutta; crossed the Indian peninsula to Bombay, whence she took ship for the Persian gulf, landed at Bassora, traversed a great part of western Asia, southern Russia, and Greece, and re-entered Vienna, Nov. 4, 1848. Two years later she published a narrative of her travels and adventures, entitled *Eine Frauenfahrt um die Welt* (Vienna, 1850, 3 vols.). As a small recognition of her services, and of her singular energy, fortitude, and perseverance of her character, the Austrian government granted Mme. Pfeiffer a sum of $500. She now determined to go round the world again, but by a different route. Proceeding to England, she, in May, 1851, took ship for Sarawak, rounding the cape of Good Hope, penetrated alone to the heart of Borneo, visited Java and Sumatra, lived for a time with some cannibal tribes, and sailed from the Moluccas to California, thence to Peru, scaled the peaks of Chimborazo and Cotopaxi, made a run through the principal of the United States, and returned to London in 1854. This second voyage, signalized by several scientific observations, is described in *Meine*

Zweite Weltreise (Vien., 1856). But the more she traveled, the fiercer became her hunger for movement. In Sept., 1856, she set out on what was to be her last expedition — namely, to Madagascar. After enduring terrible hardships, she got away, and came home to Vienna—to die. Her death took place Oct. 28, 1858.

PFENNIG is a division of currency in Germany equal to one-hundredth of a mark. The mark equals one English shilling, or twenty-five cents in U. S. money, therefore the pfennig equals two and a half mills in U. S. or decimal currency.

PFORZHEIM, an important manufacturing t. of the grand duchy of Baden, on the northern border of the Black Forest, stands on the Enz, at its confluence with the Nagold and Wurm, 16 m. s.e. by e. of Karlsruhe, and on a recently constructed branch of the Mannheim and Basel railway. Pforzheim contains the remains of an ancient castle, formerly the residence of the margraves of Baden-Durlach; several churches; a convent; industrial and other schools; chemical and iron works; machine-shops, tanneries, and paper and other factories. It is the largest manufacturing center of cheap jewelry in the world, introduced by French emigrants. Pop. '91, 33,331.

PHÆDO, or **PHÆDON**, b. Greece 4th c.; taken prisoner in war and made a slave Coming to Athens he became acquainted with Socrates, who induced Alcibiades or Crito to release him from servitude. He wrote a number of dialogues, was the founder of the Eleatic school of philosophy, and is the person to whom Plato inscribed his dialogue of that name.

PHÆDRA, in Greek legend and tragedy, the daughter of Minos, king of Crete, and of Pasiphaë, sister of Ariadne and wife of Theseus. Venus, enraged against Hippolytus, Phædra's step-son, for neglecting her worship, and against Phædra, as being the daughter of Pasiphaë, inspired the latter with a passion for Hippolytus. On the rejection of her advances, she falsely accused the youth to Theseus, who demanded his life from Neptune. Hippolytus was thrown from his chariot on the sea-shore and dragged upon the sands till dead. Phædra died by her own hand and Theseus learned too late that he had destroyed his son without cause. This story, with modifications, was the subject of tragedies by Sophocles and Euripides, and Racine's Phédre, 1677, is one of the masterpieces of the French drama.

PHÆ'DRUS, a Latin poet, whose works consist of fables. He was probably a Thracian or Macedonian, carried to Rome as a slave in his childhood, and brought up at the court of Augustus, who emancipated him. Under Tiberius, he was exposed to great danger from the hostility of Sejanus, but lived to see that general's overthrow, and died at an advanced age, probably in the reign of Claudius. Five books of fables, after the manner of Æsop, and called *Fabulæ Æsopiæ*, have been usually ascribed to him. The faults of the style have led, however, to the suspicion, not merely of alterations at a later date, but of later, and even much later, composition. The dry "morals" have been supposed to indicate the middle ages as the period to which the work should probably be referred; but its authenticity is generally admitted. The first edition was published at Troyes in 1596. The text has subsequently occupied the attention of some of the greatest scholars and critics, from the days of Burmann and Bentley to the present time. A sixth book, containing 32 fables, has recently been discovered and published, of the authenticity of which, however, there are greater doubts than that of the other books. The best editions are those of J. C. Orelli (Zürich, 1831) and L. Müller (Leip. 1877).

PHÆNOG'AMOUS PLANTS. See PHANEROGAMOUS PLANTS.

PHAËTHON (i.e., the shining), in the writings of Homer and Hesiod, a frequent title of Helios the sun-god, and subsequently employed as his name.—Phaëthon, in Greek mythology, is also the name of a son of Helios, famous for his unfortunate attempt to drive his father's chariot. Scarcely had the presumptuous youth seized the reins, when the horses, perceiving his weakness, ran off, and approaching too near the earth, almost set it on fire. Whereupon the earth cried to Jupiter for help, and Jupiter struck down Phaëthon with a thunderbolt into the Eridanus or Po. His sisters, the Heliades, who had harnessed the horses of the sun, were changed into poplars, and their tears into amber.

PHAËTON. See TROPIC BIRD.

PHAGEDE'NA (Gr., from *phagein*, to eat or corrode) designates a variety of ulceration in which there is much infiltration, and at the same time rapid destruction of the affected part. The sore presents an irregular outline and a yellowish surface; it gives off a profuse bloody or ichorish discharge, and is extremely painful. It usually attacks persons whose constitutions are vitiated by scrofula, by the syphilitic virus, by the abuse of mercury, by intemperance, etc. It not very unfrequently appears in the throat after scarlatina in a severe form. If relief is not afforded by the internal administration of opium (to allay the pain), and of quinia, or some other preparation of bark, wine, beef-tea, etc., to improve the tone of the constitution, together with astringent and sedative

local applications, recourse must be had to the destruction of the part by strong nitric acid, or some other caustic.

The terrible disease known in civil practice as SLOUGHING PHAGEDENA, and in military and naval practice as HOSPITAL GANGRENE, is merely, according to some of our highest surgical authorities, a state of phagedena in its fullest development. This disorder requires for its development the influence of some of those undefined causes which regulate the outbreak of epidemics, and is peculiarly characterized by its contagious and infectious nature. It is usually engendered by the overcrowding of sick and wounded men, and some idea of its virulence may be formed from the fact that on the return of the French fleet from the Crimean war, no less than 60 deaths from it occurred in one ship in the course of 38 hours. It is not of frequent occurrence in the London hospitals; but it broke out in the Middlesex hospital in 1835, in University College hospital in 1844, and in St. Bartholomew's and St. George's hospitals in 1847 (Druitt's *Surgeon's Vade-mecum*, 8th ed. p. 72, *note*). For details respecting this disorder the reader is referred to Hennen's *Principles of Military Surgery*, Boggie *On Hospital Gangrene*, and the article on "gangrene," by Mr. Holmes Coote in Holmes's *System of Surgery*, vol i.

PHALACRO'CORAX. See CORMORANT.

PHALÆ'NA. See MOTH.

PHA'LANGER, or PHALANGIST, *Phalangista*, a genus of marsupial quadrupeds, having a rather short head, short ears, short woolly fur, a long prehensile tail, sometimes completely covered with hair, and sometimes only at the base, and scaly towards the extremity; the dentition somewhat various as to the number of premolars, the incisors always six in the upper jaw and two in the lower, the true molars eight in each jaw, the canines of the lower jaw very small, and close to the incisors. The fore-paws are strong, and capable of much use in grasping food and bringing it to the mouth. A number of species inhabit Australia and the islands to the n. of it. They live chiefly in trees, and feed on insects, small animals of various kinds, eggs, and fruits. The SOOTY PHALANGER or TAPOA (*P. fuliginosa*) is pretty common in Van Diemen's Land, and is much sought after on account of its fur, which is of a uniform smoky-black color, or tinged with chestnut, warm and beautiful. The tail is very bushy. It is nocturnal in its habits.—The VULPINE PHALANGER (*P. vulpina*), also called the VULPINE OPOSSUM, is very plentiful and widely diffused in Australia. The length of the animal from the point of the muzzle to the root of the tail is about 26 in.; the tail is about 15 in. long, and is bushy; the color is grayish-yellow on the upper parts, and tawny-buff below. The fur is not so much valued as that of the last species, but is used for various purposes. The flesh, although it has a strong peculiar flavor, is a favorite food of the Australian aborigines.—Nearly allied to this genus, is the genus *cuscus*, of which one species, whitish-gray, spotted with brown, is plentiful in the Molucca and Papuan islands.—Allied to the phalangers also are the flying phalangers (q.v.).

PHALAN'GIDÆ, a family of trachearian arachnida, popularly called *harvest-men*, some of the species appearing in great numbers in fields during the hay and corn harvests. They resemble spiders in their general form, although their organs of respiration are very different. Their legs are extremely long and slender. Most of the species are very agile.

PHALANSTE'RIANISM (from Gr. signifying phalanx and solid), the system of living in communities called phalansteries, as suggested by Fourier, the French socialist. See FOURIERISM.

PHA'LANX, the ancient Greek formation for heavy infantry, which won for itself a reputation of invincibility, may be described as a line of parallel columns, rendered by its depth and solidity capable of penetrating any line of troops. The oldest phalanx was the Lacedæmonian or Spartan, in which the soldiers stood eight deep; the Athenian phalanx had been the same, until, at the battle of Marathon (480 B.C.) Miltiades reduced the depth to four men in order to increase his front. When Epaminondas organized the Theban army against Sparta, he felt that the Spartan line of battle would be impregnable to troops organized in their own manner. He therefore increased the depth and lessened the front of his phalanx, which enabled him to burst through the Spartan line, inflicting the sanguinary defeat of Leuctra (371 B.C.). Philip of Macedon had learned the art of war under Epaminondas, and when he resolved to make his state a military power, he formed the celebrated Macedonian phalanx (359 B.C.), which enabled him to conquer Greece, and with which his son Alexander subdued the eastern world. The Macedonian phalanx, as the latest form that organization assumed, and as the shape in which the phalanx encountered the military skill of the west, is deserving of description. The line was 16 deep; a grand-phalanx comprising 16,384 *hoplites*, or heavy-armed soldiers, subdivided as follows: the grand-phalanx was composed of four phalanxes or divisions, each under a general officer, called a *phalangarch;* his command was divided into two brigades or *merarchies* (sometimes called *telarchies*), each of these comprising two regiments, or *chiliarchies*, of four battalions or *syntagmata* each. A *syntagma* answered accurately to a modern battalion, except that it was smaller. It was a perfect

square, with 16 men each way, was commanded by a *syntagmatarch* or *xenagos;* and had an adjutant, with one or two other staff officers who stood behind. Eight files united were under a *taxiarch,* four under a *tetrarch,* corresponding probably to a modern capt., two files were under a *dilochite* or subaltern. A single file of 16 men was called a *lochos,* and the best man was placed at its head; a picked man, the *ouragos,* also marching in the rear. The arms of all these phalanx-men were pikes or spears, 24 ft. long, of which 6 ft. were behind and 18 ft. held in front of the combatant. As each man occupied with his shield 3 ft., the phalanx, when it advanced, had six tiers of spear-points in front, a wall of steel which no troops could withstand, especially as the bearers of the spears were pressed on by the ten ranks in their rear. By rapid movements the phalanx could change front, form in close column of syntagmata, and execute other critical maneuvers. —The heavy-armed phalanx was ordinarily flanked by *peltastes* or light infantry, similarly formed, but only eight deep, while the cavalry were but four deep. The phalanx, as representative of the heavy formation, came in contact with the lighter legion of Rome during the wars of Pyrrhus in Italy.—At the great battle of Heraclea (279 B.C.), the phalanx won the day; but the victory was attributable to other causes as much as to any superiority of formation.

PHAL'ARIS, a tyrant of Agrigentum in Sicily, who flourished about the middle of the 6th c. B.C. According to the prevalent tradition, he was infamous for his cruelty. He maintained his power for 16 years by the aid of foreign hirelings, and, it is said, by putting to death all persons of eminence in his dominions; but at last he fell a victim to popular indignation. He gratified, we are told, his love of cruelty by causing persons to be roasted alive in a brazen bull, which was made for that purpose—the first victim being the maker, Perillus. Cicero calls him the "most cruel of all tyrants" (*crudelissimus omnium tyrannorum*). But some doubt attaches to this view of his character, partly because many of the crimes laid to his charge are intrinsically improbable, and partly because later traditions represent him as fond of literature and philosophy, and a patron of learned men. Lucian affirms that he was naturally a man of a mild and humane disposition. How far the later view should be allowed to modify the earlier, it is—in the absence of all reliable knowledge—impossible to say. It is under the later aspect that he is shown to us in the famous but spurious *Epistles of Phalaris.* See BENTLEY.

PHA'LAROPE, *Phalaropus,* a genus of birds of the family *lobipedidæ* (q.v.); having a rather long, slender, weak, straight bill, resembling that of the sandpipers, which, indeed, they otherwise much resemble, although differing in their aquatic habits; the greater part of their time being passed in swimming on the sea, where they seek mollusks and other small marine animals for their food. The GRAY PHALAROPE (*P. lobatus*), although formerly so rare a bird in Britain that Pennant says he only knew of two instances of its occurrence in his time, is now not unfrequently seen in its autumn migration from its northern abode to its southern winter-quarters. It breeds in the arctic regions both of the old and new world, migrating southward in both on the approach of winter. Its entire length is rather more than 8 inches. The tail is short. It is a beautiful bird, and remarkable for the great difference of its summer and winter plumage, the prevailing tint in winter being a delicate gray, whilst in summer the upper parts exhibit a fine mixture of black, white, and yellow, and the breast and under parts are reddish chestnut.—The RED-NECKED PHALAROPE (*P. hyperboreus,* or *lobipes hyperboreus,* a generic distinction being made by Cuvier and others, on account of the sharper and more slender bill), breeds in some of the northern Scottish islands, although it is more common in more northern regions, and, like the former, is found in all the northern parts of the world. It is rather smaller than the gray phalarope, and is, like it, very graceful in form and movements, and finely colored. The phalaropes are very fearless of man, and very easily tamed. Their flesh is oily and unpalatable.

PHAL'LUS, a representation of the male generative organs, used at certain Dionysian festivals in ancient Greece, as a symbol of the powers of procreation. It was an object of common worship throughout the nature-religion of the east, and was called by manifold names, such as linga (q.v.), joni, pollear, etc. Originally it had no other meaning than the allegorical one of that mysterious union between the male and female, which throughout nature seems to be the sole condition of the continuation of the existence of animated beings; but at a later period, more particularly when ancient Rome had become the hot-bed of all natural and unnatural vices, its worship became an intolerable nuisance, and was put down by the senate on account of the more than usual immorality to which it gave rise. Its origin has given rise to much speculation, but no certainty has been arrived at by investigators. The Phenicians traced its introduction into their worship to Adonis, the Egyptians to Osiris, the Phrygians to Attys, the Greeks to Dionysus. The common myth concerning it was the story of some god deprived of his powers of generation—an allusion to the sun, which in autumn loses its fructifying influence. The procession in which it was carried about was called phallagogia, or periphallia, and a certain hymn was sung on that occasion, called the Phallikon Melos. The bearers of the phallus, which generally consisted of red leather, and was attached to an enormous pole, were the Phallophoroi. Phalli were on those occasions worn as

ornaments round the neck, or attached to the body. Aristotle traces the origin of comedy to the ribaldry and the improvised jokes customary on those festivals. Phalli were often attached to statues, and of a prodigious size; sometimes they were even movable. At a procession of Ptolemy Philadelphus, a phallus was carried about made of gold, and 120 yds. long. Before the temple of Venus at Hierapolis there stood two phalli, 180 ft. high, upon which a priest mounted annually, and remained there in prayer for seven days. The phallus was an attribute of Pan, Priapus, and to a certain extent also of Hermes.

PHALLUS, a genus of fungi of the division *gasteromycetes,* egg-shaped, the outer covering at length bursting to permit the growth of a stem, the receptacle which produces the spores, and which is surmounted by a rudimentary *pileus.* The most common British species, *P. impudicus* or *fœtidus,* popularly called *stinkhorn,* is as large as a hen's egg, growing underground in thickets, and finally sending up a stem 4 to 6 in. high, the fetid smell of which is felt for many yards around. The egg is full of a jelly-like substance. The growth of the stem is very rapid, and it soon decays.

PHANARIOTES. See FANARIOTS.

PHANEROG'AMOUS PLANTS (Gr. *phaneros,* manifest; *gamē,* marriage), or PHÆNOGAMOUS (Gr. *phaïno,* to show) PLANTS, are those plants which have true flowers, and in which the sexual organs (stamens and pistils) are distinctly notable. They are also called FLOWERING PLANTS, being by all these names contradistinguished to cryptogamous plants (q.v.). The seeds of phanerogamous plants originate from ovules (q.v.), and already contain the young plant, more or less perfectly formed, which is called the *embryo.* Phanerogamous plants are about three-fourths of all known plants. Among them are included all the larger plants, and all plants of great importance in an economic point of view. They are generally divided into *monocotyledonous* or *endogenous plants,* and *dicotyledonous* or *exogenous plants.*

PHA'RAOH. The name given by the Hebrews to the monarch ruling in Egypt at the time, in the same manner as Cæsar was applied to the Roman emperors, and as Khan is to the Tartar and Shah to the Persian rulers. The word is of uncertain etymology, being capable of two derivations—viz., either *pa ra,* "the sun," which is the leading or first title of all Egyptian monarchs, or the popular expression, *pi ouro,* or *phouro,* "the king." It is even possible to derive it from *pa har,* "the horus," another title of Egyptian monarchs. The greatest difficulties have been encountered in attempting to determine the particular monarchs who pass under this name in the Scriptures. The first-mentioned pharaoh is the one in whose reign Abraham visited Egypt, who is supposed by some chronologists to have been one of the shepherd monarchs, but nothing can be offered beyond mere conjecture in support of this theory. Another pharaoh is the one in whose reign Joseph was brought to Egypt, and who was supposed by Eusebius to be Apophis, one of the later shepherd kings of the 17th dynasty, who are known from the monuments to have immediately preceded the 18th. Bunsen, indeed, places the arrival of Joseph in the reign of Usertesen, or, as he reads his name, Sesertesen I. of the 12th dynasty, in which indeed a famine is stated in the hieroglyphical texts to have happened, and in which it appears numerous officers were established to take charge of the grain. Arguments, however, may be adduced for Joseph having arrived in the time of the 12th dynasty, from the fact of the establishment of the family of Jacob in the land of Goshen, the importance to which Joseph had risen, and the omission of the name of any of the principal Egyptian cities in the narrative, and the fact of Joseph having married Asenath, the daughter of Potipherah, priest of Heliopolis, a city evidently the seat of the court under the 12th dynasty, as Ouar or Avaris was under the shepherds. Equal difficulty is experienced in determining the pharaoh who reduced the Israelites to bondage, employed them in the labors of the brick-field, and compelled them to build the treasure-cities of Pithom and Rameses. He appears to have meditated the total absorption of the Hebrews into the Egyptian race. All that is clear from the narrative is that the city of Rameses was called after his name, in the same manner as modern forts have been by contemporary rulers. Now frequent mention occurs in the papyri and other texts of the *Makatalu en Ramessu,* or Tower of Rameses II., which is represented on the walls of Medinat-Abu; and this has induced Lepsius and Bunsen to depress the date of the exodus from 1491 B.C. to the close of the 19th dynasty, or after Rameses II., a point controverted by other chronologists, who wish to elevate it to the middle of the 18th dynasty, or 1732 B.C. To synchronize the former date, Lepsius takes the rabbinical date of 1314 B.C. for the exodus, or 1340 B.C. for the birth of Moses. The pharaoh of the Exodus is supposed to be Merienptah or Menephthes, the son and successor of Rameses II. Philologically, this explanation is preferable, as the fixed point in the inquiry is the name of the Migdol of Rameses, found both in the Scriptures and on the monuments of Egypt. Other pharaohs are mentioned; as the father of Tahpenes, wife of Hadad and mother of Genubath; the pharaoh whose daughter Solomon married; pharaoh Nechao, or Necho II., who gave battle to Josiah, king of Judah, whom he slew at Megiddo, and who made war against the Syrians, defeated them at Magdolus, and took Cadytus or *Katsh,* on the

Arunata or Orontes. He was subsequently defeated by Nebuchadnezzar at Carchemish, 607 B.C. Pharaoh Hophra, was the Uaphris or Apries of the Greeks, whose destruction was prophesied by Jeremiah, and who was strangled 570 B.C.—Bunsen, *Ægyptens Stelle*, iii. p. 109; Lepsius, *Einleit.* p. 317; Nash, *The Pharaoh of the Exodus* (8vo, Lond. 1862).

PHARISEES (*Perishin* or *Perushim*, Separatists), a so-called "Jewish sect," more correctly, however, a certain Jewish school, which probably dates as a distinct body or party from the time of the Syrian troubles, and whose chief tendency it was to resist all foreign, chiefly Greek, influences that threatened to undermine the sacred religion of their fathers. They most emphatically took their stand upon the law, together with those inferences drawn from its written letter which had, partly from time immemorial, been current as a sacred tradition among the people. Out of the small band of the Chasidim (q.v.), the Pharisees had taken their rise originally as *Chaberim*, friends, colleagues, scholars—in contradistinction to the *Am-Haarez*, or common people—and their chief object in life was the divine law, its study and further development. Principally distinguished by their most scrupulous observance of certain ordinances relating to things clean and unclean, they further adopted among themselves various degrees of purity, the highest of which, however, was scarcely ever reached by any member of their community. For every degree, a special course of instruction, a solemn initiation, and a novitiate was necessary; all of which, together with a certain distinction in dress, seems to have been imitated from them by the Essenes (q.v.). The name of Pharisees or Perushim was probably at first bestowed upon them in derision by the Sadducees or Zadokites, the priestly aristocracy and their party, the Patricians, who differed from them politically, and to some extent also in religious matters. The Pharisees had no special "confession of faith," or articles of creed different from the whole body of Jews. The Bible, as interpreted by the traditional law, was their only code. Obedience to this law, strictest observance of all religious and moral duties, submission to the divine will, full confidence in the wisdom and justice of Providence, firm belief in future reward and punishment, chastity, meekness, and forbearance—these were the doctrines inculcated in their schools. They were, in fact, nothing more or less than the educated part of the people, who saw in the rigid adherence to the ancient religion, such as it had developed itself in the course of centuries, the only means of saving and preserving the commonwealth, notwithstanding all its internal and external troubles. Hence, they wished the public affairs, the state and all its political doings, to be directed and measured by the standard of this same divine law; without any regard for those aristocratic families who ruled, or at all events greatly influenced the commonwealth. These consisted of the priestly families, the Zadokites (Sadducees, q.v.), and of the valiant heroes and sagacious statesmen, who had brought the Syrian wars to a successful issue, and had, by prudent negotiations with other courts, restored the nation to its former greatness, and, on their own part, had acquired wealth and fame, and freer and wider views of life and religion. The latter held the modern doctrine, that religion and state were two totally different things; that God had given man the power of taking his matters into his own hands; and that it was foolish to wait for a supernatural interference, where energy and will were all that were required. Naturally enough, the political difference between the two parties by degrees grew into a religious one, since the Jewish state was one still completely pervaded by the religious element—as indeed it had begun as a theocracy, and could still, to a certain extent, be called by that name. And the more the Sadducees lost their influence—the people siding with the Pharisees—the more the religious gulf must have widened between them; although the divergence between them, as far as our authorities—Josephus, the New Testament, and the Talmud—go, does not seem to have been of a very grave nature. Thus, the Pharisees assumed the dogma of immortality, chiefly with a view to a future reward of good and evil deeds in this world; while the Sadducees, without rejecting—as we are erroneously informed by Josephus—this dogma in the least, yet held that there was nothing in the Scripture to warrant it, and, above all, that there was no need of any future reward; at any rate, that a pious life with a view to this was not meritorious. While the Pharisees held all the traditional ordinances in equal reverence with the Mosaic ones, tracing, in fact, most of the former to Sinai itself, the Sadducees rejected, or rather varied some of these according to the traditions of their own families: these ordinances chiefly relating to priestly and sacrificial observances, certain laws of purity, and some parts of the civil law. It may perhaps even be assumed, with the most recent investigators (chiefly Geiger), that the Pharisees were the representatives of a newer Halacha, dictated by an oppositional and religious and national zeal which carried them far beyond the original boundaries. Certain other legal differences between the two parties, such as the application of the laws of inheritance to daughters, or of the responsibility of the master for his servants, are nothing more than political party-views in a religious mask, which were meant to meet certain special isolated cases only. In general, the Pharisees handled justice in a much milder manner than their antagonists, who took their stand upon the rigid letter, and would hear of no mercy where a violation of the code was clearly made out. Out of the midst of the Pharisees rose the great doctors and masters of the law (*soferim*, scribes; *nomodidaskaloi*, teachers of the law), and to them were intrusted by the later rulers the most important offices.

Until recently the greatest misconception has prevailed, even among scholars, respecting this self-sacrificing, patriotic, pious, learned, and national party of progress. That there were among them those who were a disgrace to any party, and, still more, to their strict one, no one knew better than the Pharisees themselves, and in bitterer words than were ever used by Christ and the apostles, the Talmud castigates certain hyperpious members of their own community as the "plague of Pharisaism." These hypocrites were characteristically styled *Zebuim* [dyed, painted ones], "who do evil deeds like Zimri, and require a godly reward like Phinehas." Seven kinds of Pharisees are enumerated in the Talmud, six of whom were not to be counted as real Pharisees—viz., (1) they who did the will of God for earthly motives; (2) those who made very small steps, or said: Wait for me—I have still some good deed to do; (3) those who knocked their heads against walls, lest they might look at a woman; (4) *ex officio* saints; (5) those who say: tell me of another duty; (6) those who are pious because they fear God. The only genuine Pharisee was he "who did the will of his Father in heaven because he loved him." Josephus's accounts, distortions in themselves, have, to add to the confusion, been misunderstood (thus, for example, the word which he uses to designate the three parties, never meant "sect," as it has invariably been interpreted); and the position of Christ in relation to the Pharisees can never be understood properly without a full acquaintance with the circumstances of the time, to which there is no other way than a knowledge of that literature (the Talmud and Midrash) which has so long been neglected. Christ found the influence of the Pharisees predominant among the people, although the Sadducees (and the Boëthusians) were in reality the ruling classes and allies of the reigning dynasty. He naturally sided with the democratic party of the Pharisees against that of the proud opposite camp. As for the religious tendencies of the latter, the Sadducees (q.v.)—the people had decided that point already practically, by siding with the Pharisees. Once only an allusion is made also to the leaven of Herod = the Sadducees (Mark viii. 15, cf. Matt. xvi. 6). But it was, above all things, necessary to combat the ever-growing tendency to choke up, as it were, all real piety and genuine virtue of heart under external ceremonies and observances, which, unless guarded against, will appear, instead of a mere symbol and memento, the essence of religion itself, and thus become in time a delusion and bondage, and end in that vile hypocrisy against which the Talmud fights with all its powers of derision, and Christ inveighs in much more vehement terms than is his wont. It was not in themselves that these "oral laws" were held up to scorn. They were a necessary and natural growth, and acted, in the main, beneficially; as is now fully recognized by scholars of eminence. (For some further remarks on the subject, see TALMUD.)

Pharisaism—from which gradually branched off the wild democratical party of *zealots* (Kannaim), and which for the last time represented political opinions in the revolution of Bar Cochba—has, from the downfall of the sanctuary, and the final destruction of the commonwealth, to this day remained the principle representative of Judaism as a creed only, Sadduceeism dying out, or, at all events, producing only one such sterile plant as Karaism. See JEWISH SECTS, SADDUCEES.

PHARMACOPŒ'IA. This term has been applied to various works, consisting for the most part of (1) a list of the articles of the materia medica, whether simple or compound, with their characters, and the tests for the determination of their purity; and (2) a collection of approved receipts or prescriptions, together with the processes for articles in the materia medica, obtained by chemical operations. Almost every civilized country of importance has its national pharmacopœia, amongst which those of the United States, France, and Prussia deserve specially honorable notice. The first pharmacopœia published under authority appears to have been that of Nuremberg in the year 1542. A student named Valerius Cordus, who was staying for a short time at Nuremberg, showed a collection of medical receipts, which he had selected from the works of the most eminent writers, to the physicians of that city, who were so struck with its value that they urged him to print it for the benefit of the apothecaries, and obtained for his work the sanction of the senatus. Before this time, the books chiefly in use amongst apothecaries were the treatises: *On Simples* by Avicenna and Serapion; the *Liber Servitoris* of Balchasim ben Aberazerim; the *Antidotarium* of Johannes Damascenus or Mezue, arranged in classes; and the *Antidotarium* of Nicolaus de Salerno, which was arranged alphabetically. This work was commonly called *Nicolaus Magnus*; to distinguish it from an abridgment known as *Nicolaus Parvus*.

Confining our remarks to the British pharmacopœias, we may notice that the first edition of the London pharmacopœia (or, more correctly speaking, of the pharmacopœia of the London college of physicians) appeared in 1618, and was chiefly founded on the works of Mezue and Nicolaus de Salerno. Successive editions appeared in 1627, 1635, 1650, 1697, 1721, 1746, 1787, 1809, 1824, 1836, and 1851; and form an important contribution to the history of the progress of pharmacy and therapeutics during the last two centuries and a half. The nature and the number of the ingredients that entered into the composition of many of the pharmaceutical preparations of the 17th and 18th centuries would equally astonish most of the practitioners and patients of the present day. In the earlier editions we find enumerated earth-worms, snails, wood-lice, frogs, toads, puppy dogs,

foxes ("a fat fox of middle age, if you can get such a one"), the skull of a man who had been hanged, the blood of a cat, the urine and excrements of various animals, etc.; and electuaries were ordered, containing 50, 62, and in one instance—Mathiolus, his great antidote against poison and pestilence—124 different ingredients.

The Edinburgh pharmacopœia is more modern than the London, the first edition having appeared in 1699; while the Dublin pharmacopœia does not date farther back than 1807. The latest editions of these works appeared in the years 1841 and 1850 respectively.

Until the medical act passed in 1858, the right of publishing the pharmacopœias for England, Scotland, and Ireland was vested in the colleges of physicians of London, Edinburgh, and Dublin respectively; and as these three pharmacopœias contained many important preparations, similar in name but totally different in strength (as, for example, dilute hydrocyanic acid, solution of hydrochlorate of morphia, etc.), dangerous complications arose from a London prescription being made up in Edinburgh, or Dublin, or *vice versâ*. By that act it is ordained that "the general [medical] council shall cause to be published, under their direction, a book containing a list of medicines and compounds, and the manner of preparing them, together with the true weights and measures by which they are to be prepared and mixed; and containing such other matter and things relating thereto as the general council shall think fit, to be called *British Pharmacopœia*, which shall for all purposes be deemed to be substituted throughout *Great Britain* and *Ireland*, for the several above-mentioned pharmacopœias."

The *British Pharmacopœia*, of which mention has just been made, a work published in 1864, had the merit of amalgamating the London, Edinburgh, and Dublin pharmacopœias; but it unfortunately contained so many defects, that, in accordance with the universal wishes both of the medical professon and of the chemists, the medical council ordered a new edition to be as speedily as possible prepared. This new edition has met with general favor from the profession; and it is to be hoped that as we have now succeeded in incorporating three distinct works into one, we may, in the course of a few years, hope to have a universal pharmacopœia, or, at all events, one of so general a nature that the most important medicines of the American, British, and chief continental pharmacopœias* shall all be of the same strength. The most important additions to the new edition are benzoated lard (used for making suppositories and ointments), bromide of ammonium (useful for sleeplessness, and in hysteria and epilepsy), carbonate of bismuth and solution of citrate of bismuth and ammonia (useful in the same cases as white bismuth), iodide of cadmium (which may be used in the form of ointment when the yellow color of the skin that follows the application of iodide of lead ointment is objected to), oxalate of cerium (which, in doses of one or two grains, three times daily, acts as a sedative and tonic, and is of great value in chronic intestinal irritation, dyspepsia, pyrosis, in chronic vomiting, and especially in the vomiting during pregnancy), flexile collodion (consisting of a mixture of 48 parts of collodion, 2 of Canada balsam, and of castor oil, and useful as a protecting coating for burns, ulcers, and in erysipelas); glycerines of borax, carbolic acid, gallic acid, tannic acid, and starch (which are used as local applications); various mercurial preparations, as compound ointment of mercury (which is an imitation of Scott's celebrated ointment for diseased joints), mercury suppositories (for thread worms in the rectum), and the black and yellow washes which are now for the first time made officinal, lozenges of chlorate of potash, tincture of pellitory or pyrethrum (used locally for relieving toothache), quinine pills and wine, tincture of sumbl (valuable in 20 minim doses as a nervous stimulant in typhoid fever, delirium tremens, etc.), and tincture of green hellebore, or *Veratrum viride* (which, in doses of from 5 to 20 minims, is useful in gout.

It may be proper here to make the distinction between a pharmacopœia and a dispensatory. These terms have been used indiscriminately, but there is a distinction among pharmacists, which is this: the word pharmacopœia is derived from the Greek and signifies, "I make medicine." It is strictly a collection of recipes or instructions for making various medicinal compounds, or simple preparations, which are also made under the authority of a college or body of medical men, and are termed *officinal*. A dispensatory, is a book which also treats of the preparation of medicines; but it moreover contains the natural as well as the medical history of the various medicinal substances. A dispensatory in addition to officinal preparations, may contain many others, and be published without official authority. A dispensatory is also to a more or less extent a treatise on *materia medica* (q.v.), a branch of medical science which treats of the knowledge and action of medicines, and may either treat of the action of individual medicines or embrace the whole range of the pharmacopœia, and occupy itself with the action of every article, simple, or compound, either upon a healthy or a diseased subject; that is to say, it may consider the physiological as well as the therapeutical action of medicines, therapeutics (q.v.) being that branch of the science which treats of the action of drugs as *medicines* strictly speaking, or their action in disease, for this is often much different from their action on the

*The chief continental pharmacopœias are the French, which is also used in Switzerland; the Prussian, which is mostly used in Germany and Russia; and that of Orosi, which is used in Italy.

healthy body, or their physiological action. A dispensatory is often, nay it is generally, a combination of a pharmacopœia, a materia medica, and a treatise on therapeutics, as far as the latter is not included in materia medica. This depends upon the signification placed upon the word therapeutics. Its original meaning, as derived from the Greek is "I wait upon," or "I attend upon the sick," and includes not only the action of medicines but their *mode of administration* in every respect, as regards time, frequency, or quantity, and the condition in which the patient is to be kept. This, the strict signification of the word therapeutics, is adopted by many, and of course embraces much of the *practice* of medicine. Others regard therapeutics as the science of the action of remedies only, and this is the way in which the word is generally employed. We have thus, for the sake of conciseness, briefly discussed this question under one head. The New York county and New York state medical societies in 1818 took measures for holding a convention of delegates from various state medical societies and medical colleges, which met at Washington Jan. 1, 1820. The action taken then resulted in the appearance the same year of the first *Pharmacopœia* in the United States of America, a volume of 272 pages. The convention made provision for the holding of other conventions for revision every ten years, and such conventions were held in 1830, 1840, and 1850. The convention of 1860 received delegates from the army and navy, and from various colleges of pharmacy and pharmaceutical societies. The first edition of the *United States Dispensatory* was issued in 1831. It has since that time passed through many revisions, and has become double its original size, till at the present time it is really an encyclopædia of therapeutics, pharmacy, and materia medica. Several other excellent pharmacopœias and dispensatories have been published. The American *Pharmacopœia* was first published in both English and Latin, but in 1840, and since that time, the Latin has been omitted. In 1870 several important changes were introduced into it. The terminology of chemical medicines was changed to correspond with the new nomenclature (see CHEMICAL NOMENCLATURE); the substitution of expressions of weight for those of capacity in all formulas, was adopted; and, finally, articles were added relating to the local peculiarities of climate. New preparations are, of course, continually added to the pharmacopœias.

PHAR'MACY (from the Gr. *pharmacon*, a medicine), is that department of *materia medica* (q.v.) which treats of the collection, preparation, preservation, and dispensing of medicines. It is synonymous with *pharmaceutical chemistry*.

PHARNABAZUS, b. Greece 5th c. B.C.; succeeded his father Pharnaces as satrap of the Persian provinces about the Hellespont. He assisted the Spartans in 411 in the capture of Abydos and Lampsacus, protected them after their defeat at Cyzicus in 409, but finally became hostile. In 396 he defeated an invading Spartan force under Agesilaus II., but the next year was defeated by him. Conon came to his assistance from Athens, and they sailed along the Ægæan sea, driving out the Lacedæmonians from the sea-port towns. His last known action was his unsuccessful expedition to Egypt with the Athenian Iphicrates in 377 B.C.

PHA'ROS, a rocky islet off the coast of Egypt, which Alexander the great connected with Alexandria by the Heptastadium, or Seven Furlong Mole. The light-house, at its n.e. point, commenced by Ptolemy I. and finished about 280 B.C., was looked upon as one of the wonders of the world. It seems to have been 400 ft. high, and lasted for 1600 years. The fire, constantly kept lighted on its summit, was said to be visible for 40 miles. The island of Pharos became ultimately a suburb of Alexandria by means of a street extending along the mole. After the time of Julius Cæsar it relapsed into its original condition of a mere fishing station.

PHARSA'LUS, now FERSALA, anciently a t. of Thessaly, to the s. of Larissa, on the river Enipeus, and historically notable for the great battle fought here between Cæsar and Pompey, Aug. 9, 48 B.C. Pompey had about 45,000 legionaries, 7,000 cavalry, and a great number of light-armed auxiliaries. Cæsar had 22,000 legionaries, and 1000 German and Gallic cavalry. The battle, which commenced with an attack on Pompey's left wing, ended in a complete victory for Cæsar. Pharsalus was also one of the positions occupied by the Greeks in the disastrous war against Turkey in 1897.

PHARYNGOBRAN'CHII, a sub-order of dermopterous (q.v.) fishes, characterized by respiratory processes projecting from above the pharynx into the large cavity of the mouth. The pharyngobranchii have no heart, and are the lowest in organization of all fishes. The species are very few. See LANCELET.

PHARYNGOGNA'THI, an order of fishes in the system of Müller and Owen; partly *acanthopterous* and partly *malacopterous* in the system of Cuvier; some of them also *cycloid*, and some *ctenoid*. Their common characteristic is the union of the lower pharyngeals into one bone.

PHAR'YNX (Gr.) is the name of that part of the alimentary canal which lies behind the nose, mouth, and larynx. It is a musculo-membranous sac, situated upon the cervical portion of the vertrebral column, and extending from the base of the skull to the level of the fifth cervical vertebra, where it becomes continuous with the œsophagus (q.v.) Its length is about four inches and a half, it is broader in its transverse than in its

anteroposterior diameter, and its narrowest point is at its termination in the œsophagus. Seven *foramina* or openings communicate with it, viz.: the two *posterior nares* or nostrils, at the upper and front part of the pharynx; the two *Eustachian tubes*, opening on the outer surface of the preceding orifices; the *mouth;* the *larynx;* and the *œsophagus*.

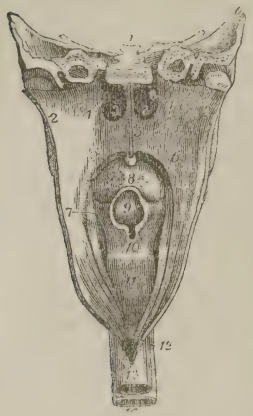

Fig. 1.—The pharynx laid open from behind:

1, a section of the base of the skull; 2, 2, the walls of the pharynx drawn to either side; 3, 3, the posterior nares, separated by the vomer; 4, 4, the extremities of the Eustachian tubes; 5, the soft palate; 6, 6, 7, 7, its posterior and anterior pillars; 8, the root of the tongue; 9, the epiglottis overhanging; 10, the opening of the larynx; 11, the posterior part of the larynx; 12, the opening into the œsophagus, whose external surface is seen at 13; 14, the trachea.—(From Wilson.)

The pharynx is composed of an external *muscular* coat; a middle *fibrous* coat called the *pharyngeal aponeurosis*, thick above where the muscular coat is absent, and gradually thinning as it descends; and a *mucous* coat, continuous with the mucous membrane of the mouth and nostrils. The muscular coat requires special notice. It is composed of a *superior*, *middle*, and *inferior constrictor* muscle on either side, together with two less important muscles, termed the *stylo-pharyngeal* and *palato-pharyngeal* muscles. When the food, after being sufficiently masticated and mixed with saliva, is thrown, by the action of the tongue, into the pharynx, the latter is drawn upwards and dilated in different directions; the elevator muscles (the stylo-pharyngeal and palato-pharyngeal) then relax, and the pharynx descends; and as soon as the morsel is fairly within the sphere of action of the constrictor muscles, they successively contract upon it, and gradually pass it onwards to the œsophagus. Independently of its importance in the act of swallowing, the pharynx exerts an influence on the modulation of the voice, especially in the production of the higher notes.

The pharynx is not so frequently a seat of disease as many other parts of the intestinal tube. In cases of diphtheria (q.v.) it is usually the chief seat of the disease. It is liable to ordinary inflammation or *pharyngitis*—an affection characterized by pain, especially in swallowing, without redness in the fauces or change of voice. Little in the way of treatment, except low diet and attention to the bowels, is required, and the inflammation usually terminates in resolution. Sometimes, however, it proceeds to suppuration, and abcesses—dangerous partly from inanition consequent on inability to take food, but chiefly from suffocation due to pressure on the larynx—are formed. These abscesses are more dangerous in the lower than in the upper part of the pharynx, and are more common in young children than in adults. The treatment consists in opening the abscess, which gives immediate relief; but the operation must be conducted with great care, and the incision made as nearly as possible to the mesial line, in consequence of the large adjacent blood-vessels.

PHASCO'GALÉ, a genus of marsupial quadrupeds, of which one species, *P. penicillata*, about the size of a rat, gray, with long soft hair, and a long tufted tail, is common in most parts of Australia, lives chiefly in the hollows of decayed trees, and preys on small animals of every kind. It is much disliked by the colonists, to whom it is known as the *tapoa tafa*, on account of its depredations in poultry-yards and larders. It is very agile and audacious.

PHASCOLOMY'IDÆ. See Wombats.

PHASE'OLUS. See Kidney-bean.

PHA'SES (Gr. *phasis*, appearance), the different luminous appearances presented by the moon and several of the planets, sometimes the whole, a part, or none, of the luminous surface being seen from the earth. The various phases of the moon, and the reasons for them, are mentioned under the article Moon. Mercury and Venus, being inferior planets, present to an observer on the earth exactly similar phases to those of the moon; but the former require, instead of a month, periods of 116 and 584 days respectively to pass through a complete series of phases. The superior planets, to a certain extent, exhibit phases, but the luminous surface, as seen from the earth, only varies from the full illumination seen when they are in conjunction with the earth to a slightly gibbous appearance, when they attain their greatest elongation; and their distance from the sun is so great in comparison with that of the earth, as to render the variation in the form of their luminous surface not observable, except in the case of Mars and occasionally of Jupiter. Galileo was the first to observe the phases of Venus, and he considered them as one of the most satisfactory proofs of the truth of the Copernican system. The great brilliancy of Mercury, and its nearness to the sun, prevented its phases from being so easily noticed, but they were at last observed by Masius, and since by many other astronomers. The term phases is frequently applied to designate the successive stages of an eclipse, lunar or solar.

PHASIAN'IDÆ, a family of gallinaceous birds, including pheasants, argus, Macartney cock, fowls, impeyans, tragopans, etc.; its limits, however, being extended by some ornithologists to include peacocks and turkeys (*pavonidæ*), which differ from it by no very considerable character. The hind toe is placed higher on the tarsus than the front toes, so that only the tip touches the ground. The wings are short.

PHA'SIS, a river in Colchis, now called the RION. It rises in the mountains of Caucasus, flows in a generally western direction, and enters the Euxine near the ancient city of Phasis.

PHAS'MIDÆ (Gr. *phasma*, a specter), a family of orthopterous insects, allied to *mantidæ*, but differing in having the fore-legs similar to the other legs, and used like them for locomotion, not for combat and prehension, in the want of stemmatic eyes, and in the similarity of the first joint of the thorax to the other joints. They are insects of very extraordinary appearance, inhabiting topical countries, and spending their lives upon trees and shrubs, the tender shoots of which they devour. Some of them resemble green leaves; some resemble brown and withered leaves; whilst others, wingless, or nearly so, and with much elongated bodies—one species nine inches in length—resemble dried twigs. To these peculiarities they owe their safety from enemies, eluding observation, for their motions are sluggish. Some are known as leaf insects, specter insects, walking-sticks, etc. The larvæ of the phasmidæ much resemble the perfect insect.

PHEAS'ANT, *Phasianus*, a genus of gallinaceous birds of the family *phasianidæ;* having a rather short strong bill, a little curved; the cheeks and skin surrounding the eyes destitute of feathers, and warty; the wings short; the tail long, its feathers so placed as to slope down, roof-like, on either side, the middle feathers longest; the tarsus of the male furnished with a spur. The males of all the species are birds of splendid plumage; the females have shorter tails and dull or somber colors. There are numerous species, natives of the warm and temperate parts of Asia. The COMMON PHEASANT (*P. Colchicus*) is said to have been brought from the banks of the Phasis, in Colchis, to the south of Europe, at a very remote period, its introduction being ascribed in classic legend to the Argonauts. From the Phasis it derived its Greek name *phasianos*, the origin of its name in English and other modern languages. It was soon naturalized in Europe, and is now diffused over almost all the temperate parts of it. The date of its introduction into Britain is not known, but was certainly before the end of the 13th c.: it has long been plentiful in plantations and game-preserves, and has been introduced into almost every part of the country suitable to its habits. The abundance of pheasants in Britain, however, is to be ascribed chiefly to careful game-preservation, without which the race would in all probability soon be extirpated. No kind of game falls so easy a prey to the poacher.

A minute description of the common pheasant is unnecessary. The head and neck of the male are steel-blue, reflecting brown, green, and purple in different lights; the back and wings exhibit a fine mixture of orange-red, black, brown, and light yellow; the breast and belly are golden-red, each feather margined with black, and reflecting tints of gold and purple. The whole length of a male pheasant is about 3 ft., of which the tail often measures 2 feet. The entire length of the female is about 2 feet. The general color of the female is pale yellowish-brown, varied with darker brown, the sides of the neck tinged with red and green. The ordinary weight of a pheasant is about 2 pounds and a half; but when pheasants are abundantly supplied with food, and kept undisturbed, they are sometimes 4 pounds or 4 pounds and a half in weight. The pheasant, unlike the partridge, is polygamous.

The nest of the pheasant is on the ground, and is a rude heap of leaves and grasses, in which eleven or twelve olive-brown eggs are laid. But in the half-domesticated state in which it exists in many English preserves, the pheasant does not pay that attention to its eggs and young which it does when more wild, and not unfrequently continues to lay eggs for a considerable time, like the domestic fowl, the eggs being removed by the gamekeeper, and hatched by hens, along with eggs from nests found among clover and hay in the season of mowing. Very young pheasants must be carefully supplied with ants, eggs, maggots, etc., and the whole difficulty of rearing them is in their earliest stage. Pheasants feed very indiscriminately on berries, seeds, roots, young shoots of plants, worms, insects, etc. Beans, pease, corn, and buckwheat are frequently thrown for them in open places in woods; and they scrape up bulbous and tuberous roots in winter. They roost in trees at no great height from the ground, and poachers sometimes capture them by burning sulphur below them. During the molting season, they do not ascend trees to roost, but spend the night on the ground, when they fall a ready prey to foxes. They are fond of woods with a thick undergrowth, in which, when disturbed, they naturally seek shelter, running whilst it is possible, rather than taking flight. The male pheasant takes flight much more readily than the female, which, apparently trusting to her brown color to escape observation, often remains still until the sportsman is almost upon her. The males and females do not associate together except during the breeding season, but small numbers of one sex are often found in company. The "short crow" of the males begins to be heard in March. In England and Scotland pheasant-shooting legally begins on Oct. 1, and ends on Feb. 3. The pheasants turned out from the gamekeeper's breeding-yard into a preserve, are in general supplied with abundance of food

during winter, and come to the accustomed call as readily as any kind of poultry, so that the sportsmanship of a *battue*, in which they are killed by scores or hundreds, is of the lowest kind. It is scarcely necessary to mention that the flesh of the pheasant is in very high esteem for the table.

The female pheasant, in old age, or when from any cause incapable of the functions of reproduction, sometimes assumes the plumage of the male. The pheasant exhibits a remarkable readiness to hybridize with other gallinaceous birds. A hybrid between it and the common fowl is not unfrequent, and is called a *pero*. Hybrids between the pheasant and black grouse have also occurred; and hybrids are supposed to have been produced between the pheasant and guinea-fowl, and the pheasant and turkey. None of these hybrids, however, have ever been known to be fertile, except with one of the original species. On the contrary, the offspring of the common pheasant and the RING-NECKED PHEASANT (*P. torquatus*) is perfectly fertile, a circumstance which is urged in argument by those who regard them as mere varieties of one species. The ring-necked pheasant is now almost as plentiful in Britain as the common pheasant. it is a native of the forests of India and China, and is said not to breed with the common pheasant in a truly wide state, but in Britain they readily intermix. It is distinguished by a white ring almost surrounding the neck, and is of smaller size than the common pheasant, somewhat different in markings, and has a shorter tail.—The BOHEMIAN PHEASANT is another variety of a silvery-gray color.—White pheasants are of not very unfrequent occurrence.—Of other species of pheasant may be mentioned DIARD'S PHEASANT (*P. versicolor*), a native of Java, in which the prevailing color is green; and REEVES'S PHEASANT (*P. Reevesii*), a native of the n. of China, in which white is the prevailing color, and the tail is of extraordinary length, so that a bird not larger than the common pheasant measures 8 ft. in entire length. Of somewhat different type, and more nearly approaching to the common fowl, are the GOLDEN PHEASANT (*P. pictus*, or *thaumalia picta*) and the SILVER PHEASANT (*P.* or *gallophasis nycthemerus*), both natives of China, and both hardy birds, the introduction of which into British preserves has been attempted with good prospect of success. Both have long been kept in a state of domestication by the Chinese. The golden pheasant is one of the most splendid of the tribe. It has a fine crest, and a ruff of orange and black, capable of being erected at pleasure. The tail is very long. The crest and ruff are held in great estimation by anglers for making artificial flies.—LADY AMHERST'S PHEASANT (*P.* or *thaumalia Amherstiæ*) is a native of China, resembling the golden pheasant, and with an extremely long tail.—The silver pheasant is one of the largest and most powerful of the tribe, and very combative, driving the common pheasant from preserves into which it is introduced. The prevailing color of the upper parts and tail of the male is white, finely penciled with black.

PHEASANT-SHELL, *Phasianella*, a genus of gasteropodous mollusks of the family *turbinidæ*, of which the shells are much valued for their beauty, and when they were rare in collections, were sometimes sold for extraordinary prices. They are now comparatively cheap and plentiful, being found in great numbers on some parts of the Australian coast.

PHEIDIAS. See PHIDIAS.

PHELPS, a co. in s.e. central Missouri, watered by Maramee and Gasconade rivers, and Bourbeuse creek, crossed by the St. Louis and San Francisco railroad, about 640 sq. m.; pop. '90, 12,636, chiefly of American birth. The surface is hilly, with many low valleys, and heavily wooded. The soil is fertile. The principal productions are corn, wheat, tobacco, oats, and hay. Iron and lead are found. There are flour, saw, iron, and woolen mills. Co. seat, Rolla.

PHELPS, a co. in s. Nebraska, bounded on the n. by the Platte river; 576 sq.m.; pop. '90, 9869, chiefly of American birth. Co. seat, Holdrege.

PHELPS, ALMIRA (HART LINCOLN); b. Berlin, Conn., 1793; daughter of Samuel Hart, a descendant of the Rev. Thomas Hooker; educated under the direction of her sister Mrs. Emma Willard; became principal of the Sandyhill (N. Y.) seminary for girls. In 1817 she married Simeon Lincoln, editor of the *Connecticut Mirror*. After her husband's death in 1823 she conducted the seminary in Troy, N. Y., jointly with her sister. In 1831 she married the Hon. John Phelps of Vermont. In 1830 she returned to her favorite vocation, and took charge of a seminary at West Chester, Penn., and subsequently taught in Rahway, N. J. In 1841–56 she conducted the Patapsco institute, for 7 years associated with her husband, who died in 1848. She edited the *Patapsco Magazine* and published books on chemistry, geology, and botany for the use of young students, and lectures on the sciences, translations, etc. She d. 1884.

PHELPS, ANSON GREENE, 1781–1853; b. Conn.; removed to Hartford at the age of 18; established himself in the saddlery business, which he had learned. In 1815 he removed to New York, and engaged as a merchant in tin plate and heavy metals. He accumulated a large fortune, partly by investments in real estate, and devoted a large part of his property to benevolent objects. He was president of the blind asylum, the American board of commissioners for foreign missions, and the New York branch of

the colonization society. He bequeathed to religious and charitable institutions $371,000. and entrusted to his son a fund of $100,000, to dispose of in charity.

PHELPS, Austin, d.d., b. Mass., 1820; graduated at the university of Pennsylvania in 1837; studied theology at Andover and New Haven; was pastor of Pine street Congregational church, Boston, 1842–48; became Bartlett professor of sacred rhetoric in Andover theological seminary in 1849, which position he retained until 1879—having retired from full discharge of its duties because of impaired health. He is the author of *The Still Hour; The New Birth;* and was one of the compilers of the *Sabbath Hymn Book.* He was an exceedingly careful writer, a clear thinker, an impressive preacher. His faultless taste in English style, and the deeply devotional spirit of his writings, with his evangelical liberty in theology, gave great value to his training of successive classes of students for the ministry. He died in 1890.

PHELPS, Edward John, ll.d., b. Vt., 1824; educated at Middlebury coll., Vt.; was appointed second controller of the treas. by Pres. Fillmore; practised law in New York, and Burlington, Vt. Originally a whig in politics, he became a democrat prior to the civil war. He was elected president of the American bar association, and was appointed Kent professor of law at Yale college, both in 1881; and was appointed U. S. minister to Great Britain in 1885, and one of the counsel for the United States before the Bering Sea arbitration tribunal in 1892.

PHELPS, Elizabeth Stuart, 1815–52; b. Mass., daughter of Prof. Moses Stuart of Andover theological seminary, and wife of Prof. Austin Phelps of the same institution. She published *The Sunny Side; Peep at Number Five; Tell-Tale; Angel over the Right Shoulder;* and *The Last Leaf from Sunny-Side.* Her literary work, published and unpublished, showed some inheritance of her father's genius.

PHELPS, Elizabeth Stuart; b. Mass. 1844; daughter of Prof. Austin Phelps of Andover. She has published *Ellen's Idol; Up Hill; Tiny; Mercy Gliddon's Work; The Gypsy Series,* 4 vols.; *Tiny's Sunday Night; I Don't Know How; Gates Ajar; Hedged In; Men, Women, and Ghosts; The Silent Partner; The Story of Avis; Beyond the Gates; Dr. Zay; The Madonna of the Tubs; A Singular Life; The Supply at St. Agatha's; Chapters from a Life,* etc. Her books have gained great popularity—*Gates Ajar* reached 20 editions in a year. They show original thought—which does not need to seek the peculiarity of expression which occasionally appears; a sympathy with the perplexed and baffled; keen and quick perceptions, with rapid framing of conclusions; moral earnestness which leads to a certain unusual daring; and a deep longing to solve some intellectual problems and redress some social wrongs which the world has failed to deal with aright. She was married, 1888, to Rev. Herbert D. Ward, in collaboration with whom she published *The Master of the Magicians* (1890), etc.

PHELPS, John Smith, b. Simsbury, Conn., 1814. He graduated at Trinity coll., Conn.; adopted law as a profession, and settled in Springfield, Mo., 1837; was elected to the legislature, 1840, and to Congress, 1844, serving nine consecutive terms. He fought in the union army, and was appointed military governor of Arkansas, 1862. He was elected governor of Missouri by the democrats, 1876. He d. in 1886.

PHELPS, John Wolcott, b. Vt., 1813; graduated at West Point, 1836; received his 2d lieutenant's commission in the 4th artillery and served in Florida, and in Mexico, where he distinguished himself in the battles of Contreras and Churubusco. He was made a member of a board for instruction in heavy artillery practice, and in 1850 was made captain and placed in command at Fort Brown, Texas, where he was instrumental in breaking up the filibustering expedition against Mexico. In 1859 he resigned and became a resident of Brattleboro, Vt. At the outbreak of the civil war he became col. of the 1st Vermont volunteers, was made a brig.gen. of volunteers, and attached to Butler's New Orleans expedition. He resigned in 1862 on account of Gen. Butler's dissatisfaction with his conduct in drilling and enlisting negro soldiers—a policy afterward adopted. He continued to reside in Brattleboro, was an officer of the Vermont Historical society, and wrote *Secret Societies, Ancient and Modern.* He d. 1885.

PHELPS, Moses Stuart, ph.d., 1849–83; b. Andover, Mass.; son of Prof. Austin P., and grandson of Prof. Moses Stuart; graduated at Yale coll., 1869; tutor at Yale, 1873–76; instructor in mental philosophy at Middlebury coll., 1876; went to Germany and studied at the univ. of Berlin, 1876–77, taking the degree of ph.d.; prof. of mental and moral philosophy at Smith coll., Northampton, Mass., from 1878 to the time of his death. His death occurred by accident during his summer vacation.

PHELPS, Oliver, 1749–1809, b. Conn.; engaged in business at Suffield, Conn., and Granville, Mass., and acquired a considerable fortune. In the revolution he held the position of commissary general. In 1788 he and Nathaniel Gorham bought from the state of Massachusetts over 2,000,000 acres of land now comprised in Ontario and Steuben counties, N. Y.; and in 1795 with several associates he bought the tract in Ohio afterward known as the western reserve, including about 3,300,000 acres. His system of land surveys and sales was very complete, and has largely been followed in laying out the public lands. He settled in Canandaigua, was member of congress, 1803–5, and for some years judge of the U. S. circuit court.

PHELPS, WILLIAM WALTER, b. N. Y., 1839; educated at Yale, where he graduated in 1860. He studied law at the Columbia law school; began practice in New York city, and afterward occupied positions of responsibility in several banks and other corporations. In 1872 he was elected a member of the Yale corporation. He was sent to congress from New Jersey in 1873, but failed to receive a re-election in 1875. He was minister to Austria, 1881–82; a representative in congress in 1883–89; U. S. minister to Germany in 1889–93; and a judge of the New Jersey court of errors and appeals from 1893 till his death in 1894. He distinguished himself as an advocate of a protective tariff; and during the campaign of 1884 was one of the stanchest supporters of James G Blaine for president.

PHENICIA (Gr. *Phoinike*, derived either from *phoinos*, purple, or *phoinix*, palm-tree—both designations descriptive of the chief produce of the country; the Hebrew term *kenaan*, lowland, referring to its physical condition) is the name given by the Greeks and Romans to a certain territory situated about 34°—36° n. lat., bounded by the Mediterranean on the w., by Syria to the n. and e., and Judæa to the south. Except where the Mediterranean set a natural boundary, the frontiers differed widely at different periods, n., s., and e., according to the gradual rise and decline of the country. Its length may be said to have been about 200 m., while its breadth never exceeded 20 m., making a total of about 2,000 sq. miles. We may here mention some of the products of the soil, the exportation of which, to a certain extent, laid the foundation of her greatness. Pine, fir, cypress, cedars, terebinths, palm and fig-trees, sycamores, olive-trees, and acacias, crown the heights; while wheat, rye, and barley are found in the lower regions, together not only with ordinary fruit, but also with apricots, peaches, pomegranates, almonds, citrons, sugar-cane, grapes, bananas—all growing luxuriantly, and forming a forest of finely-tinted foliage. The land further yields silk and cotton, indigo and tobacco; and the modern inhabitants of Shur, like their forefathers of old, drive a profitable traffic with the produce of Mount Lebanon, its timber, wood, and charcoal. Flocks of sheep and goats, and innumerable swarms of bees, supply meat, milk, and honey. The sea furnished shoals of fish, and mollusks for the purple of Tyre. There are no precious metals found anywhere in Phenicia; but it is rich in iron, and the stone-quarries of Lebanon were already worked in Solomon's time.

The question of the origin of the Phenicians is one which has hitherto not been solved satisfactorily. Their own account, as preserved by Herodotus, speaks of their having immigrated from the "sea called Erythra;" a report further confirmed by another passage in his history, and by Justin. Strabo speaks of two islands in the Persian gulf, called Tyros or Tylos and Aradus, in which temples were found similar to those of the Phenicians; and the inhabitants of these cities stated that the Phenicians had left them in order to found new colonies. The Erythrean sea, in its widest sense, extends from the eastern shores of Egypt to the western shores of India; and since Genesis calls Canaan, the founder of the race, a descendant of Ham, not of Shem, some investigators have come to the conclusion that the Persian or Arabian gulf is the original home of the Phenicians. Against this notion, however, weighty arguments have been brought forward, both from the genuine traditions of the people itself, as preserved, not in a corrupted Greek shape, but in their myths, in the biblical accounts, in their language, which even in its very oldest remnants (Canaan = lowland; Sidon = fishing-place; Giblites = mountain-people) is purely Semitic. It would be vague to speculate on the time at which the first Phenician settlers entered the country: as vague as to conjecture—the Erythrean sea being put out of the question—whence they came. So much seems certain, that they did not enter it from one region, but from several sides, and at various periods; and that only very gradually, in the course of long pre-historic centuries, they grew into one nationality, embracing the tribes that inhabited the sea-coast, or Phenicia proper, from Sidon to Gaza, and the cities n. of Sidonia. The latter term included the many separate states originally formed by the various *gentes*, who again, originally, had their own political existence, laws, and even worship. Gradually, however, the larger communities extended their rules over the smaller ones, or rather combined with them for the formation of a more imposing and important state, into which the different states were merged, without, however, giving up their own individual existence or cultus entirely. The most important of these special tribes or states were the inhabitants of Sidonia—a term, however, expressive both of the inhabitants of the city and of the whole country—the Tyrians, whose settlement, according to their own traditions, was prior to any other Phenician settlement (about 2,750 B.C.); and Aradus, founded, according to the native traditions, by Arvadi, "the brother of Sidon." From these three tribes—of the Sidonians collectively—are to be distinguished the Giblites with their two sovereignties of Byblus and Berytus, who differed in many respects from the former, and who, it may be presumed, formed at first the ruling state of Phenicia, until they were brought under Sidonian dependency. Several smaller tribes or states are mentioned in scripture—Arke, Sin, Hamath, etc.—but little is known about them.

Of the government and internal constitution of these states or cities, we know next to nothing. There were hereditary monarchs ruling over Sidon, Tyrus, Byblus, Berytus, and Aradus, for whose confirmation, however, the assent of the people was necessary in all cases. By the side of the king stood a powerful assembly, composed of representatives of the old aristocratic families of the land, whose numbers differed at various periods. When Tripolis was founded by Tyrus, Sidon, and Aradus, as a place of joint

meeting for their hegemony, every one of these cities sent 100 senators to watch her special interests at the common meeting; and the senate of Sidon seems, in the 4th c. B.C., at least, to have consisted of 500—600 elders, some of whom were probably selected more for their wealth than for their noble lineage. The king sometimes combined in his person the office of high-priest. The turbulent seething mass of the people, consisting of the poorer families of Phenician descent, the immigrants of neighboring tribes, the strangers, and the whole incongruous mass of workmen, tradespeople, sailors, that must have abounded in a commercial and maritime nation like the Phenicians, and out of whose midst must have arisen at times influential men enough—was governed, as far as we can learn, as "constitutionally" as possible. The unruly spirits were got rid of in Roman fashion somehow in the colonies, or were made silent by important places being intrusted to their care, under strict supervision from home. Only once or twice do we hear of violent popular outbreaks, in consequence of one of which it was mockingly said that Phenicia had lost all her aristocracy, and what existed of Phenicians was of the lowest birth, the offspring of slaves. As the wealth of all the world accumulated more and more in the Phenician ports, luxury, and too great a desire to rest and enjoy their wealth in peace, induced the dauntless old pirates to intrust the guard of their cities to the mariners and mercenary soldiers, to Libyans and Lydians—"they of Persia and of Lud and of Phut," as Ezekiel has it; although the wild resistance which this small territory offered in her single towns to the enormous armies of Assyria, Babylonia, and Greece, shows that the old spirit had not died out.

The sources for the early Phenician history are of the scantiest description. Of the annals and state documents which filled the archives of every large city, nothing has survived except a very doubtful record, which Sanchuniathon (q.v.) is said to have compiled, about 1250 B.C., in Phenician from official documents, and which was translated into Greek by Philo of Byblus, and a fragment of which is preserved by Eusebius. The Bible, principally Ezekiel, Menander of Ephesus, and Dius, a Phenician, who wrote the history of Tyre from Tyrian annals, fragments of which are extant in Josephus and Syncellus, Herodotus, Diodorus, Justinus, and others, together with a very few notes scattered throughout the church fathers, contain the sum of all our information. Four great periods, however, are clearly distinguishable in the history of ancient Phenicia. The first would comprise the earliest beginnings and the gradual development of the single states and tribes, from their immigration to the historical time when Sidon began to take the lead, or about 1500 B.C. The second period dates from the conquest of Palestine by the Hebrews. Sidon had then become already the "first-born of Kanaan," as Genesis has it, or "Sidon Rabbah," the great Sidon. The flourishing state of its commerce and manufactures appears likewise from several passages in Homer. The silver vase proposed by Achilles as a prize in the funeral games in honor of Patroclus, was a work of the "skillful Sidonians;" the garment Hecuba offers as a propitiatory gift to Minerva was the work of Sidonian women. The gold-edged silver bowl given to Telemachus by Menelaos, Hephaistos had received from the king of the Sidonians. Ulysses is left on the island of Ithaca by the Phenicians, who sail away to "well-peopled Sidonia." The gradual ascendency of the rival city of Tyre marks the beginning of the third period, in which Phenicia reaches the height of its power, in which her ships covered all the seas, her commerce embraced the whole known earth, and her innumerable colonies flourished far and near. The first historically-recorded item of Tyre's activity is her foundation of Gades, a few years before that of Utica, in 1100 B.C. The reason of the sudden greatness of Tyre is to be found in the defeat of the Sidonians by the king of "Askalon"—a term probably meant to represent the whole pentapolis of Philistia—about the year 1209; in consequence of which, the principal families of Sidon "emigrated in their ships to Tyre, which (viz., the Island-city) they founded." In the 11th c., in the time of Samuel, "the princes of the Tyrians" are already spoken of instead of the Sidonians, as the representatives of Phenicia. During the reigns of David and Solomon—under Hiram (980–917)—the friendliest relations existed between the two nations, both in the full bloom of their power. Each country needed what the other could supply. Hence their close alliance, which led even to common commercial enterprises in ships built by Solomon, the supercargoes of which belonged to him, while the mariners and pilots were Hiram's.

By this time, Phenician colonization had reached its utmost extent. In the space of three centuries (1300–1000), the Phenicians had covered all the islands and coasts of the Mediterranean with their forts, their factories, and their cities; and their ships, which plowed the main in all directions, everywhere found their own ports. They had colonized Cyprus, thus commanding the waters of the Levant and the coasts of Syria and Cilicia. Kithion, Amathus (Hamath), Karpasia, Paphos, with its magnificent temple of Ashera, Keryneia, and Lapothos, were some of their principal settlements in those regions. Northward, on the coast of Cilicia, they founded the cities of Myriandros, Tarsos, and Soloi. Migrating to the west, they took possession of Rhodes, Crete (cf. the myth of Zeus and Europe), Melos, Thera, Oliaros (near Paros), and Cythera, on the coast of the Peloponnesus. To the east of the Ægean, we find them at Erythræ, and further, as masters of the islands of Samothrace, Lemnos, and Thasos with its wealth of gold mines. The Ægean sea, with all its islands, being in their hands, they sailed thence further west, to Sicily, where they settled at Motye, on the extreme w. point; founded Rus

Melkarth, in the s. (Heraclea Minoa); in the n., Machanath (Panormos, Palermo), and further, Melite (Malta) and Gaulos. They owned Caralis (Cagliari) in Sardinia, Minorca, Iviza (Ebusos), Elba; on the opposite, or African coast, Hippo, Utica, Hadrumetum, Leptis, and some minor island states. From Sardinia and Minorca, the indefatigable mariners went still further w.—through the strait of Gibraltar to Tarshish (the California of those days) or Spain, where they founded Gadeir or Cadiz, and in the s., Karteja, Malaka, and Abdarach. From here, having colonized well-nigh the whole of the Spanish coast, they went northward to the tin islands (Scilly isles), and to Britain herself. And while they thus explored the regions of the Atlantic, their alliance with the Hebrews had permitted them to find the way to the Indies by the Red sea.

The impulse given to industry and the arts by this almost unparalleled extension of their commercial sphere, was enormous. Originally, exporters or traders only for the wares of Egypt and Assyria, they soon began to manufacture these wares themselves, and drew the whole world into their circle of commerce. As to the early and most extensive commercial intercourse between Phenicia and Greece and her colonies, nothing can be more striking than the circumstance of nearly all the Greek names for the principal objects of oriental commerce being Phenician, or rather Semitic—identical almost with the terms found in the Old Testament. Thus, of spices—myrrh, cassia, cinnamon, galbanum, narde, aloe, crocus, nitron, balsam, etc.; of jewels and precious stones—sapphire, jasper, smaragdos; of fine materials, and garments, byssus, karpasos, sindon, etc.; musical instruments—nabla, tympanon, sambyke, etc.; oriental plants, vessels, and even writing implements. The wealth of silver, iron, tin, and lead was chiefly got from Tartessus. The descriptions of the abundance of precious metals there verge on the fabulous. Thus the Phenicians are supposed to have made even their anchors of silver, when they first discovered the country, not knowing how to stow away all the silver in their vessel. What must have been the state of these mines is clear from the fact that, even in the Roman time, 40,000 men were constantly employed as miners, and the state received a clear revenue of 20,500 drachmas daily. The "Fortunate islands," which, according to Diodorus, they discovered after many days' sailing along the coast of Africa, beyond the strait of Hercules, and which to judge from the name Purpurariæ given to some islands off the coast of Mauritania, would seem to have been the Canaries, yielded them the shell-fish purpura, so useful for their dyeing manufactories. Besides their wholesale commerce carried on by fleets and caravans, they also appear to have gone about the interior of Syria and Palestine retailing their home or foreign produce.

Although the Phenicians were erroneously believed, by the western tribes, to manufacture all the wares in which they dealt themselves, yet no inconsiderable number of them was really their own work. None of their manufactures, however, stood in so high repute throughout antiquity as the purple dye prepared from the muricidæ, a shell-fish of its coast; and none excelled more in it than the Tyrians. Purple was an almost indispensable luxury of antiquity, particularly in Asia. In temples and palaces for gods and men, purple garments, hangings, curtains, and veils were needed; and Alexander the great found in Susa alone a store of purple worth 5,000 talents. Sidon's principal production was glass—invented there, it was said, by accident; but probably the invention was derived from Egypt, where it was in use long before; the Phenician glass, however, was always supposed to be the best. The Sidonians knew the use of most of our own contrivances—the blowpipe, the lathe, and the graver. Hardly less great was the fame of Phenician metallurgy. Their mining operations in the Lebanon and Cyprus, where they dug for copper; in Thasos, where, according to Herodotus, they overturned a whole mountain in searching for gold; but more particularly in Iberia, where at first silver was so abundant that hardly any labor was required to obtain it—were stupendous; and the minute description of the mining process contained in Job (chap. xxviii. 1–11) has probably been derived from a sight of Phenician mining-works. That they well understood how to work the metals thus gained, has been observed already. The art of founding brass must, indeed, have reached a high perfection to enable Hiram Abif to execute such works for Solomon's temple as they are described in the Bible. No less were they familiar with the art of imitating precious stones, and coloring glass by means of metallic oxides. To Sidon is further attributed the pre-eminence in the glyptic and plastic arts; and the artists sent by Hiram to Solomon were skillful workers in gold and silver, in brass, in iron, in purple and in blue, in stone and in timber, in fine linen, and the engraving of precious stones. Their architecture seems to have been of a Cyclopean nature. Their vessels, originally simple rafts, gradually developed—with the aid of the Lebanon, which afforded inexhaustible supplies of timber, and Cyprus, which possessed all the materials necessary for fitting up a ship, from the keel to the sails—into a first-rate fleet, consisting of round ships, or gauli, for short or coasting voyages; war-galleys, or triremes; and fifty-oared craft, long in build, and adapted for rapid sailing or rowing. The internal arrangement of these vessels was perfect, and excited the wonder and admiration of the Greeks, by their being so splendidly adapted at once for navigation, freight, and defense. Their extraordinary three years' voyage of discovery, undertaken in the service of Necho, round Africa, going out of the Red sea, and returning by the way of the strait's mouth, is as well known as their voyages in the service of Solomon.

The golden age of Phenicia, during which her colonies, her manufactures, and her commerce were in this most brilliant phase, seems to have waned simultaneously almost

with that of Judea. As Solomon in the latter, so does Hiram in the former, mark the end of that peace and happiness which had made their countries rich and glorious, as no other country of their day. According to a fragment preserved in Menander, Hiram was followed by his son Baleastartus, who died after a short reign of seven years, in 940 B.C., and a long series of political calamities and civil wars ensued. The last of Hiram's sons, Pheletus, fell, in 898, by the hands of Ithobaal, the priest of Astarte, into whose family now passed the kingdom of Tyre. He is the Ethbaal mentioned in Scripture as the father of Jezebel, and father-in-law of Ahab; and a peculiar coincidence is the simultaneous mention of the three years' drought in Judea (to which an end was put by Elijah's prayer) and in Phenicia, where relief was obtained by Ithobaal, who seems to have stood in the odor of sanctity. It was during this unhappy period that the celebrated Elissa, better known as queen Dido (q.v.), fled, together with some of the most aristocratic families of Sidon, to Libya, where they founded a new city (Kartachadata = Carthage), near the spot of an ancient Sidonian settlement, about 813 B.C. The fourth and last period of Phenician history may be dated from the middle of the 8th c., when Shalmaneser, the king of Assyria, invaded Phenicia, and besieged Tyre for five years, but without result; and there is every reason to believe that the peace concluded at the end of this period was very favorable to Tyre. But soon afterwards, Phenicia was drawn into the struggle for the supremacy then raging between Chaldea and Egypt, and was conquered by the former power. A further calamity befell Phenicia at the hand of Pharaoh-Apries, who anticipated Nebuchadnezzar's intended attack on Egypt by destroying the Phenician fleet, conquering the country, and pillaging it. These calamities produced a series of internal troubles, in consequence of which the constitution was constantly changed; and we hear now of a series of kings, and now of provisional *suffetes*—all their respective reigns, however, being of very brief duration. From that time forward, and even before the special histories of Sidon and Tyre, which alternately possessed themselves of the hegemony of Phenicia, constitute also the history of the country itself, and to these two cities we refer for what momentous events took place in the latter days of the once mighty empire. The battle on the Issus terminated even the shadow of Phenicia's independent existence, and it shared the fate of Alexander's vast empire. In 65 B.C. it became, under Roman dominion, part of Syria, and has since shared her fate for good or evil. See SYRIA, SIDON, TYRE, CARTHAGE.

Religion.—With regard to the religion of the Phenicians, its real character has yet been imperfectly expiscated. Deprived of all original and direct information on the subject, we have to cull what scanty notices we may from the works of Greek and Latin writers, or to gather knowledge from some vague allusions contained in the Bible. Not a scrap of native literature has been allowed to survive; and the supposed extracts from a Greek version by Philo of Sanchuniatho's Phenician works, which we find in Eusebius—hitherto our chief source of information—must be used with more than an ordinary degree of caution. See SANCHUNIATHON. We shall, therefore, without entering into futile speculations, confine ourselves to a few general and well-ascertained facts; premising, however, that Phenician theology is far from being a hopeless province, whatever it may appear now. Excavations are on foot in all directions, both in the mother-country and in the colonies, and new discoveries are being brought to light constantly.

The religion of the Phenicians was, like all ancient Semitic religions—except that of the Hebrews—a kind of pantheistic worship of nature. While monotheism, with the descendants of Abraham, assumed a supreme power within nature, which, according to its own free will, creates and destroys, the rest of the east assumed a dualism: two elements, a male and female; or two highest deities, one of whom begets, and has the power to destroy, and the other conceives and bears. These two supreme beings were sometimes merged in one deity, with male and female attributes, which spread out into immense ramifications: representatives now of the general powers of nature, now of the particular phenomena in nature, or the life of men. They had deities who ruled over the stars, the elements, the seasons; over special localities, or over certain phases of life. No nation of antiquity perhaps possessed a more endless pantheon than the Phenicians: a circumstance easily explained by their peculiar position and relations. Consisting originally of a variety of tribes, each of whom had had their own special deities—although the supreme *numen*, or the principle of their chief deity, was probably the same with all—those Phenicians who dwelt in the n. differed in some respects, such as the names and attributes of certain gods, from those of the south. Besides this, it must not be forgotten that the period of Phenician history ranges over 2,000 years, and their political career, as well as their commerce, brought them in close and constant contact with nearly all the civilized nations of the then known world; and being both superstitious (as sailors and traders are prone to be), and possessed of an adaptibility to which partly they owed their success in other respects, they easily, if not greedily, received into their wide pantheon those who, albeit the special national gods of others, or because of this very reason, could either harm or benefit them. It may be also that a certain easy nonchalance about these things, such as the wealthy and aristocratic classes displayed in ancient Rome and elsewhere, and the interests of the priests, who received very considerable tithes of every sacrifice (oddly enough our information on that point leaves nothing to be desired), went hand in hand to favor the gradual introduction of as many gods and goddesses as pleased the herd. Their proper divisions, however, their real names and

derivations, and the history and time of their nationalization, are things which will forever continue to puzzle investigators.

Setting aside such more or less vague and undefined names of deities as were common to the whole Semitic stock, and as they are found in the Hebrew records—like *El* (mighty one), or (in plural) *Elim; Ollonim* [*Elyon*] (the most high); *Adon* (lord); *Melech* [*Moloch*] (king); etc.—we find in the first rank of gods (of Tyre and Sidon) Baal (q.v.) and Astarte (q.v.). Baal again occurs in two different characters, as it were—as *Baalsamin* (lord of heavens), the highest god ruling over the universe, the Zeus Olympios, and Jupiter Optimus Maximus; and as *Baal Melkarth*, the special national numen. Baalsamin is originally identical with the Babylonian Bel or Baal. The third supreme Tyrian goddess was Astarte, worshiped as the very counterpart of the Sidonian *Astarte*. While the latter was considered a pure virgin, whose emblem was the moon, the former (the biblical Ashera) was propitiated (as Venus, goddess and planet) by prostitution. The Tyrian Astarte was principally known under the name of Tanis (q.v.), the Assyro-Persian Tanais, and was married to Baalsamin, and also to Adonis, and bore altogether the character of a goddess who delighted in chastity.

The principal deities of northern Phenicia—the non-Sidonian tribes—consisted of a different trias—*El, Baaltis*, and *Adonis*. The first was the supposed founder of the two oldest Phenician cities of Byblus and Berytus, and corresponded to (being originally, perhaps, identical with) both Baalsamin, as the highest deity, and Melkarth, as the special god of Tyre. Baaltis, Beltis (my lady—Aphrodite), worshiped at Byblus, Berytus, Aphaka, Arke (Architis), etc., was joined to Adonis (q.v.), whose cultus had been imported from Assyria, and is therefore unknown in the more ancient Phenician colonies, in Africa and Spain. Byblus called him Adonis Ganas, or Ganan (perhaps Gaavan, the exalted); near Byblus, we find him worshiped as Elyon (the highest); as Esmun in Bertyus, and perhaps also under the name of Memnon, at Apamea, where an annual morning-festival was celebrated in his honor; further, near the river Bandas at Paltos; and at the river Belus. As Serach (the brilliant) in Phenician, and Kharush (the sun) in Persian, he appears to have had some relation to the star-and-planet worship which became, under Assyrian influence, a prominent feature of the Phenician religion.

Besides these more or less localized gods and goddesses (*dii majores*), a certain number of deities—states and country deities—were worshiped in common by all Phenician states. They were called the children of Sadik (the just), or the Children, or the Patæki (descendants of Phtha), or the eight Kabiri (strong ones). They are the maritime gods, and their images were placed on the prows of Phenician ships. As protectors of navigation they are identified with the Dioscuri; and again as representatives of heat, breath, and life, they received the names of Lares and Penates. Their individual names are not generally mentioned; they seem (cf. Emun = eighth) to have been merely counted. Their mode of worship was most mysterious—as indeed some of the earliest mysteries were closely connected with it.

Besides these they also worshiped certain phenomena, personified attributes, and qualities. Their planetary divinities were the Sun and his four horses—to whose worship belongs, among others, to a certain extent the annual festival of the resurrection of the (Tyrian) Herakles, under the emblem of a column in the form of a rising flame (Chaman); the Moon with her chariot drawn by white bulls; the planet Mars (Aziz or Nergal); Jupiter (Kochab Baal); Venus (Astoret Naamah = lovely Astarte), with her voluptuous cultus; and Saturnus (Moloch, Kronos), the evil principle. The elements were revered either in conjunction with certain deities or on their own account. The water, to which sacrifices were offered, both in the shape of human beings and animals or fruits, was haliowed in all its shapes—as the sea, as rivers, fountains, lakes—by which people took their most solemn oaths; the fire, in connection with the oldest deity of Phenicia; the light (Moloch); the air and the winds; the earth and all its plants, its forests, and glens, and trees, and more especially its mountains, as the "symbols of the high ones," or as "faces of God," such as mount Carmel, Lebanon, Antilibanus, and others. Of animal-worship we have only small traces.

Abstract notions and ideas were not forgotten. The year and the months, day and night, Aurora (Lilith), age and youth, art and love, had their altars. Nor were certain professions and trades without their visible patrons. Thus, there are gods of agriculture and horticulture, like Dagon, the god of grain; a Dionysos, whose Phenician name is lost, as the god of wine-growers; a god who is the numen of fruit-growing, of pisciculture, of mines, etc. Chthonian gods are not wanting. The god of death—the king of the lower regions—is Muth = Death (Pluto), who is represented as a small child. His name was shared by a goddess whose name is vaguely known as Eloti (my goddess), and who is occasionally identified with Astarte, Dido, Anna, Persephone, Europa, and a great many other deities.

We have already touched upon the mode of worship of the Phenicians, and the places chiefly selected for their rites. Mountains, heights, rivers, lakes, fountains, meadows, glens, were, as we said, the favorite habitations of the gods. But the Phenicians were also amongst the first who erected temples. These were generally divided in two parts, containing the sacred arks (the mystic cists of the Greeks); and the chariots upon which the sacred objects were at times carried about. Not being intended to be prayer-houses, but as dwelling-places for special gods, they were rather small, and did

not even contain the altar upon which the sacrifices were offered. This generally stood at the entrance of the temple, and around it the priests and hierodouloi danced in their service. Pure wells and an everlasting fire were the indispensable conditions of a sanctuary. The sacrifices themselves, as far as they consisted of animals, offer great analogies to those of the Jews; but the Phenicians also offered up human sacrifices—chiefly first-born male children, as that which the suppliant held dearest—chiefly to Baalsamin, Baal Hamon, and Astarte. Such human sacrifices, or burnt-offerings took place annually at the great festivals of expiation, and further on extraordinary occasions, at the beginning of important enterprises, such as a campaign and in great casualties: in order to expiate by one sacrifice the sin of all. The same fanaticism which fancied the gods best pleased by the offering up of what was most precious, led the Phenician women, like the Babylonian, to sacrifice their honor in honor of Astarte, on certain occasions, so that certain sanctuaries became hot-beds of prostitution. Circumcision—another kind of sacrifice—was not common among all the Phenician tribes, it being a rite principally sacred to El, the god of Berytus and Byblus.

Of festivals and pilgrimages in general, we have spoken under FESTIVALS, GREEK RELIGION, etc.; and what has been observed there respecting their character in Polytheism (their being to a great extent connected with the births, deaths, resurrections, and other personal phases of special deities), holds good here. No doubt, these festivals, like those of the Hebrews, and all other ancient nations, had, beside their religious, also their political and commercial significance; and Phenicia was more particularly, by the eminent position she held in the world's trade, a place towards which flocked, on solemn occasions, pilgrims from all parts of Asia and Africa. "Festival embassies," as they were called, were dispatched thither from Syria, Arabia, Babylonia, Cappadocia, Cilicia, Egypt, Armenia; nay, from India, Ethiopia, Persia, and Scythia; and not until the 5th c. A.D. did these pilgrimages to Phenicia cease entirely. One festival is entirely peculiar to Tyre, and strangely enough it is still celebrated by the present inhabitants of Sur—viz., the "wedding of the land-water with the sea-water." On these occasions, the people walk in procession to the well near the town-gate, and pour some pails of sea-water into it, in order to render it clear and sweet again for a long time.

It would be vain to try, with our scanty and adulterated sources, to gain a deeper insight into the ideas attached to the names, attributes, and modes of worship of the deities mentioned, or to speculate upon their moral influence upon the people of Phenicia. That these were pre-eminently practical; that arts and manufactures flourished among them, more than among any other ancient nation; that they knew how to turn science into money; that they were, in fact, shrewd men of business—all this we know, but little more. Atheists or pantheists, whichever they must be called in the modern sense of these words, it is extremely doubtful whether they, any more than the bulk of the Hebrews before the exile, believed, as a body, in immortality. What was their influence upon Greece, Rome, the whole ancient and modern world, in the province of religious thought, we shall never have any means fully to ascertain. Comparative mythology has a vast field to explore in this direction.

Phenician Language and Literature.—With the exception of Greek and Latin, no language was so widely known and spoken throughout antiquity as the Phenician; and monuments of it have been found, and continue to be found, almost all over the ancient world. We can only vaguely speculate on its early history and its various phases, so long as our materials yield so little information on that point. Its decline seems to date from the 8th c. B.C., when Aramaisms crept in in overwhelming numbers. Finally, the close contact with, and the everywhere preponderating influence of the Greeks, superseded—chiefly after Alexander's time—the ancient language almost completely; and even coins with Phenician legends occur not later than the 2d c. B.C.—An important Phenician literature seems to have been extant as late as the 1st c. A.D., but it has disappeared from the face of the earth. After the second half of the 3d c., the language had vanished entirely in the country itself, and Jerome, who lived in Palestine, mentions the Punic, but never the Phenician. In the west, it survived to a much later period. In Mauritania and Numidia, it remained, in a corrupted form, the reigning tongue as late as the 4th c. A.D.; and Augustine draws his explanations of Scripture from the Punic current in the 5th century. There was a translation of the whole Bible into Punic made for the use of the Punic churches; and in and near Tripolis and Bizanium, it was the language of the common people up to a late period. From the 6th c., however, it rapidly died out, chiefly in consequence of the Vandals, Goths, Moors, and other foreign tribes overrunning the country, and ingrafting their own idioms upon it.

As a branch of the so-called Semitic family of the Hebrews, Syrians, Arabs, etc., the Phenicians naturally are closely related to these also with respect to language. The affinity of the "speech of Canaan," as the Hebrew is called sometimes, with the Phenician was indeed remarked at an early period. Augustine, Jerome, and Priscian pointed out already—and sometimes in order to back some very peculiar notions—how closely these two languages and their dialects were allied. Yet it must be obvious at first sight, that however near the two idioms may originally have stood to each other, the peculiar relations and fortunes of the two races who spoke them must have produced substantial changes in their structures in the course of time. While the ancient scriptural monuments of the Hebrews—outwardly and inwardly—exhibit a rare unity of idiom and form,

the ancient hallowed utterance becoming a type and model for the later generations: the Phenecians, on the other hand, not confined within the narrow limits of their home-country, but mixing freely with all the nations of the earth, spreading their own colonies far and near among them, opened a wide field for the "development" of their language, or rather for its corruption, by its entering into alliance with Libyan in Africa, Sardinia, and Spain, and with Aramaic in northern Phenicia, Cilicia, and perhaps even in Cyprus. Thus it came to pass that the two languages which originally may have been identical in old Canaan became more and more widely divergent. To enter into a more detailed disquisition on this or other cognate points, we deem more hazardous now than we should have thought it only a very few years ago; for the more ample our discoveries in Phenician literature have become of late, the more it becomes evident that we are only at the commencement, as it were, of Phenician philology.

What we said of the structure of the Hebrew language (see JEWS) holds good for Phenician to a certain extent; and we shall therefore simply point out the most palpable differences between them. In the first instance, we observe the very strange circumstance, that what is considered an archaism or an isolated dictum in Hebrew, appears as a common expression in Phenician. Certain grammatical terminations, obsolete in Hebrew, are in use in Phenician—so that it would appear as if the Phenician had retained more of the ancient Canaanite speech than the Hebrew, which gradually transformed and refined it by grammatical niceties. Another feature is the preponderance of the Chaldee, or rather Aramaic words and forms—although here again we are on very dubious ground. It might further be questioned whether our Phenician inscriptions—all belonging to a very late period—are not rather a faithful reflection of the Hebrew of their period, which, since the 8th c. B.C., had more and more changed into Aramaic. So much is certain, that the original language of Canaan was perfectly free from Chaldaisms, and that these are but a late corruption—such as we also find in the later books of the Old Testament. Yet there are other features quite peculiar to the Phenician, which—although not of sufficient importance to warrant our separating the dialect entirely from the Hebrews—are of a nature not to be explained by any Semitic analogy; such as certain differences in the pronunciation of vowels, in the treatment of consonants, the formation of pronouns, some verbal forms, and certain words entirely foreign to the Semitic. Again, a distinction is to be made between the Phenician of Phenicia and that corrupted form of it spoken in the western colonies, called Punic, and further, that idiom peculiar to the inhabitants of Leptis, called Libyo-Phenician—a mixture of Phenician and Libyan, with a vast preponderance, however, of the former element.

The difference in the pronunciation may be briefly characterized as a tendency towards an obscuring or lowering, as it were, of the vowels: thus, the Hebrew *a* is changed into *o*, the *e* into *i* or *y*, *i* into *y*, sometimes into *u*, and *o* into *u*. Peculiar is also the use of the Hebrew *Ayin* as a vowel (*mater lectionis*), with the pronunciation of *o* or *u*. On some occasions, however, it is entirely omitted. The gutturals are changed at times, as in the corrupted orthography of Samaritan and Sabian, so that *L* and *R* are sometimes assimilated with the next consonant in the middle of the word, or entirely omitted, etc. As to grammar, our knowledge is extremely limited. A few undoubted facts are the termination of the nominative form in *at* instead of the Hebrew *ah*, the greater variety of genitive forms in Phenician, the difference in the formation of the pronoun, and the identity of the article with that in Hebrew (*ha*). For the Phenician alphabet, the model of all European alphabets, see ALPHABET.

The literature of Phenicia, in its original form, has, as we said, perished entirely. What traces and fragments we have of it, have survived in Greek translations. But from even these small remnants, we can easily imagine the extreme antiquity, and the high importance and vast extent of these productions, which, at first, seem to have been chiefly of a theological or theogonical nature. Their authors are the gods themselves, and the writings are only accessible to the priests, and to those initiated in the mysteries. From the allegorical explanations of these exalted personages sprang a new branch of sacred literature, of which those fragments of cosmogony mentioned above are derived. To the literary age of Taaut, Kadmus, Ophion, Esmun, etc., succeeded Thabion, Isiris, Sanchuniatho, and Mochus, who founded the schools of priests and prophets. These cultivated the sciences, chiefly the occult ones, magic, and the like. Nearest to the sacred literature stands didactic poetry, somewhat related to the Orphic, whose chief representatives are Sido, Jopas, etc. The erotic poetry is characterized as of a very sensuous nature, both in Phenicia and the colonies. Of historians are mentioned Mochus, Hypsikrates (Sanchuniatho ?), Theodotus, Philostratus, Menander, and others; but these are mere Greek versions of their Phenician names, and absolutely nothing has been preserved of their writings. Punic literature is also frequently mentioned by Greek and Roman writers. Geography, history, agriculture, were the fields chiefly cultivated by the colonists of Carthage and the west generally.

The monuments that have come down to us, and which not only have enabled us to judge for ourselves of the religion, the language, and the manners of the Phenicians, are of twofold kind—they are either legends on coins and lapidary inscriptions, or Phenician proper nouns and texts imbedded in the works of ancient classical, or sacred writers. The principal and ever-growing source for our information, however, are the monumental inscriptions, of whose existence, till the middle of the 18th c., nothing was

known. The most numerous Phenician remnants have been discovered in the colonies. Richard Pococke first found, on the site of ancient Citium (Larnaka of to-day), 31 (not 33, as generally stated) Phenician inscriptions, which he deposited at Oxford (published by Swinton, 1750). Malta, Sardinia, Carthage, Algiers, Tripolis, Athens, Marseilles, have each yielded a considerable number, so that altogether we are now in the possession of about 120 monuments, either votive tablets or tomb inscriptions. The latest and most remarkable are those now in the British museum, discovered at Carthage a few years ago by N. Davis, consisting of votive tablets, a (doubtful) tombstone, and a sacrificial tariff, which completes another stone found some years ago at Marseilles of the same nature; both setting forth the amount of taxes, or rather the proportionate share the priest was entitled to receive for each sacrifice. Another exceedingly valuable (trilingual) inscription, referring to the gift of an altar vowed to Eshmun-Asklepios, has been discovered quite recently in Sardinia. See below. One of the most important historical monuments is the sarcophagus of Ashmanasar II., king of Sidon (son of Tennes?), found at Tyre in 1855, the age of which has variously been conjectured between the 11th c. B.C. (Ewald)—a most incongruous guess indeed—the 7th (Hitzig), the 6th (Duc de Luynes), and the 4th (Levy), of which we shall add the commencement, literally translated: "In the month of Bul, in the 14th year that I reigned, king Ashmanasar, king of the Sidonians, son of king Tebnith, king of the Sidonians—spake king Ashmanasar, king of the Sidonians, saying: Carried away before my time, in the flood of days—in dumbness ceases the son of gods. Dead do I lie in this tomb, in the grave, on the place which I have built. I myself ordain that all the nobles and all the people shall not open this place of rest; they shall not seek for treasures and not carry away the sarcophagus of my resting-place, and not disturb me by mounting the couch of my slumbers. If people should speak to thee [and persuade thee to the contrary], do not listen to them. For all the nobles and all the people who shall open this sarcophagus of the place of rest, or carry away the sarcophagus of my couch, or disturb me upon this resting-place, may they find no rest with the departed; may they not be buried in a tomb, and may no son and successor live after them in their place;" etc.

i.e., Lerabbath Letanith Pen-Baal Uleaddan Lebaâl Ch[ammon A]
[Sh] Nadar Chanbaâl [Ben Abd] Ashmun . . . . [Shema] [Ko]l[a Barcha . . . . . "To the Lady Tanith, the Face of Baal, and to the Lord Baal Chammon [is dedicated this *scil*] which has vowed Hanbaâl [the son of Abd] Ashmun . . . . [When he (or she) hears his voice, may he (or she) bless."]

The votive tablets bear the same character throughout, differing only with respect to the name of the man or woman who placed it in a certain sanctuary in accordance with his or her vow. Their material is mostly limestone or fine sandstone, rarely marble, and they vary from 5 to 15 in. in height, from 4 to 7 in width, and from 1½ to 4 in thickness. Beginning in most cases with the dedication to the god or goddess, or both, thus: "[Sacred] To the god . . . . [this tablet] which vowed N. son (daughter) of N. When he (she) heard my voice and blessed," or "hear my voice and bless;" etc. The sepulchral tablets generally run somewhat in this manner: "Stone erected to . . . . , who lived . . . . years."—Much yet remains to be done. Even the paleographical side has, notwithstanding all the ready material, not been settled satisfactorily yet. One point, however, is indisputable even now. There are at least two kinds of Phenician writing to be distinguished most clearly. The older, purer, more orthographical, and more neatly executed is found in the inscriptions of Phenicia herself, of Malta, Athens, Citium, and Carthage; the younger, corrupted not only with respect to the grammar and language, but also with respect to the form of the letters, which are less carefully executed, and even exhibit some strange, probably degenerate, characters, is found chiefly on the monuments of Cyprus, Cilicia, Sardinia, Africa, Spain, Numidia, and the adjacent parts. See MOABITE STONE.

Besides these monumental sources for the language, there are a few remnants of it imbedded, as we said, in ancient non-Phenician writings. The Old Testament alone, however, has preserved its words—proper nouns chiefly—unmutilated. Later eastern writers even, not to mention the Greeks and Romans, have corrupted the spelling to such a degree that it is often most puzzling to trace the original Semitic words. Phenician names occur in Suidas, Dioscorides, Apuleius, in martyrologies, calendariums, acts of councils, in church fathers (Augustine, Priscianus, Servus), etc. The only really important remnant, however, is found preserved—albeit fearfully mutilated and Latinized—in Plautus's *Pœnulus*, act v. s. 1 of which contains, in 16 lines, the Phenician translation of the Latin text, with more than 100 Phenician words. Several other phrases and

words are embodied in act v. ss. 2 and 3 of the same play. Yet, although there is very little doubt among scholars about the greater portion of these texts, the corruption and mutilation which they had to undergo, first at the hands of Plautus, who probably only wrote them by the ear, then at the hands of generations of ignorant scribes, have made more than one word or passage an insoluble puzzle.

The specimen of Phenician [Punic] writing subjoined is taken from one of those Carthaginian votive tablets with which the British museum (now the wealthiest in Phenician monuments) has lately been enriched, as mentioned before.

The emblems on it are symbolical, and refer to the deities invoked. The lower part is mutilated, but easily supplied. The date is uncertain, perhaps the 2d or 3d c. B.C.

A trilingual inscription from a base of an altar, found at Pauli Gerrei, in Sardinia, was first fully explained by Deutsch. (See *Transactions* of the royal society of literature, 1864.)

Its contents are briefly this: A certain Cleon, Phenician by religion, Greek by name, Roman by nationality, a salt-farmer, vows an altar—material and weight of which are only given in Phenician; viz., copper, 100 lbs.—to Eshmun-Æsculapius "the healer" (the Phenician *mearrach*, clumsily transcribed *merre* in Latin, and *mirre* in Greek), in consideration for a cure to be performed. The date, given in Phenician, viz., the year of two, apparently annual, entirely unknown judges, gives no clue to the time. Paleographical reasons, however, would place it in about the 1st c. B.C.

Among those who have more or less successfully occupied themselves with Phenician antiquities, language, and literature, and who have also, in some instances, deciphered inscriptions, we mention Scaliger, Bochart, Pococke, Barthelemy, Swinton, Bayer, Dutens, Hamaker, Gesenius, Movers, Munck, Judas, Bargès, De Saulcy, Ewald, Levy, Vaux, Renan, De Luynes, De Vogué, Deutsch, and others; to whose writings, contained either in special works or scattered in transactions of learned societies, we refer for further information on the subject of our article. The principal work in German is Movers's *Phenizier*, unfortunately left unfinished at the author's death. A useful English compilation is Kenrick's *Phenicia* (Lond. 1855).

PHENICINE, or PHENYL BROWN, a rich dye, first prepared by Roth in 1865 by the action of nitro-sulphuric acid on carbolic acid or phenol. It is a brown, amorphous powder, very soluble in alcohol, ether, and acetic acid, slightly soluble in water. It consists of two coloring matters, one yellow, the other a black, humus-like body. It dyes silks and woolens without the aid of mordants. Silk which has been dyed with it, if treated with chromate of copper to which a small amount of sulphuric acid has been added, turns to a garnet red, and nitrate of copper produces a similar though not so intense an effect. Cotton may be dyed a deep purple by first immersing it in a solution of tannin, or of stannate of soda, as a mordant, and then in a solution of phenicine, and subsequently in a hot solution of chromate of potash. The color, however, is unstable.

PHE'NIX, the name of a mythical Egyptian bird, supposed by some to be a kind of plover, like the *kibitz*, often depicted with human arms, and called in hieroglyphs *rekh*. Others consider to be the *bennu*, or nycticorax, a bird sacred to Osiris, and represented watching the tamarisks over his coffin. The first of these representations has sometimes a star upon the head, supposed to indicate the astronomical period of its appearance. It visited Egypt after the death of its father, and entered the shrine particularly dedicated to it at Heliopolis, and there buried its parent, putting the body into an egg or case made of myrrh, and then closing up the egg. Another account is, that the phenix when about to die, made a nest for itself in Arabia, from which a new phenix sprung of itself. This bird proceeded to Heliopolis, and there burned and buried its father. But the more popularly known version is, that the phenix burned itself, and a new and young phenix sprung from the ashes. A less received version is, that a worm crawled out of the body of the dead phenix, and became the future one. The phenix was, according to the most authenic accounts, supposed to visit Egypt every 500 years; the precise period, however, was not known at Heliopolis, and was a subject of contention till its appearance. The connection of the phenix period with that of the Sothiac cycle, appears to be generally received by chronologists, as well as the statement of Herrepollo, that it designated the soul and the inundation of the Nile. A great difference of opinion has prevailed about the Phenix period: according to Ælian, it was a cycle of 500 years; Tactitus seems to make it one of 250 years; Lepsius a cycle of 1,500 years. The phenix was fabled to have four times appeared in Egypt: 1, under Sesostris; 2, under Amasis, 569–525 B.C.; 3, under Ptolemy Philadelphus, 284–246 B.C.; and lastly, 34 or 36 A.D., just prior to the death of Tiberius. The phenix also appears upon the coins of Constantine, 334 A.D. viz., 300 years after the death of Christ, who was considered the phenix by the monastic writers. It is supposed by the rabbins to be mentioned in Job and the Psalms.—Job. xxxix. 18; Psalms ciii. 5; Herodotus, ii. 73; Achilles Tatius, iii. 25; Tacitus. *An.* vi. 28; Tselzes, *Chil.* v, 397; Lepsius, *Einleit*, p. 183; *Archæologia*, vol xxx. p. 256.

PHENOL, PHENIC ACID. See CARBOLIC ACID.

PHENOM'ENON (Gr. appearance), the name given in philosophy to an object or fact as it is perceived by us, as distinguished from what it is in itself. In the philosophy of

Kant, that, whatever it may be, which is behind the phenomenon, and causes it, is called the *noumenon*, as being merely assumed or thought of in the mind. See METAPHYSICS, PERCEPTION.

PHE'NYL, AND THE PHENYL'IC GROUP. Phenyl, C_6H_5, is an organic radical, which has not yet been isolated. Its most important compounds are: (1.) carbolic or phenic acid, $C_6H_5 \cdot OH$, known also as phenol, phenyl hydrate, and phenyl-alcohol. See CARBOLIC ACID. (2.) Phenyl hydride, C_6H_6, known also as benzole, benzene, and phene. See BENZOLE. (3.) Phenylamine or phenylia, $C_6H_5 \cdot NH_2$, or C_6H_7N, better known under the name of aniline, one of the most important of the artificially formed bases.

Aniline derives its name from *anil*, an obsolete name for indigo, which is one of the sources from which it was originally procured. It exists amongst the products of the distillation of coal, and probably other organic compounds, but is always obtained by the manufacturing chemist either from indigo or from nitro-benzole. Dr. Hofmann, to whom we are mainly indebted for our knowledge of the chemistry of this substance, gives the following directions for obtaining it from indigo: "Powdered indigo boiled with a highly concentrated solution of hydrate of potassa, dissolves with evolution of hydrogen gas to a brownish-red liquid, containing a peculiar acid, called the *anthranilic* acid. If this matter be transferred to a retort, and still further heated, it swells up, and disengages aniline, which condenses in the form of oily drops in the neck of the retort and in the receiver. Separated from the ammoniacal water by which it is accompanied and re-distilled, it is obtained nearly colorless. The formation of aniline from indigo is represented by the following equation:

Indigo. Hydrated Potassa. Aniline. Carbonate of Potassa.

$$\overbrace{C_{16}H_{10}N_2O_2} + \overbrace{8KOH} + 2H_2O = \overbrace{2C_6H_7N} + \overbrace{4K_2CO_3} + 4H_2."$$

By this process, the indigo is made to yield about one-fifth of its weight of pure aniline. Nitro-benzole is converted into aniline by the action of various reducing agents, such as hydrosulphate of ammonia, or acetate of protoxide of iron; and the distillation of one part of nitro-benzole, one part of acetic acid, and one and a half parts of iron filings, is regarded by Hofmann as the best means of preparing aniline, which is now required in large quantities for the manufacture of artificial dyestuffs.

"When pure," says Dr. Hofmann, "aniline forms a thin, oily, colorless liquid, of faint vinous odor, and aromatic burning taste. It is very volatile, but has nevertheless a high boiling-point, 364° F. (184.5° C.). In the air it gradually becomes yellow or brown, and acquires a resinous consistency. Its density is 1.028. It is destitute of alkaline reaction to test-paper, but is remarkable for the number and beauty of the crystallizable compounds it forms with acids. Two extraordinary reactions characterize this body, and distinguish it from all others—viz., that with chromic acid, and that with solution of hypochlorite of calcium. The former gives with aniline a deep greenish or bluish black precipitate; and the latter, an extremely beautiful violet-colored compound, the fine tint of which is, however, very soon destroyed." In the manufacture of aniline on a large scale several bases having higher boiling points than aniline are formed. To one of these—a beautiful crystalline compound, represented by the formula $C_{12}H_{14}N_2$—the name of *paraniline* has been given, from its being polymeric with aniline. Aniline is a substance of the greatest importance in theoretical organic chemistry, from the large number of derivatives and substitution products which it yields, and for the knowledge of which we are almost entirely indebted to Hofmann, whose investigations originally appeared in a series of papers in the *Transactions of the Philosophical Society*. These compounds are, however, for the most part of too complicated a nature to be noticed in these pages. But, independently of its theoretical importance, this substance has recently been extensively employed in the arts, a series of coloring matters of unequaled beauty having been obtained from it by the action of various reagents. It is to Mr. W. H. Perkin that we are indebted for the idea of applying practically the property possessed by aniline of forming violet and blue solutions with chromic acid and with hypochlorite of calcium, to which we have already referred; and he succeeded in fixing these colors, and adapting them to the use of the dyer. The most important of these coloring matters are described in the article DYE-STUFFS (q.v.).

(4.) Trinitrophenol, $C_6H_2(NO_2)_3(OH)$, in which three of the atoms of hydrogen of phenol are replaced by three molecules of the group, NO_2; known as carbazotic acid (q.v.), and picric acid. In addition to the remarks contained in the article on CARBAZOTIC ACID, it may be noticed that while a solution of this acid communicates a bright yellow tint to animal textures, as the skin, wool, and silk, it has no such effect on tissues composed of vegetable fibers, such as cotton and linen, and hence it may be employed to ascertain whether the materials of any tissue belong to the animal or to the vegetable kingdom. A solution of a salt of this acid, when treated with indigo, yields a beautiful green color, which is employed in the manufacture of artificial flowers, and for various other purposes. In doses of 1 to 10 grains, it acts on rabbits as a strong poison, occasioning convulsions and speedy death. It has been prescribed in small doses, with moderate success, in cases of intermittent fever; but patients to whom

it is given should be previously informed that it possesses the property of giving to the eye a yellow, and, as it were, a jaundiced appearance. All the salts of this acid are of a beautiful red or yellow tint, and most of them form brilliant crystals. When heated, or in some cases when only struck, they explode with considerable violence.

PHE'ON, in heraldry, the barbed head of a dart. It is represented as engrailed on the inner side, and its position is with the point downward, unless otherwise blazoned.

PHE'RÆ, a powerful city of Thessaly, near mount Pelion; according to legend, the ancient royal seat of Admetus and Alcestis; and afterward of political consequence under "tyrants" of its own, who long made their influence felt in the affairs of Greece, and repeatedly attempted to make themselves masters of Thessaly. One of these tyrants named Alexander, is particularly celebrated for his cruelties. It was one of his practices to bury innocent persons alive, and another to sew them up in the skins of wild beasts and set his hounds upon them. After a bloody reign of thirteen years he was slain by his wife and her brother, 357 B.C. Five years later, Pheræ, with the rest of Thessaly, became subject to Philip of Macedon.—At Pheræ there was a mineral spring, named Hyperia, famous for its healing virtues. A few ruins at Velestinos still mark the site of the city.

PHERECY'DES, an ancient Greek writer, b. in the island of Syros, one of the Cyclades in the 6th c. B.C. He is said by Diogenes Laertius to have been a rival of Thales, and to have learned his wisdom from the Egyptians and Chaldeans. He wrote a cosmogony in a kind of prose much resembling poetry, under the title *Heptamychos,* the meaning of which is doubtful. In a manner rather poetic than philosophic, he endeavored in this work to show the origin of all things from three eternal principles, *Time* or *Kronos; Earth,* as the formless and passive mass; and *Æther* or *Zeus,* as the formative principle. He taught the doctrine of the existence of the human soul after death; but it is uncertain if he held the doctrine of the transmigration of souls, afterward promulgated by his disciple, Pythagoras. Of his work, only fragments are extant, which have been collected and elucidated by Sturtz (Gera, 1798; 2d ed., Leip. 1824).—Another Pherecydes who lived in the 5th c. B.C., compiled the mythical histories of Athens and other states, but, except a few fragments, the work is lost. See Sturtz, *Pherecydis Fragmenta* (Leip. 1824).

PHID'IAS, or **PHEI'DIAS** (Lat. *Phidias*), son of Charmides, the greatest sculptor of ancient Greece, b. at Athens probably between 500–490 B.C. His first instructor in art was Hegias of Athens; he afterward studied under a more famous master, Ageladas of Argos. He appears to have first acquired distinction in his profession soon after the battle of Salamis, and indeed his great works were all executed during a period most favorable for the development and encouragement of genius, when Greece was triumphant over external enemies, and her people enjoyed a more perfect liberty than almost at any other period of their history. With the character of the age correspond the works of its poets, particularly of the tragedians Æschylus, Sophocles, and Euripides, and of its sculptors, particularly of Phidias. Under Cimon's administration the Athenians began the work of restoring their city, which the Persians had destroyed, in more than its former magnificence, and to fill it with noble works of art. Phidias was accordingly employed in making the colossal brazen statue of Minerva, *Athena Promachos,* which was placed upon the citadel, and was executed probably about 460 B.C. To the government of Cimon succeeded that of Pericles, still more brilliant, and signalized by an extraordinary development of art. Pericles not only gave to Phidias a commission to execute all the more splendid statues that were to be erected, but made him general superintendent of all works of art going on in the city. Plutarch tells us that Phidias had under him architects, statuaries, workers in copper and bronze, stone-cutters, gold and ivory beaters, etc. To Phidias, as director-general of all the skilled artists and artificers of Athens, we owe, among other glorious edifices, the Propylæa and the Parthenon, the sculptured ornaments of which were executed under his direct superintendence, while the statue of the goddess Athene, the materials for which were ivory and gold, was the work of Phidias himself (*circa* 438 B.C.). This statue was clothed with a golden robe, which alone was worth 44 talents of gold. The statue is gone for ever, and the Parthenon is now only a magnificent wreck, but we still possess some splendid evidence of the genius of Phidias, in the sculptures of the metopes, and friezes of the temple of Athene. See ELGIN MARBLES. Next year Phidias went to Elis, where he executed a colossal statue of Zeus for the Olympeium at Olympia (q.v.), also of ivory and gold (about 433 B.C.). This was reckoned his masterpiece. On his return to Athens, political passions were running high. There was a strong—at least a violent—party inimical to Pericles, but as they did not dare to attack the great statesman, they assailed him through his friends Phidias, Anaxagoras, Aspasia, etc. Phidias was accused of having appropriated to himself some portion of the gold destined for the robe of Athene. This accusation he repelled by taking off the robe and weighing it. He was then accused of impiety, for having introduced his own likeness and that of Pericles on the shield of the goddess. On this most frivolous and contemptible pretext he was thrown into prison, and died there, but whether of sickness or poison is uncertain. His death took place about 432 B.C. The works executed by or ascribed to Phidias were numerous, but we have mentioned the most celebrated. Their prevailing characteristic appears to have been an

ideal sublimity, and even the imperfect relics that we possess are the most noble specimens of sculpture in the world. See illus., GRECIAN SCULPTURE, vol. VII.; SCULPTURE, vol. XIII.

PHIGALIAN MARBLES, the name now given to the sculptured frieze taken from the cella or the temple of Apollo at Phigalia in Arcadia in 1814, and transferred to the British Museum. It represents the contests between the Centaurs and Lapithæ. The Phigalian temple of Apollo is, next to the Theseium at Athens, the most perfect architectural ruin in all Greece; but owing to its sequestered position at the head of a lonely and rocky glen among the Arcadian hills, it long remained unknown in modern times, except to the shepherds of the district; and to the same circumstance it probably owes, in part, its preservation. Chandler first visited and described it in 1765; he was followed by Gell, Dodwell, and others; and in 1812 it was very carefully examined by a body of artists and scholars, the results of whose investigations are given in Stackelberg's *Der Apollo-tempel zu Bassä in Arkadien* (Rome, 1826). The temple is built of a hard yellowish-brown limestone, stands n. and s., was originally about 125 ft. long and 48 broad, and had 15 columns on either side, and 6 on either front, of which 36 still remain.

PHILADELPHIA, in Lydia. See ALA-SHEHR.

PHILADELPHIA, the principal city of Pennsylvania, and the third city in population in the United States, is situated on two large rivers: the Delaware, which separates it from New Jersey, and the Schuylkill, which flows through it, joining the Delaware at League Island; lat. 39° 57′ north; long. 75° 9′ west; 96 miles from the Atlantic ocean, 85 miles southwest of New York, and 125 miles in a direct line from Washington.

HISTORY.—Philadelphia, meaning "the city of brotherly love," was founded and named by William Penn. A small party of colonists sent out by him arrived in September, 1681. Penn himself came in October, 1682, but the settlement was laid out by his commissioners several months earlier. A few weeks after Penn's arrival the first treaty with the Indians was made at Shackamaxon. A few Swedes occupied part of the present city, but they received the new settlers with friendliness, as did the Indians. The limits of the town were Vine and Cedar Streets and the two rivers; and by 1684 it contained over 300 houses and 2500 people. The immigration from England, Wales, Germany and Holland in 1683–84, and for some years later, was large; the majority of the settlers being Quakers, whose influence predominated for many years. The first colonial assembly was held at Chester in 1682, the second was held in Philadelphia, January, 1683. Penn returned to England in 1684, and did not revisit the city till 1699, when he found a population of 4500 and 700 houses. Penn presented the city charter in 1701, though its incorporation dates from 1691. The first English school was opened in 1683; the *American Weekly Mercury* was started in 1719; Franklin's *Pennsylvania Gazette* in 1729, merged in the *North American* in 1840; and the *Pennsylvania Journal* and *Weekly Advertiser* was started in 1742. In 1741 the city was divided into 10 wards, and there were then 1621 taxable citizens; and from the early part of the century rivalled Boston as the leading city of the colonies. In 1742 the exports to Great Britain amounted to £8527 12s. 8d., the imports, to £75,295 3s. 4d. In 1723 Benjamin Franklin, the man who, next to Penn, exerted the greatest influence on affairs, came to the city. In 1747, by the publication of his *Plain Truth*, Franklin roused a spirit of military enthusiasm, a force of 10,000 was raised, and a battery was erected below the city, on the site of the present United States Navy Yard. In 1751 the first line of packet boats to New York was established, followed, in 1756, by a stage line. Under Franklin's influence, in 1747 the merchants of Philadelphia sent a ship to discover the northwest passage. The first theatre was opened in 1754 by a company of comedians from London. In 1755 a militia bill was passed, and Franklin became colonel of the city regiment. From 1763–64 Philadelphia was prominent in resisting British aggression, though the loyalist party was strong, and most of the Friends opposed warfare; and in it most of the important official events of the Revolution took place. The first Continental Congress met in Carpenter's Hall, September 5th, 1774; the second met May 10th, 1775, in the State House; and there, on June 15th, Colonel George Washington was appointed general and commander-in-chief of the Continental army. In 1776 Congress met for the third time in the State House, where the Declaration of Independence was adopted, July 4th, and proclaimed July 8th. Philadelphia was held by the British from September, 1777 to June 18th, 1778. The battle of Germantown was fought October 4th, 1777. Delegates from the different states met at the State House in May, 1787, to draw a new constitution, the session lasting till September 17th. A new city charter was granted by the legislature March 11th, 1789. Two visitations of yellow fever, in 1793 and 1798, caused great loss of life; in the first 4000 deaths resulted. The city was the capital of Pennsylvania until 1799; the seat of the Federal Government from 1790 to 1800, and the monetary centre till 1836. In 1812 the steam water-works at Fairmount were begun and started in 1815. The Philadelphia, Germantown and Morristown Railroad was completed in 1832; and the same year nearly 1000 deaths resulted from Asiatic cholera. Anti-slavery and religious riots disturbed the city from 1834 to 1844; and the suppression of the Bank of the United States in 1836 for a time prostrated commerce. Gas was introduced in 1836, and the first telegraph line was established in April, 1846. February 2d, 1854,

a consolidation act was passed by the legislature, extending the city limits to the county boundaries, and uniting under one municipal government all the outlying districts, known as Southwark, Northern Liberties, Kensington, Spring Garden, Moyamensing, Penn, Richmond, West Philadelphia and Belmont; also the boroughs of Germantown, Manayunk, and other townships. Philadelphia took an active part in the Civil War, and raised more than $1,000,000 by a sanitary fair in 1864. The centenary of American Independence was celebrated in 1876 (see CENTENNIAL); the bi-centennial of the landing of William Penn in 1882; and the centennial of the signing of the Constitution in 1887.

TOPOGRAPHY.—The city lies principally on a low peninsula between the two rivers. In the closely built portion the greatest elevation is only forty-six feet, while in the suburbs the ground rises to a height of 440 feet. The length from north to south is 22 miles, and the width is from five to ten miles, covering an area of about 129 square miles, or 82,603 acres, making Philadelphia the second city in extent in the United States. It is bounded on the northeast by Poquessink creek, and on the southwest by Cobb's and Darby creeks. On the Delaware river the city has a water front of more than twenty miles, over five miles being occupied by wharves. The river is navigable for large vessels, having at the wharves an average depth of 50 feet; and the harbor has been improved by the removal of the islands in the center of the river. The Schuylkill is navigable for small vessels only, and is crossed by numerous bridges within the city limits, the finest of which are the Girard avenue and the Spring Garden street bridges. That part of the city lying west of the Schuylkill, and known as West Philadelphia, includes several former townships and villages, some of which retain their old names. The largest of these old towns is Germantown, which was settled in 1683, was the scene of the battle of October 4th, 1777 (see GERMANTOWN), and contains several old houses, the Chew house, with marks of cannon-balls, the Johnson house, the Mermaid inn, and the Wakefield mills. It is one of the finest suburbs, and has many beautiful residences. Chestnut Hill, another beautiful suburb, lies on the highest ground in the city. On the southern side of the mouth of the Schuylkill is Fort Mifflin and the site of Mud Fort, built in 1777; new fortifications are to be constructed opposite on the site of the Revolutionary Fort Mercer. Just above the mouth of the Schuylkill is the League Island navy yard, one of the largest in the United States, with an area of 923 acres.

The city is laid out with extreme regularity, and contains over 1,300 miles of streets, a large part of which is improved. In the original plan Penn laid out two wide streets, Market and Broad, crossing at right angles, with an open space at their intersection, and four other squares in the sections thus formed. Nearly all the other streets are parallel to these two. Those running north and south are numbered from the Delaware to the Schuylkill, while those running east and west are named. The numbering of houses is very exact; with the streets running east and west, beginning at the Delaware; and with those running north and south beginning at Market street; and with each block a new hundred of numbers commences. Philadelphia contains more small houses than any other large city in the world; tenement-houses are almost unknown, and the average number of inhabitants to a dwelling is 5.6 persons, while that of New York is 16.37. Many houses in the older portions are of the characteristic red brick, with white marble trimmings; but in the newer sections the architecture is as varied as that of any modern city.

BUILDINGS.—In the center of the city, at the intersection of Broad and Market streets, is the City hall, generally known as the Public buildings, on a plot of ground once known as Penn square. This enormous structure, probably the largest building in the United States, is 486 feet long from north to south, and 470 feet wide, and covers an area of four and a half acres. The building, in modified French Renaissance architecture, is of granite and white marble, with a central tower 547 feet high, surmounted by a statue of William Penn, 37 feet in height. It contains 520 rooms, and is adorned with statuary in the interior and with huge statues on the numerous pediments. On the west side of the square, opposite the City Hall, is the Broad street station of the Pennsylvania railroad, ten stories in height, with a frontage of 307 feet. Above the main entrance rises a fine tower, 240 feet in height. The train-shed is 700 feet long by 307 feet wide, and contains sixteen tracks. An elevated road-bed leads to the Schuylkill river. On the north side of the square is the stately Masonic temple, built of granite in Norman style at a cost of $1,500,000. Two of its greatest beauties are the tower, 230 feet high, and the carved Norman porch. The lodge rooms are elaborately decorated in Egyptian, Norman, Ionic, Corinthian, Renaissance, Gothic and Oriental styles. On the east side of the square is John Wanamaker's retail store, occupying an entire block. East of Broad street, on Chestnut, is the United States mint, a white marble building with an Ionic portico. The original building, erected in 1792, was the first structure in the United States built under the Federal Government. The present building dates from 1829–33. For many years all coinage was carried on here, and now all the smaller coins and all devices and dies are made here. The value of the coinage since the establishment of the mint to 1891 was $1,056,337,771. A larger building has become necessary, and a new one is under construction at Sixteenth and Spring Garden streets. West of the old mint, on Broad street, is the Romanesque building of the Girard life insurance company. Adjoining it is the handsome Betz building, thirteen stories high, and containing

over 300 offices. On Chestnut street, the chief street of Philadelphia, are many of the finest buildings. On 12th street is the William Penn charter school, founded in 1689, and the handsome house of the New Century club. On 10th street is the Mercantile library, founded in 1821, containing 177,000 volumes. At the corner of 9th street is the post-office, a large Renaissance granite building, costing nearly $8,000,000, and containing the United States court rooms and offices of the Federal officials. Next it, on Chestnut street is the fine granite office of the *Record*, and adjoining that is the attractive Saracenic building of the Penn Mutual Life, and next stands the Singerly building, also with an elaborate façade. In this district are many of the leading stores, theaters, hotels, and newspaper offices. At the corner of 6th street is the Public Ledger building, at the angle of which is a statue of Benjamin Franklin. On 7th street is the Franklin institute, founded in 1824 for the promotion of mechanic arts, with a valuable scientific library, courses of lectures and drawing-schools; opposite, the Builders' Exchange, with a permanent exhibition and successful trades-schools. On Chestnut street, between 5th and 6th, stands Independence Hall, the State House of Colonial times, and the most famous historic building in Philadelphia. It is a plain brick building, erected in 1729–34; in the East Room the second continental congress met in 1776, and there, July 4th, 1776, congress in secret session adopted the Declaration of Independence, which was read publicly on the 8th in the square behind the State House. In 1787 the constitutional convention met in the hall and drew up and adopted the constitution of the United States. The hall is almost as when Congress met there, and contains the old furniture—the table on which the Declaration was signed, Hancock's chair, with the emblem which caused Franklin to wonder whether it meant the rising or the setting sun. On the walls are portraits of most of the signers, and the original "Rattlesnake" flags, with the motto, "Don't tread on me." In the museum, on the same floor, is West's painting of Penn's Treaty with the Indians, Ramsay's portrait of George III., the original charter of the city, the silver inkstand used in signing the Declaration of Independence, and the famous Liberty Bell, with its prophetic inscription. West of the State House is Congress Hall, occupied in early days by the Federal Government, and where Washington was inaugurated in 1793 and John Adams in 1797. Fronting Independence Hall is the Romanesque building of the Pennsylvania company for life insurance and annuities, organized in 1809. Near Chestnut, on 5th street, is the American philosophical society, an outgrowth of the "Junto" club, founded by Franklin in 1743, and the oldest institution of its kind in America. At the corner is the magnificent Drexel building, of white marble, ten stories high, and containing the rooms of the Stock Exchange and the Board of Trade. The new Bourse extends from 4th to 5th streets, with arcades leading to Chestnut and Market streets, and is 362 feet long and 130 feet wide, and ten stories in height. The building is of stone, light brick and terra-cotta, and cost with the land $2,000,000. On the first floor is the great hall, divided by rows of columns, and the tenth floor is devoted to a museum of trade. On the next block is the Custom-House, modeled after the Parthenon, and considered one of the best specimens of Doric architecture in the world. It was originally erected in 1819–24 for the Second United States Bank. From Chestnut street between 3d and 4th streets, a court leads to Carpenters' hall, a small, plain brick building, where the first continental congress met, September 5th, 1774. It was built in 1770 by the Society of Carpenters, and was used for public meetings, and finally became an auction-room, but was restored by the Company of Carpenters to its original appearance, and now contains many interesting relics of Revolutionary days. The Commercial Exchange, on 2d street, is on the site of the house of William Penn. On Walnut street, which runs parallel with Chestnut, is the Merchants' Exchange, at the intersection of 3d and Dock streets, a handsome building with a semi-circular Corinthian portico. Near it is the Gerard Bank, also a Greek structure, built for the first United States Bank, and afterwards owned by Stephen Girard. In this vicinity are the handsome buildings of numerous insurance companies, and at the corner of 4th street is the imposing Bullitt building. Between 6th and 7th streets Walnut passes Washington square, one of the five parks of the original plan, a prettily laid out square of six acres, containing a great variety of trees. On the east side is the Athenæum Library, organized in 1814; and at the southwest corner is the granite building of the Saving-Fund Society, founded in 1816. Two blocks south of Walnut street is the Pennsylvania Hospital, occupying an entire square, bounded by Spruce, Pine, 8th and 9th streets. It was chartered in 1751, and the corner-stone was laid in 1755. At the corner of Locust and 13th streets is the building of the Historical Society of Pennsylvania, which was founded in 1824. It contains the Tower collection of colonial laws, books printed in Philadelphia from 1685 to 1785, a collection of colonial newspapers, manuscripts relating to the Penn family, and the Maclure collection of books on the French Revolution. Among the many interesting relics are Penn's original Instructions, his Wampum Treaty Belt and Bible, the *Bradford Almanack* of 1686 (the first book printed in the United States), the first copy of *Poor Richard's Almanack*, the first Bible printed in America, one of the Stamp Act stamps, part of Franklin's printing-press, the old charter of Philadelphia, and portraits of Penn, Franklin, Washington, Morris and others. Diagonally opposite is the College of Physicians, incorporated in 1680, containing a valuable medical library, ranking next to that of the Royal College of

Physicians in London. In this neighborhood are many of the leading clubs; the finest building is that of the University club, in Spanish-Moorish style. On Locust street, corner of Juniper, is the main building of the Philadelphia Library, founded in 1731 by Benjamin Franklin and other members of the "Junto" club, and the first subscription library established in the United States. In addition to the library of 188,600 volumes, it contains a clock said to have belonged to Cromwell, part of Franklin's electrical machine and other relics. West of Broad street, Walnut street contains mostly private residences. Between 18th and 19th streets it passes Rittenhouse square, the "South-West square" of Penn's time, and now the most fashionable section of the city, with fine houses and many beautiful churches; prominent among the latter are the handsome Gothic Church of the Holy Trinity, the First Unitarian, and the beautiful Gothic New Jerusalem Church. On South Broad street, above Walnut, is the club-house of the Union League, the leading republican club, with 1400 members; below it is the beautiful Renaissance building of the Art club, containing two galleries, in which excellent exhibitions of pictures are given. A few doors below is the Academy of Music, a fine music-hall, capable of seating 2900 persons. Near it is Horticultural hall, founded in 1827; and at the corner of Pine street is the building formerly occupied by the Deaf and Dumb Asylum, removed in 1892 to Mount Airy. Between Christian and Carpenter streets is the handsome granite building of the Ridgway Branch of the Philadelphia Library, a bequest by Dr. James Rush, amounting to $1,500,000. It contains the most valuable books of the library and some interesting relics. A few blocks farther south is the massive Tudor building of Moyamensing prison. North Broad street contains some of the finest residences of Philadelphia in its upper part, and is one of the finest streets in the city. A short distance north of the City hall is the Academy of Fine Arts, a Venetian building with an elaborate façade, consisting of a central tower and slightly recessed wings. The principal features of the interior are the entrance hall and staircase, which are decorated with handsome marbles. The building and land cost nearly $500,000, and the collection is one of the most extensive in the country, and includes 300 paintings, bronzes, sculptures, several hundred casts, and 60,000 engravings. Some of the important paintings are West's "Rejection of Christ;" Bouguereau's "Orestes;" Vanderlyn's "Ariadne;" Wittkamp's "Deliverance of Leyden;" Carolus Duran's "Mme. Modjeska." Among the sculptures are Story's "Jerusalem;" Power's "Proserpine," Palmer's "Spring," and Lough's "Battle of the Centaurs and Lapithæ."

Opposite the Academy is the new Odd-Fellows' hall, a beautiful Italian Renaissance building of buff brick and terra-cotta; the Cyclorama; and further up is the armory of the State Fencibles. Race street leads to Logan square, facing which, on the east, is the Roman Catholic cathedral of SS. Peter and Paul, a fine stone edifice with a Corinthian portico and a dome 210 feet high. The interior is richly decorated with paintings, and over the high altar is a Crucifixion by Brumidi. On the south side of the square is the Academy of Natural Sciences, a large Gothic building of green serpentine, erected in 1875. The society, which is the oldest of the kind in the country, was founded in 1812. The museum contains many valuable collections: among them are an unrivaled collection of shells, the Morton collection of crania, and the collection of birds. On Broad street, at the corner of Spring Garden street, is the Spring Garden institute, giving instruction in drawing, painting, and mechanic arts to young men and boys. Opposite are the Baldwin locomotive works, one of the largest plants of its kind in the world, covering an area of fourteen acres. About one thousand locomotives are produced yearly. East of Broad, on Spring Garden street, is the Pennsylvania School of Industrial Art, incorporated in 1876, to develop the art industries of the state. Instruction is given in weaving and textile design, drawing, carving, modeling, and decorative painting. With it is connected the Museum at Memorial hall. A short distance above are the Boys' Central high school and Synagogue Rodef Shalom, a fine example of Saracenic architecture. On Fairmount avenue, some distance west, is the Eastern penitentiary, a celebrated prison, conducted on the individual system, At the corner of Broad and Oxford streets is the new Columbia club, one of the finest club-houses in the city. Near it is Grace Baptist temple, a handsome Romanesque building, with seats for more than 3000 persons. Opposite Grace church is the main entrance to Monument cemetery, containing a fine monument to the memory of Washington and Lafayette. At some distance is the baseball park, belonging to the Philadelphia club. On Montgomery avenue and 17th street is the Wagner Institute of Science, containing a valuable library, a museum, and laboratories. Half a mile west of Broad street, on Girard avenue, stands Girard college, one of the richest benevolent institutions in the United States, founded in 1831 by Stephen Girard for the education of poor white orphan boys. Two million dollars was given to build the college, and the greater part of Girard's estate to endow it, and the value of the bequest has increased to about $15,000,000. The main building, in Corinthian style, was designed by T. U. Walter, and is one of the finest examples of Greek architecture in the country. In the vestibule is a statue of Girard by Gevelot, and his sarcophagus. The other buildings number about twelve, the principal being of white marble, and accommodate about 1550 boys. The grounds cover forty-one acres, are lighted by seven electric masts, 125 feet high, and contain a monument to pupils who were killed in the civil war.

According to a provision of Mr. Girard's will, no clergyman is allowed to enter the enclosure. Opposite the college is the German hospital, and in the same enclosure stands the Mary J. Drexel home, founded in 1888 by Mr. Lankenan in memory of his wife. It is a beautiful Gothic building, containing a hospital and home for children and for the aged. Northeast of the college is the great Church of the Gesù, with a beautifully decorated interior, and several Roman Catholic schools and hospitals. To the north are the handsome buildings of the Woman's medical college and Women's hospital. The principal entrances to Fairmount park are at the end of Girard avenue and Green street. The park is the largest city park in the world, having an area of over 3000 acres, and extends along both banks of the Schuylkill for over 7 miles, and for over 6 miles along the picturesque valley of Wissahickon creek. Near the Green street entrance is the hill from which the park takes its name, and from which a fine view is obtained. Beyond an open space, with a fine bronze statue of Lincoln, is Lemon hill, on top of which is Robert Morris's mansion. Crossing the river by the handsome Girard Avenue bridge, 120 feet wide, the larger part of the park is reached. On the south is the Zoological garden, containing the finest collection in the country. It occupies the tract formerly the country-seat of John Penn, whose house, the "Solitude," is still standing. A short distance beyond is the Penn or Letitia house, built in 1682, the first brick house in the city, removed to this point from its old location. The park contains two of the Centennial exhibition buildings—Memorial hall, now containing a valuable art collection, and Horticultural hall, now used as a winter-garden.

West Philadelphia contains many beautiful residences and numerous public institutions. On Woodland avenue are the handsome Gothic buildings of the University of Pennsylvania, first chartered in 1753, Dr. Franklin being one of the originators. The principal buildings are College hall, built of serpentine, with gray stone trimmings: the beautiful library of redstone and brick, designed by Mr. Frank Furness, and one of the finest and most convenient library buildings in the world. It contains about 140,000 volumes and valuable collections. Near by, on Spruce street, is the University hospital, which is connected with the medical department of the university; and south lies the large Blockley almshouse, and near it the Philadelphia hospital, the oldest in the United States. At the corner of Chestnut and 32d streets is the Drexel institute, opened in December, 1891, founded by Mr. A. J. Drexel at a cost of $1,500,000. The building is large and very ornate, of brick and terra-cotta, and is a fine example of classic Renaissance architecture. The noble entrance leads to a large central court, 65 feet square, open to the roof. On the main floor are a museum, a lecture-hall, an auditorium seating 1500 persons, and a library with a collection of rare manuscripts and autographs, presented by Mr. G. W. Childs. There are departments of science, art, and general industrial training, and there is an attendance of 1500 students. North of Market street, between 42d and 50th streets, is the Pennsylvania hospital for the insane, usually known as Kirkbride's hospital, a branch of the Pennsylvania hospital, from which it was set off in 1841. The extensive and handsome buildings are situated in grounds covering one hundred and eleven acres, and contain West's painting of "Christ Healing the Sick."

In the old part of the city, the Penn national bank, at the corner of Market and 7th streets, is on the site of the house in which Jefferson wrote the Declaration of Independence, and on Arch street, near 2d, is the house in which the first American flag was made by Mrs. John Ross in 1777. On 2d street, below Arch, is Christ church, a colonial brick edifice built in 1727–37 on the site of a church erected in 1695. In the churchyard on 5th street are the graves of Benjamin Franklin and his wife, and of other prominent citizens. Near the Delaware, below Christian street, is the interesting old Swedes' church (Gloria Dei), built in 1700, on the site of an old wooden church of 1646. Near by is the enormous sugar refinery of Claus Spreckels. On Beach street, near the river, the Penn treaty monument marks the probable site of Penn's treaty with the Indians in 1682. Farther north is Cramp's shipyard, one of the most important in the country, employing about 4000 men. Many of the new vessels for the navy and large ocean steamers have been built here. On the Schuylkill river are the United States naval asylum and the arsenal.

Education. — In 1896 the city had public school property valued at over $11,000,000. The number of pupils was 163,000, and of teachers was 3100 with an expenditure of over $3,500,000. The nautical school-ship Saratoga is stationed here. The higher institutions are the University of Pennsylvania (q. v.), La Salle college (Roman Catholic), and Girard college. In addition to the University medical school there are the Jefferson, Hahnemann, Homeopathic, Woman's, and two eclectic medical colleges; a training-school for nurses, two schools of pharmacy, and two of dentistry. Industrial education is provided by the Franklin, Wagner, Spring Garden and Drexel institutes, and the Polytechnic college. The principal art schools are those of the Academy of Fine Arts, the Pennsylvania School of Industrial Art, the Normal Art School and the School of Design. There are Roman Catholic, Episcopal and Lutheran divinity schools, a school of oratory, and a conservatory and school of music. In the vicinity of Philadelphia are Haverford, Swarthmore, and Bryn Mawr colleges, and the Williamson School of Mechanical Trades, costing $2,125,000.

LIBRARIES.—The chief libraries are the Philadelphia, 188,600 volumes; the Mercantile, 177,000 volumes; the Historical Society, 40,000; the Athenæum, 30,000; Apprentices', 17,300; Public, 105,000; Franklin Institute, 42,000; American Philosophical Society, 50,000, and the Academy of Natural Science, 40,000 volumes. There are over 300 daily and weekly newspapers, monthly periodicals, and other publications. The leading dailies are the *Public Ledger*, the *Record*, *Press*, *North American*, *Times* and *Evening Star*.

CHURCHES AND INSTITUTIONS.—There are over 600 churches in Philadelphia and hundreds of charitable associations. The leading hospitals are the Pennsylvania, and the Insane, State, Municipal, Orthopædic, Children's, Women's, Wills', German, Jewish Episcopal, Presbyterian, St. Joseph's and St. Mary's and the Homeopathic. There are numerous homes for the aged, orphanages, and other homes. The most noted cemetery is Laurel Hill.

HOTELS, CLUBS, THEATERS.—The leading hotels are the Stratford, Bellevue, Lafayette, Colonnade, Continental, Aldine and Bingham. The most prominent clubs are the Philadelphia, Union League, University, Columbia, Art Club, New Century, Catholic, and Schuylkill Navy Athletic Club. The principal theaters are the Academy of Music, Arch Street theater, Chestnut Street opera house, Chestnut Street theater, Broad Street theater, Park, Walnut Street theater, Lyceum, Germania, and National theaters.

COMMERCE.—The value of the imports of foreign merchandise in 1896 was $39,807,278; of exports of domestic merchandise, $42,776,884. The city has several lines of European and coastwise steamships. The principal railroads are the Pennsylvania, the Philadelphia and Reading, both with several divisions, the Philadelphia, Wilmington, and Baltimore, the Philadelphia, Reading, and New England, the Philadelphia, Newton, and New York, the Baltimore and Ohio, the Atlantic City, and the West Jersey and Seashore.

MANUFACTURES.—The city ranks next to New York in the value of its manufactures. In 1890 the U. S. census reported for Philadelphia 18,166 manufacturing establishments, employing $375,249,715 capital and 260,264 persons, paying $135,917,021 for wages and $311,645,804 for materials, and having a combined output valued at $577,234,446. The principal industries in the order of value of output were the refining of sugar and molasses, $46,598,524; foundry and machine shop products, $29,554,444; men's clothing, $23,264,135; carpets and rugs, $22,000,000; woolen goods, $21,919,781; hosiery and knit goods, $14,932,981; printing and publishing, $13,397,217; cotton goods, $11,514,601; morocco, $10,840,198; malt liquors, $10,506,692; chemicals, $9,674,910; slaughtering and meat-packing, $9,146,513; petroleum refining, $8,646,952; and silk and silk goods, $8,059,604.

BANKING AND INSURANCE.—Philadelphia does not make as large a showing in the number of national, state and savings banks as would be expected in a city of its size, because it contains more building and loan associations than any other city in the country and has a large number of trust companies, both of which classes of institutions practically do a discount and savings business. There are 41 national banks, with a combined capital of $21,965,000, deposits $92,469,874, and reserve $27,960,638; about the same number of trust companies, with a larger aggregate capital; 20 life, fire, and marine insurance companies, and over 400 building and loan associations of purely local organization.

GOVERNMENT.—The municipal government consists of a mayor, elected for four years, the select council of 37 members (1895), representing the 37 wards of the city, chosen for 3 years, and the common council of 120 members, elected for 2 years. The new charter of 1887 greatly increased the power of the mayor and consolidated the municipal departments under the heads of public works, public safety, charities, and correction, finance, law and education. The directors of the first three departments are appointed by the mayor; the heads of the finance and law departments are elected. Each ward has a local board of education and there is a central board for the whole city. The United States District Court for the Eastern District of Pennsylvania, the United States Circuit Court for the Third Circuit and the Supreme Court are held in Philadelphia. There are also courts of common pleas with 12 judges, orphans' court with 4 judges, and over 25 magistrates. The net debt in 1896 was $35,625,071; assets above sinking funds, $8,145,859; assessed valuation of real and personal property, $818,827,549.

WATER.—Water is supplied mainly from the Schuylkill river, and the total capacity of all the reservoirs is one billion gallons, to be increased by a new reservoir with a capacity of 400,000,000 gallons. The present pumping capacity of the various stations is over 200,000,000 gallons daily, and the daily consumption is over 150,000,000 gallons. The principal water-works are picturesquely situated in Fairmount park. The gas-works are controlled by the city, and have a daily manufacturing capacity of twenty million cubic feet. The city is well equipped with electric lights and with electric and cable street railroads.

MILITIA.—The militia includes the 1st, 2d and 3d regiments of the Pennsylvania National Guard, Battery A, the First Troop of City Cavalry, the State Fencibles, the Gray Invincibles, and the Hartranft Light Battery.

MARKETS.—Philadelphia is famed for the excellence of its markets, the finest of which is the Farmers' market, located beneath the Reading terminal station.

POPULATION.—In 1683 the population was 500; 1700, 4500; 1778, 21,767; 1860, city and co., 565,529; 1870, 674,022; 1880, 847,170; 1890, 1,046,964.

See Proud's *History of Pennsylvania* (Phil., 1797); Watson's *Annals* (Phil., numerous editions); Scharf and Westcott's *History of Philadelphia* (Phil., 1887); Allinson and Penrose's *Philadelphia* (1681–1887); *A History of Municipal Development* (Phil., 1887); Day's *Historical Collections of Pennsylvania* (Phil., 1843).

PHILADELPHUS, a genus of shrubs, containing the mock orange or syringa, belonging to the order *saxifragaceæ* or saxifrage family, and tribe hydrangieæ, which also includes the genus hydrangea. In philadelphus the calyx tube is top-shaped and coherent with the ovary. Petals rounded or obovate, large, convolute in the bud. Stamens 20 to 40; styles 3 to 5, united below or nearly to the top; stigmas oblong or linear: pod 3 to 5 celled, when opening, splitting into as many pieces. Seeds very numerous, attached to thick placentæ projecting from the axis. Leaves opposite, often toothed; no stipules; solitary, cymose; clustered, snowy white, or cream-colored flowers. There are several species, natives of the southern Atlantic and Pacific states and Japan, and several varieties have been produced by cultivation. *P. inodorus*, growing in the mountains of Virginia and southward, has ovate leaves, pointed, entire, or with some spreading teeth; flowers single or few at the ends of the branches; pure white, and inodorous. *P. grandiflorus* has larger flowers, and is a tall shrub with long recurved branches; grows in Virginia and southward, near the mountains. It is often cultivated in gardens. *P. hirsutus* grows in Tennessee and North Carolina. It has small, pointed, hairy leaves, and solitary flowers, or only two or three together. A species growing in Oregon, called *P. gordonianus*, is probably a variety of *hirsutus*. On the Pacific coast are also found *P. Californicus* and *P. Lewisii*. The most common and best representative of the genus, however, is *P. coronarius*, or the common mock orange or syringa much cultivated in gardens for a long time. Its native country is not known; it has been referred to Japan and also to southern Europe. It has erect branches, oblong ovate leaves, which when crushed have very much the odor and taste of cucumbers. Its cream-colored flowers, borne in large clusters, are well known for their exceeding fragrance.

PHI'LÆ, the name of a celebrated island lying in the midst of the Nile, s. of Syene, beyond the frontier of Egypt, in 24° 1′ 28″ n. lat. It was called by the Egyptians Pae-lak, the place of the cataract; or *Menuab*, the abaton or sanctuary; and by the Copts, pilak or "cataracts." It is a small granite rock, about 1000 ft. long, and 200 ft. broad, on which is placed a suite of buildings, not of the most remote antiquity, but distinguished for great architectural beauty. The oldest of these, consisting of a hypœthral or roofless hall, was built in the reign of Nectanebus I., 377–357 B.C. A second mention of the same monarch occurs on the first propylon, where a door, constructed in his reign, has been incorporated into the constructions by a later Ptolemy. Both these are dedicated to the goddess Isis, who in Philæ was venerated as Athor or the Egyptian Venus. The principal remains consist of the great temple of Isis erected by Ptolemy II. or Philadelphus, and continued by his successors, especially by Ptolemy III., Euergetes, 247–222 B.C.

The temple consists of a shrine or sekos, a pronaos, an open portico, and two pylons or gateways. Both of the propylons were constructed by Ptolemy VII., or Philometer, and Lathyrus; but the first was added to it by Ptolemy IX., or Euergetes II., 145–141 B.C. On the second pylon, the monarch is represented slaying the hostile nations. The colonnade was principally erected by Tiberius. The charming little temple, the Mastabat el Pharaoun, or Pharaoh's bed of the Arabs, was made in the reign of Trajan, 100 A.D. The temples are particularly important as containing the principal representations of the story of Osiris, his birth, bringing-up, death, and embalmment by Isis. Commenced in the reign of Nectanebus I., and continued by the Ptolemies and Romans, the worship of Isis lingered here till 453 A.D., or sixty years later than the edict of Theodosius. After the subjection of the Blemmyes to the Nubian Christians, the temple was converted into a church, and the paintings daubed with mud; and, in 577 A.D., the bishop Theodorus changed the pronaos of the temple of Isis into the church of St. Stephen; and a Coptic church, at a later period, was built out of the ruins. The whole area of the ancient temple was about 435 ft. long by 135 broad, in the center of the dromos. At the present day the island is deserted. It is a favorite resort of travelers ascending to Nubia, and is one of the best of the remaining ruined sites of ancient Egypt.

Pliny, N. H., v., c. 29. Servius, *Æneid*, v. 154; Jones and Goury, *Views on the Nile;* Wilkinson, *Modern Egypt*, ii. 295–303; Brugsch, *Reiseberichte aus Ægypten*, p. 256; Lepsius, *Reise*, p. 262.

PHILANTHROPY, a word formed from the Greek, and signifying the "love of mankind." In the history of German school education it has acquired a special meaning. The influence exercised by Rousseau was not less great on education than on politics, and was as visible in the pedagogues of Germany and Switzerland as in the men of the French revolution. It is to the brilliant and one-sided advocacy by the author of *Emile*, of a return to nature in social life and in the training of the young, that Basedow owed

his novel and enthusiastic educationalism. A brief notice of the institution, which was opened under his auspices at Dessau in 1774, and which was called *Philanthropin*, is given in the article on Basedow. Other establishments of the same kind were founded in different parts of Germany, but the only one which still survives is Salzmann's institute at Schnepfenthal, in Gotha, opened in 1784,

PHILARET (Basil Drozdoff), 1782–1867; b. at Kolouma; received his education in the theological seminary of Moscow; was tutor of Greek and Latin; appointed in 1806 preacher at the Sergian monastery of Troizka; transferred in 1810 to the academy of Alexander Newskj; in 1811 was made archimandrite; in 1812 became rector of the St. Petersburg theological academy; in 1817 was made bishop; and occupied successively the see of Twer, Iaroslaw, and Moscow. He remained in the see of Moscow, to which he was appointed in 1821, until his death. He was renowned for his eloquence, learning, statesmanship, and liberality of mind. The Russian rulers made him confidential adviser in all important questions. To him is ascribed the manifesto which led to the abolition of serfdom. In 1813 he received from Alexander I. a decoration for his oratory. Many of his sermons and lectures have been printed, and translated into foreign languages. His greatest work, the *History of the Russian Church*, published 1850–59, was introduced by order of the holy synod into the ecclesiastical seminaries. Besides this history and various commentaries, he published *A System of Christian Doctrines*, 2 vols. *The Liturgy of the Russian Church before the Invasion of the Mongolians; A Work on the Church Fathers*, 3 vols.; *An Outline of the Theological Literature of Russia.*

PHILATELY, the fancy for collecting and classifying postage-stamps. The word was formed in 1865 by M. Herpin from two Greek words, signifying love of that which frees from tax. Undertaken first as a pastime, useful in its relation to geography, philately has in twenty-five years grown to such an extent that more than seventy periodicals and catalogues on the subject are published, many philatelic societies have been established, and collections of stamps are valued at enormous sums; for example, the Galliera collection, at Paris, is said to have cost 1,440,000 francs. As an instance of the value of single stamps, a Brattleboro' stamp of 1846 is held by a London dealer at $1250.

Stamped or post-paid paper was used in Paris as early as 1653, when M. De Velayer established a postal system by means of envelopes franked by bonds of paper. In 1758, stamps similar to those now in use were introduced, but were seldom used, and were soon entirely forgotten. The next country to introduce stamps was Spain, in 1716; but these were used on official letters only, and at the beginning of this century were abandoned. Semi-official stamped envelopes were issued in Italy (Sardinia) in 1818. These also were little used, and were finally withdrawn in 1836. These stamps were octagonal in shape, with the device of a mounted post-boy. But practically the history of the postage-stamp begins in England with the reforms of Sir Rowland Hill. He proposed the use of an adhesive postage-stamp to the commissioners of the post-office inquiry, in Feb., 1837, and the plan was finally adopted, May 6, 1840. An adhesive stamp was made experimentally by Mr. James Chalmers in his printing-office, at Dundee, in 1834, but this was not made public by him till Nov., 1837; whereas Sir Rowland Hill proposed his stamp in February of that year. In 1840, Mulready's envelope was introduced, bearing an allegorical design of England attracting the commerce of the world; but after a few months this was superseded by the adhesive stamp. The design for the first stamp was made by Heath, of London, and was similar to that used at present. The first issue was a one-penny stamp, in black, and since then more than forty issues have been made, ranging in value from £5 to a halfpenny. The majority of the portraits of the Queen found on the English stamps were designed from a bust made over forty years ago. The only accurate portrait appears on the Canada revenue-stamp, and is taken from a photograph. Zurich was the first foreign country to issue stamps, in 1843, the other cantons following, from 1843 to 1849, when the Federal stamps were issued for the French and German cantons. These were current till 1854, when a uniform type, with values in centimes, rappen, and centesimi was introduced, replaced in 1862 by a new series bearing the name Helvetia. Postage-stamps were adopted in Brazil in 1843. The first issues were simply the values in large figures in an oval. Stamps bearing the portrait of Pedro II. were issued in 1866; superseded in 1890 by the stamp of the republic—five stars on a medallion—similar to an issue of 1887, but with the inscription U. S. of Brazil. Stamped envelopes were introduced in Russia in 1845. In 1856, adhesive stamps were issued in the province of Finland, a few months before the general issue for the empire in 1857. The Russian stamps bear the imperial eagle and crown, but never the head of the emperor. From 1858 to 1864, Poland issued stamps differing but little from those of the empire, but these are now obsolete. Many varieties of Russian local stamps exist, some of which are of curious designs and are very scarce.

Local stamps were in use in various cities in the United States as early as 1842—in New York, St. Louis, Baltimore, and Brattleboro'. The first stamp issued in New York was the City Dispatch, followed shortly by many others; the best known of these New York locals is Hussey's, which was issued as late as 1882. The first general issue was made in 1847, in two values of five and ten cents, bearing respectively the heads of Franklin and Washington. These were replaced in 1851 by three new values—one, three, and twelve cents—the five-cent stamp of this issue bearing the head of Jefferson. From this time to

1860 a complete series was issued, in values from five to ninety cents. A new set was issued in 1861, with slight changes; and in 1869 an entirely new series was brought out in various designs: a horseman, locomotive, eagle, steamship, Landing of Columbus, Declaration of Independence, and heads of Franklin, Washington, and Lincoln. The series of 1870 to 1872 bore heads of Franklin, after Rupricht's bust; Jackson, after Powers; Washington, after the bust by Houdon; Lincoln, after Valk; Stanton, from a photograph; Jefferson, after Powers's statue; Clay, after the bust by Hart; Webster, after the Clevinger bust; Scott, after the bust by Coffee; Hamilton, after Cerrachi, and Perry, from Wolcott's statue. In 1875 a five-cent stamp was issued for foreign postage, bearing the head of Jackson, taken from a photograph; and in 1882 another of the same value, with the head of Garfield, after a photograph. The issue of 1888 was the same as that of 1872–83. The stamps of the issue of 1890 are smaller than those formerly used, and bear the heads of Franklin, Washington, Jackson, Lincoln, Garfield, Jefferson, and Perry, after the designs previously used, with the addition of the heads of Webster and Clay, after daguerreotypes, and of General Grant, after a photograph. Stamped envelopes were introduced in 1853, engraved by Nesbitt & Co., of New York, in values from one to forty cents, and bearing profiles of Washington, Franklin, and Jackson. In 1870 the contract was given to G. H. Reay, who brought out eleven values—from one cent to ninety—with a separate design for each, in addition to the three already in use—the profiles of Lincoln, Jefferson, Clay, Webster, Scott, Hamilton, Perry, and Stanton. Since 1874 stamped envelopes have been manufactured by the Plimpton Company, of Hartford.

An interesting series of special stamps are the official stamps of the various departments: Executive, Interior, Justice, Navy, War, State, Treasury, Agriculture, and Post-Office. These are of the same design as the general issue, with the name of the department above, with the exception of the Post-Office stamps, which bear numeral of value and official stamp in oval, with name of department above. Newspaper and periodical stamps for the use of publishers were issued in 1865, and range in value from one cent to sixty dollars. The stamps are of elaborate designs and beautiful workmanship, but never pass through the mails, being cancelled and kept in the Post-Office Department as vouchers for postage paid. In 1893, a special series of large stamps in honor of the Columbian celebration appeared.

In 1879 postage-due stamps were introduced. These are all of one color—red-brown—and vary only in the numerals of value—from one to fifty cents. Seal stamps are issued for packets of registered letters and for unsealed letters. The most recent stamp is the special delivery stamp, issued first in 1885. The design is a messenger-boy, and the value is ten cents. This brief review of the history of postage-stamps in the United States would hardly be complete without a reference to the use of postage-stamps as currency during the war. In 1862 silver and small change had disappeared from circulation, and their place was filled in great measure by postage-stamps, which later were put up in small envelopes, with amount printed outside. Finally, the stamp was enclosed in a thin brass case, with a front of mica showing the stamp. These were superseded by the government issue of stamps printed in the form of small bank bills, and known as postage currency.

Among the most historical stamps are those issued by the Confederate states during the war. Provisional stamps were issued in 1861 by the post-masters of the various towns; and these poorly-made stamps and envelopes, often of no better material than wall-paper or newspaper, tell the story of the sufferings and privations of those days. The general issues were made in 1861 to 1863, bearing heads of Confederate leaders, and ranging in value from two to twenty cents.

Stamps were introduced into France by the republic in 1849. The first series bore the head of the goddess of Liberty. The next series, issued in 1852 by the presidency, bore the head of Napoleon. The stamps of 1853, after the establishment of the empire, bear the same device, but the inscription is changed to Empire Français. In 1863, a laurel wreath was added to the head of Napoleon. These were current till the fall of the empire, in 1870, when the republic issued a new set similar to those of 1849. In 1876, the present design of two full-length figures was introduced and used in all subsequent issues. The special stamps for the French colonies represent a seated figure leaning on an anchor.

Stamps were issued in Belgium, in 1849, bearing the bust of King Leopold I. in uniform. Since that time there have been more than fifteen issues, all showing the national arms, or portrait of the sovereign. The first stamp used in Germany was issued in Bavaria in 1849. This was a plain, inartistic stamp, and was replaced in 1867 by one bearing the royal arms. The first Prussian stamp was issued in 1850, bearing the bust of the king, and followed in 1861 by the Prussian eagle. Stamps were issued by the smaller German states from 1850 to 1868, when all were replaced by the stamp of the North German Confederation. This, in 1871, gave place to the stamp of the German empire. At present only Bavaria and Würtemberg retain their special postage-stamps. The first Austrian stamp appeared in 1850, and bore the imperial arms. The emperor's head appeared first in 1858, and from that time alternates with the imperial eagle. Special stamps for Hungary were issued in 1868. The postal-card originated in Austria, and appeared in 1869.

Stamps appeared in Italy (Sardinia) in 1851, bearing the head of the king, and in the other states, as follows: In Modena, Parma, and the Roman states in 1852, and in the Two

Sicilies in 1858 and 1859. These were gradually replaced by the stamp of Italy, as the states were united.

Stamps were introduced in Spain in 1850. With the exception of one year, when the royal arms were substituted, every issue bore the portrait of Isabella II., till her dethronement in 1868. In 1870 a new series was issued, with the head of the goddess of Iberia. In 1872 this was replaced by the portrait of Amadeus, followed by that of Alfonso XII., in 1875; and in 1889 the head of the present young king appeared. There is also an interesting series of Carlist stamps, issued from 1873 to 1875.

Stamps were introduced in the smaller European countries in the following order: Denmark, 1851; Netherlands, 1852; Portugal, 1853; Norway, 1854; Sweden, 1855; Roumania, 1858; Romagna, 1859; Malta, 1860; Greece, 1861; Turkey, 1863; Servia, 1866; Heligoland, 1867; Azores, 1868; Iceland, 1873; Montenegro, 1874; San Marino, 1877; Bulgaria, 1879; Cyprus, 1880; Eastern Roumelia, 1881; Gibraltar, 1886, and Monaco, 1885.

The first stamps used in Asia were introduced in 1850, in the Scinde districts, under the administration of Sir Bartle Frère. The following table gives the date of the introduction of postage-stamps in the different countries of Asia:

YEAR.	Countries.	YEAR.	Countries.
1854....	India.	1880....	Rajpepla, Nabha.
1857....	Ceylon.	1881....	Nepaul.

Stamps were first used in Canada, 1851, and in New Brunswick in the same year; in Newfoundland and Nova Scotia in 1857; in 1860 in Prince Edward's Island (and in British Columbia and Vancouver Island in 1861). In 1868 all these postal departments were consolidated, and one set of stamps, in values from one to fifteen, was issued for the whole Dominion.

The French possessions, St. Pierre and Miquelon, issued stamps in 1885.

An interesting feature of philately is the surcharged stamp, issued by various governments to supply a temporary lack of regular issues; and as they became comparatively rare in a short time they increased largely in value. Especially interesting are the early surcharges of Barbadoes, Cuba, Fiji Islands, Mauritius, Natal, etc. It is probably to Mauritius that we owe the idea of surcharging new values. In 1858, the post-master, needing a fourpenny stamp, placed that value on a shilling stamp, and the custom was quickly followed by other countries.

In conclusion, a short account of the manufacture and distribution of postage-stamps in the United States may prove interesting. The white paper on which the stamps are printed is first counted at the paper-mill, then shipped to the government office connected with the manufactory, where it is counted twice by government employés and stored. The contractor takes each day the required number of sheets, counting them again twice. Two hundred stamps are printed on each sheet; the sheets are then sent to the drying room. The next process is gumming, which is done by an automatic machine, which not only thoroughly gums, but dries the sheets. Each sheet is then placed between pasteboards, and for several hours subjected to heavy pressure. They are counted again, and sent to the perforators, who first divide each sheet into two, of one hundred stamps each, and then perforate them in the spaces between the rows. These sheets are again pressed, then counted and made into packages of 2000 sheets (200,000 stamps). The stamps are then counted by two persons and placed in the vault ready for circulation. All spoiled sheets are cancelled and forwarded to Washington for destruction.

Post-masters send their requisition for stamps to Washington; small offices being replenished once in three months, larger ones once in six weeks. The New York office orders from 18,000,000 to 20,000,000 about every 15 or 20 days The number of stamps issued for the year ending June 30, 1890, was 2,225,000,000.

PHILBRICK, John Dudley, ll.d., b. N. H., 1818; educated at Dartmouth, and after graduating in 1842, taught school for many years. In 1853 he became principal of the Connecticut normal school; in 1855 superintendent of schools in that state, and in 1857 superintendent of the Boston public schools. He was sent to the Vienna exposition of 1873 as educational commissioner from Massachusetts, and acted as a member of the international jury. After his return he became president of the national teachers' association, was officer of many educational societies, wrote many papers on the subject, and edited the Connecticut *Common School Journal* and the *Massachusetts Teacher*. He d. 1886.

PHILEMON, b.c. about 360–262, b. Soli, Cilicia; settled at Athens in early youth; became the rival of Menander in dramatic writing. His comedies found in all the best editions of Menander, are distinguished for lively wit, which gained them much popular favor, and for ingenuity, and skill in delineating character. They numbered 97 titles; 53 of which have been preserved in the *Bibliotheca Græca*, of Fabricius. He is said to have retained a peculiarly sunny temper throughout his long life, and the popular belief is that he died laughing at a ludicrous incident. He began to place his plays on the stage before the 113th Olympiad. He died in the reign of the 2d Antigonus son of Demetrius. The best edition of his works is that of Meineke, Berl., 1823, *Theatre of the Greeks*. His son Philemon the younger, was a comic poet and wrote 54 comedies.

PHILE'MON AND BAU'CIS, according to a classic myth, finely poetized by Ovid in his *Metamorphoses*, were a married pair, remarkable for their mutual love. Jupiter and Mercury, wandering through Phrygia in human form, were refused hospitality by every one, till this aged pair took them in, washed their feet, and gave them such humble fare as they could provide. On going away, the gods took them with them to a neighboring mountain, on looking from which they saw their village covered with a flood, but their own cottage changed into a splendid temple. Jupiter permitted them to make any request they chose, but they only asked to be servants of his temple, and that they

might die at the same time. When, accordingly, they were seated at the door of the temple, being now of great age, they were changed, Philemon into an oak, and Baucis into a linden. They felt the change taking place, and so long as the power remained with them, looked most tenderly upon one another.

PHILEMON, EPISTLE OF PAUL TO, is the shortest of the four extant letters which the apostle wrote from Rome during his captivity. We either directly learn, or legitimately infer from its contents, that Philemon, who probably lived at Colossæ, was a man of considerable wealth, the head of a numerous household, and liberal to the poor. He had possessed a slave called Onesimus, who had run away from him, after—it has been thought (verse 18)—robbing or defrauding him. Onesimus, however, coming to Rome, had been brought into contact with Paul, and converted to Christianity. At first the apostle thought to retain him as his personal attendant, for he was now, as he tells us (verse 9), "Paul the aged;" but on further consideration, he resolved to send him back to his former master. The epistle is simply a brief letter, begging Philemon to pardon Onesimus, and to receive him "not now as a servant, but above a servant, a brother beloved." It exhibits an exquisite tenderness and delicacy of feeling, with all that tact and subtlety of address by which Paul was wont to find his way into the innermost heart of men. The historical evidence of its authenticity is complete. Even Baur has remarked that modern criticism in assailing this particular book runs a greater risk of exposing itself to the imputation of an excessive distrust—a morbid sensibility to doubt and denial—than in questioning the claims of any other epistle ascribed to Paul.

PHILIP, the Apostle, of Bethsaida, one of the earliest disciples of Christ; was distinguished by his confident testimony to Nathanael, and his successful plea with him, notwithstanding his prejudice against Nazareth, to come and see Jesus and judge for himself; was chosen one of "the twelve;" was questioned by the Lord, prior to the feeding of the 5,000, to test his faith; and again, before the crucifixion, to increase his knowledge; was joined with Andrew in bringing Greek inquirers to Jesus; and was one of "the eleven" in their assemblage after the resurrection and at pentecost. The traditionary notices of him are numerous; but some of them confound him with Philip the evangelist, and the rest are uncertain or false.

PHILIP THE MAGNANIMOUS, Landgrave of Hesse, 1504–67, b. Marburg; succeeded his father, William II., in 1509, his mother being made regent. He was one of the first to adopt the cause of the reformation, and was a member of the Smalcald league defeated by Charles V., 1546, in the battle of Mühlberg. Philip was retained as a prisoner, but released on the demand of his son-in-law, Maurice of Saxony. He was married in 1523 to a daughter of George the Bearded, duke of Saxony, and by her had four sons between whom he divided his landgraviate. But a secret marriage to Margaret von der Saale, a Protestant, in 1540, was assented to by Luther and Melanchthon on the ground that the former marriage was adulterous.

PHILIP II., King of Macedonia, and father of Alexander the Great, was b. at Pella in 382 B.C. He was the youngest son of Amyntas II. and Eurydice. At Thebes, whither he was taken as a hostage by Pelopidas, he spent part of his early life, employing his exile in studying the art of war, and the constitution and laws of the Greek states, as well as the literature and the character of the people—pursuits which were of the greatest service to him afterward, when called on to administer the government of the Macedonian kingdom. The assassination of his eldest brother, Alexander II., by Ptolemy Alorites, after a short reign of two years (369–367 B.C.), and the death of his second brother, Perdiccas III., in battle (360 B.C.), placed him at the head of affairs in Macedonia, as guardian to his nephew Amyntas, still an infant. In a few months Philip made himself king, the rights of Amyntas being set aside. Dangers soon beset him from without and from within. The Illyrians and other neighboring tribes assailed his kingdom on different sides; while two pretenders to the throne, urged on by the Athenians and Thracians, stirred up civil commotion. But foreign and domestic enemies soon disappeared before the decision, the energy, and the wise policy of the young king. In the brief space of a year he had secured the safety of his kingdom, and had gained for himself a dreaded name. At this time he was only 24 years of age. Henceforward his policy was one of aggression, and his every thought was directed to the extension of his empire and the spread of Macedonian influence. The Greek towns on the coast of Macedonia were the first objects of attack. After possessing himself of Amphipolis and Pydna, by means little consistent with the faith of treaties, he handed over to the Olynthians the city of Potidæa, which he had taken from the Athenians. In Thrace he captured the small town Crenides, which, under its new name, PHILIPPI, soon acquired great wealth and fame, and ultimately became celebrated in profane as well as in sacred history. The surrounding district was rich in gold-mines, which proved a source of great revenue to Philip (about $1,000,000 annually), and supplied him plentifully with the means of paying his armies, of bribing traitorous Greeks, and of opening the gates of many cities, the sieges of which might otherwise have cost the blood of thousands. After a few years of comparative leisure, he turned his ambitious views southward; and capturing Methone (at the siege of which he lost an eye), he advanced into Thessaly, and ultimately to the strait of Thermopylæ, which, however

he did not attempt to force, as it was strongly guarded by the Athenians. He therefore returned into Macedonia, and directed his arms against the Thracians, waiting for a more fitting occasion to carry out his darling project. Such an opportunity was not long wanting. After capturing all the towns of Chalcidice—the last of which was the important city of Olynthus—he made peace with the Thracians, and next year with the Athenians, who had been at war with him in defense of their allies the Olynthians. It was this siege of Olynthus by Philip which called forth these Olynthiac orations of Demosthenes, which are still admired as efforts of oratorical genius hitherto unequaled in any country. Philip was now requested by the Thebans to interfere in the war ("the sacred war") which was raging between them and the Phocians. He marched into Phocis, destroyed its cities, and sent as colonists to Thrace many of the inhabitants (346 B.C.). The place which the Phocians had occupied in the amphictyonic council was transferred to Philip, and he was appointed, jointly with the Thebans and Thessalians, as president of the Pythian games. His next step was to secure a footing in the Peloponnese, by espousing the cause of the Argives, Messenians, and others, against the Spartans. In 339 B.C. the amphictyonic council declared war against the Locrians of Amphissa; and, in the following year appointed Philip commander-in-chief of their forces. The Athenians were alarmed at his approach into Greece in this capacity, and formed a league with the Thebans against him; but their united army was utterly defeated at the battle of Chæronea (338 B.C.), and all Greece was at the feet of the conqueror. He was now in a position to enter on the great dream of his later years—viz., to invade the Persian empire, and revenge the injuries of Greece. Deputies from the different states of Greece assembled in congress at Corinth; and after resolving to make war on the Persian king, chose Philip as leader of their armies. Preparations were in progress for this great expedition when he was suddenly cut off by the hand of the assassin Pausanias, at a festival celebrating the marriage of his daughter with Alexander of Epirus (336 B.C.). A private grudge at Philip, for neglect to punish an insult offered to Pausanias by Attalus, was said to be the motive which inspired the murderer, though suspicion is not wanting that the deed was done at the instigation of Alexander and his mother Olympias, who had retired from the court in disgust at Philip's marriage, the year previous, with Cleopatra, daughter of Attalus, one of his generals. Philip was a man given to self-indulgence and sensuality; he was faithless in the observance of treaty obligations, and unscrupulous as to the means by which he gained his ends; but he had to deal with factious and faithless opponents, which may help to explain if it does not justify his policy; while his clemency as a victor has won the admiration even of the virtuous Cicero, who pronounces him "always great." Of his force and energy of character, his acuteness, fertility of invention, and eloquence, it is impossible to speak too highly. He was at the same time a lover of learning and a liberal patron of learned men. He reigned from 359 to 336 B.C.

PHILIP III., King of Macedon. On the death of Alexander the Great at Babylon in 323 B.C., the army elected as king, under the name of Philip III., Arrhidæus, son of Philip and Philinna of Larissa, one of his many wives. He was a youth of weak understanding, and was totally unfit for the duties of government. His wife Eurydice (daughter of Amyntas, son of Perdiccas III.), whom he married in 322 B.C., endeavored, on their return to Macedonia, to oppose the measures of Polysperchon and Olympias in support of the young Alexander, posthumous son of Alexander the Great and Roxana. But her army was defeated; she herself was taken prisoner; and, along with her husband, was put to death in 317 B.C.

PHILIP V., King of Macedon, B.C 237–179: b. Macedonia; grandson of Antigonus Gonnatas; ascended the throne 220 B.C., on the death of his uncle Antigonus Doson. His reign began with the disturbances between the Ætolian and Achæan leagues, in which he aided the latter, and he was distinguished for activity and military skill. He carried on a successful war with Rome, called the first Macedonian war (B.C. 210–205), unassisted by Hannibal, whose offers of alliance he slighted. In 200 the second Macedonian war began; ending in 197, during the reign of his son Perseus, in the complete discomfiture of the Macedonian army by Titus Quintius Flaminius at Cynoscephalæ. The country sank into subjection to Rome, surrendering all its possessions in Europe and Asia; their fleet being seized by their conquerors, and tribute exacted. His death took place just before the last crisis.

PHILIP II., King of Spain, the only son of the emperor Charles V. (q.v.) and Isabella of Portugal, was b. at Valladolid, May 21, 1527. He was brought up in Spain, and carefully educated under the superintendence of able tutors, by whose instructions he greatly profited, becoming an accomplished linguist and mathematician, and a connoisseur in architecture and the fine arts. But all attempts to indoctrinate him with the chivalric ideas of the time were utterly futile. From his very childhood he was distrustful and reserved; he invariably spoke with slowness and an air of deep reflection which was too marked to be wholly real, and exhibited in his manners a *sang-froid* which even in his early years was rarely disturbed by ebullitions of passion. While still very young he was intrusted, under the direction of a council, with the government of Spain, and in 1543 he espoused Mary of Portugal, who died three years after. In 1548 he went to join his father at Brussels, and there adopted the multitudinous equipage

and minute and pompous etiquette of the late Burgundian court, which from this time he retained. While at Brussels, Philip was presented to his future subjects, and was at the same time fully initiated into his father's policy, the two chief items of which were the maintenance and extension of absolute rule throughout his dominions, and the support and propagation of the Catholic religion. In 1554 he married Mary Tudor, queen of England, and to gain the support of that country to his political projects, and at the same time restore it to the Roman Catholic pale, he laid aside his ordinarily cold and haughty demeanor, and labored to ingratiate himself with his wife's subjects, taking the utmost care to avoid exciting the national jealousy of foreign influence. But his plans were discovered and frustrated, and this disappointment, combined with the annoyance to which he was subjected by the jealousy of his wife, prompted him to leave England (which he did forever), and return to Brussels (Sept., 1555). In the following month he became, by the abdication of his father, the most powerful potentate of Europe, having under his sway, Spain, the two Sicilies, the Milanese, the Low Countries, Franché Comté, Mexico, and Peru; his European territories being more fertile, and their inhabitants more wealthy and prosperous than any others on the continent, while his army was the best disciplined, and headed by the greatest generals of the age. The treasury alone was deficient, having been drained by the enormous expenditure of his father's wars. Philip was eager to begin the crusade in favor of Catholicism, but he was compelled to postpone it, owing to a league which had been formed between France, the pope, and the sultan, to deprive him of his Italian dominions. He soon got over his religious scruples at engaging in warfare with the pope, and intrusted the defense of the Sicilies to Alba (q.v.), who speedily drove out the pope and the French, and conquered the papal territories, while Philip himself vigorously prosecuted the war against France in the n., and defeated the French at St. Quentin (q.v.) (Aug. 10, 1557) and Gravelines (July 13, 1558). These reverses forced the French (the pope having already made a separate treaty) to agree to terms of peace at Chateau-Cambresis (April 2, 1559.) Philip's wife was now dead, and after an unsuccessful attempt to obtain the hand of her successor, queen Elizabeth, he espoused Isabella of France, and returned to Spain, where from this time he always resided. Before leaving the Low Countries, he solemnly promised to withdraw almost the whole of his Spanish troops who preyed upon the peaceful Flemings, but he firmly refused to annul or modify the rigorous edicts of his father against heretics. His realm being now at peace, he resolved, as a necessary preliminary to the carrying out of his great proselytizing scheme, to replenish his treasury, a thing impossible without forced contributions, which, at that time, could only be obtained in those countries over which he held absolute rule—viz., Spain and America. He therefore set about establishing absolute government in those of his states that were in possession of something like free institutions, and with this view sought to introduce the inquisition into the Low Countries and Italy. But the introduction of this instrument of tyranny was successfully resisted in Naples and the Milanese; in Sicily its powers were so shackled as to render it quite a harmless institution; but these failures only stimulated him the more to establish it in all its pride and power in the Low Countries. For a number of years it continued in vigorous action in that country; but the natural result of such a course of conduct was a formidable rebellion of all classes, Catholic and Protestant, which was partially successful—the northern portion (the "seven united provinces") establishing its independence in 1579. In this conflict the resources of Spain were largely expended, and to replenish his treasury in the speediest manner possible, Philip exacted enormous contributions from Spain, abolishing all special communal or provincial privileges and rights which might interfere with his actions, and suppressing all insurrection and discontent by force of arms or the inquisition. During the first half of his reign he engaged in a desultory warfare with the Barbary corsairs, who were supported by the Turks—the only memorable incident of which was the famous naval victory of Lepanto (q.v.), won Oct. 7, 1571. In 1580 the direct male line of Portugal having become extinct, Philip laid claim to the throne, and after the duke of Alva had occupied the kingdom with an army, the Spanish monarch's title was recognized by the Portuguese estates. His enmity to England on account of the anti-Spanish policy of queen Elizabeth incited him to attempt the conquest of that country, but his most formidable attempt failed signally. See Armada. After the accession of Catharine de Medicis to power, France and Spain drew closer the bonds of amity which had previouly subsisted between the two countries; but the refusal of Catharine to adopt Philip's plans for the wholesale slaughter of heretics produced a coolness in their relations. However, when Henry, king of Navarre, a Huguenot, became heir-presumptive to the throne, Philip allied himself with the Guises and the other chiefs of the Catholic party who were in rebellion, and his obstinate persistence in these intrigues after the cause of the Guises was shown to be hopeless, prompted Henry to declare war against him. The Spaniards had the worst of it, and Philip was glad to conclude the treaty of Vervins May 2, 1598. He died in the Escurial at Madrid, on Sept. 13 of the same year. His third wife, Isabella, d. in 1568, and his fourth, Anne of Austria, who was also his niece, whom he married 1570, d. in 1580. Philip had great abilities, but was visionary, and overtasked his resources, without leading to any good or profitable result. No single kingdom in Europe could have stood against him, but he was always at war with at least two at a time; and even the splendid opportunity which the extinction of the direct Capetian

line in 1589 gave him for uniting France, Spain, and Portugal in one great monarchy, could not restrain this unfortunate peculiarity. His fanatical enthasiasm for Catholicism, in which he was surpassed by no man who ever lived, and the zeal with which he persecuted all heretics through the inquisition, combined with the odious tyranny of his secular government to degrade Spain, by breaking the proud and chivalrous spirit which had been the source of its pre-eminence among European nations, while his virulent persecutions of the industrious Moriscoes, and his oppressive exactions, put a stop to the commerce of the country. By his fourth wife, Anne of Austria, he had a son, Philip III., whose daughter, also Anne of Austria, married Louis XIII. of France.

PHILIP V., King of Spain, and the founder of the Bourbon dynasty in that country, was the second son of the Dauphin Louis (son of Louis XIV.) of France, and was born at Versailles, Dec. 19, 1683. The last king of Spain of the Hapsburg dynasty, Charles II., had successively promised the succession to the throne to Charles, archduke of Austria, the great grandson of Philip III. of Spain, and to Philip, then duke of Anjou, the son of his own eldest sister; but becoming cognizant of a secret treaty which had been agreed to between England, France, and Holland for the partition of Spain, he, to prevent the dismemberment of his kingdom, left by will the succession to Philip of Anjou. France immediately seceded from the partition treaty, and, on the death of Charles II. in 1700, Philip, who was the favorite candidate among the Spaniards, with the exception of those in the eastern provinces, took possession of the kingdom (April 21, 1701); and, to gain over Savoy to his side, and thus create a diversion in Italy against Austria, he married Maria Louisa, daughter of Victor Amadeus. War almost immediately broke out between the rival claimants, Charles being supported by the "grand alliance," which included England, Austria and Holland, and subsequently (January, 1702) Prussia, Denmark, and Hanover (May, 1703), Portugal, and (October, 1703) Savoy. See SUCCESSION WARS, SPANISH. The fortune of war was mostly on the side of the allies; but France and Spain carried on the contest heroically, and, though at great sacrifices, the throne was secured to Philip by the peace of Utrecht (April 11, 1713). In the following year the queen died, and Philip espoused Elizabeth Farnese of Parma, who immediately induced her husband to commit the reins of government to Alberoni (q.v.); in fact, so much was the weak-minded king under the influence of his talented young wife, that he granted everything she asked. "He was," says Sismondi, "remarkable for good nature, he had few faults and as few virtues, his sentiments were just and honorable, but he was wholly deficient in energy; he had no taste for anything beyond devotional exercises and the chase; he was made to be governed, and he was so all his life." Alberoni's adventurous foreign policy, which at first succeeded in restoring the Spanish rule in Sicily and Sardinia, brought down upon Spain the wrath of the quadruple alliance (France, England, Holland, and Austria), and war was only averted by his being dismissed; but his dismissal was really produced by his neglecting to further the queen's pet scheme of providing sovereignties in Italy for her sons, who seemed to have little chance of obtaining the throne of Spain. The strong bond of union which had hitherto subsisted between Spain and France was broken, in 1725, by the refusal of the regent of the latter country to fulfill certain matrimonial agreements; but four years afterward the two countries joined with England and Holland against the emperor, and in 1731 Philip took measures to recover the old Spanish possessions in Italy. The war which followed at last satisfied the queen by giving the kingdom of the two Sicilies to her son Charles (1736), but Philip, in attempting to obtain still greater advantages over Austria, was led into a war of which he was not destined to see the result. He died at Madrid, July 9, 1746.

PHILIP, KING, Sachem of Pokanoket; d. 1676; named by the English Philip, though his Indian name was Pometacom. He became sachem in 1662, and the same year he went to Plymouth, and promised to continue friendly to the colony, and not to cede any territory without their knowledge. About 1670 his friendly intentions began to be suspected, frequent meetings of the tribes were held, murders of whites became frequent, and in 1671 it was attempted to disarm the Indians. But the war did not break out till 1675. An Indian convert named Sassamon, divulged to the colonists the preparations made by Philip, and was murdered. In revenge for the execution of his murderers, the Indians killed 8 or 9 men, and open hostilities were begun. The Indians did not venture to meet the colonists in battle, but burned settlements, laid ambuscades for the settlers, and killed the stragglers. In Dec., 1675, Josiah Winslow led a force of 1000 men against the Narragansetts, with whom Philip had formed an alliance, took by storm a fort said to have contained 4,000 Indians, and destroyed their village. The war went on for the first 6 months of 1676, but Philip's power was soon broken, he was tracked to Mount Hope, where a force under Capt. Church attacked him, and he was killed by an Indian in attempting to escape. His body was quartered, and his head sent to Plymouth, where it was kept on a gibbet for 20 years. During this war 600 colonists were killed, 600 buildings burned, and 13 towns destroyed. Its cost was estimated at $1,000,000. Plymouth and Massachusetts Bay suffered heavily.

PHILIPPE II., better known as PHILIPPE AUGUSTE, King of France, was the son of Louis VII. and Alix of Champagne, and was b. in Aug., 1165. He was crowned, in 1179, during the life of his father, succeeded him in 1180, and proved one of the great-

est monarchs of the Capetian dynasty. His marriage with Isabella of Hainault, a descendant of the Carlovingians, established more completely the right of his family to the throne of France. He first made war upon the count of Flanders to obtain the districts of Vermandois, Valois, Amienois, and Artois, which belonged to his wife, and, after various fortunes, obtained Amienois and part of Vermandois at once, and the rest after the count's death in 1185. By the advice of St. Bernard (q.v.) he rigorously punished heretics, despoiled the Jews, absolving their debtors of all obligations, excepting one-fifth, which he transferred to himself; put down with vigor the numerous bands of brigands and priest-haters who devastated the country and burned the churches and monasteries, compelling their chief leader, the duke of Burgundy, to submit (1186) to his authority—acts which gave him great popularity among his subjects. He sustained the sons of Henry II. of England in their rebellions against their father, and conquered, in conjunction with Richard Cœur-de-Lion, many of the English possessions in France. After the accession (1189) of Richard to the throne, Philippe and he set out together on the third crusade; but quarreled while wintering in Sicily, and this dissension continuing, Philippe, after a sojourn of 3½ months in Syria, set out (July 31, 1190) on his return to France, after taking a solemn oath to respect the integrity of Richard's dominions; but no sooner had he returned than he entered into an arrangement for the partition of Richard's territories in France with his unworthy brother John. Some acquisitions were made, but Richard's sudden return overset the calculations of the conspirators, and a war immediately commenced between the two monarchs, in which Philippe had at one and the same time to defend his territories from the English, and the counts of Champagne, Boulogne, Bretagne, and Hainault, who attacked them on all sides. In order to obtain money, he was obliged to rescind his edicts against the Jews; but the mediation of Pope Innocent put an end (Jan. 13, 1199) to a war which was productive of no other result than the exhaustion of the strength of the combatants. Richard of England died within two months after; but war almost immediately recommenced with England, regarding the respective claims of king John of England and his nephew Arthur of Bretagne to the French heritage of Richard Cœur-de-Lion, which consisted chiefly of Anjou, Maine, and Touraine. Arthur had applied for aid to Philippe, and the French king immediately responded by causing the young duke to be recognized in the above-mentioned provinces; but a quarrel in which he became involved with the pope on account of his having divorced his second wife, Ingelburga of Denmark, to marry Anges of Meran, a Tyrolese princess, compelled him to leave the English in possession for a little time longer. The defeat, capture, and subsequent murder of Arthur, however, again brought him into the field. The English provinces in France were attacked by the combined French and Bretons: Normandy and Poitou, with the three disputed provinces, were annexed to France; and the English dynasty in Bretagne dispossessed by a French one (Oct. 26, 1206). During 1211–14 Philippe engaged in a war with king John of England and emperor Otho of Germany, who were leagued against him, in which he was mostly successful. During the rest of his reign, Philippe was occupied in consolidating his new possessions, and took no part either in the war with the Albigenses or that in England, though his son Louis (Louis VIII. See Capetian Dynasty) went to the latter with an army. Philippe succeeded in establishing the unity of his dominions, and in emancipating the royal authority from the trammels of the papacy and clergy, and vindicated his sovereign authority over the latter as his subjects, irrespective of the pope. His measures, without alienating the great feudal lords, tended firmly to establish his authority over them, and to emancipate the larger towns from their sway. To increase the unity of the kingdom, and strengthen the central power, he established at Paris a chamber of 12 peers, 6 lay and 6 ecclesiastical, who almost always supported his plans, even against the court of Rome. Finally, he largely improved and embellished Paris, built many churches and other institutions, and encouraged commercial associations ; he also fortified many of the chief towns, including the capital. He died at Mantes, July 14, 1223.

PHILIPPE IV., surnamed *Le Bel* or "Fair," King of France, the son of Philippe III., king of France, and Isabella of Aragon, was b. at Fontainebleau in 1268, and succeeded his father in 1285. By his marriage with queen Joanna of Navarre, he obtained Navarre, Champagne, and Brie. For several years he carried on a struggle with the count of Flanders to obtain possession of that country, and also seized Guienne from the English; but was, in the end, obliged to restore Guienne and Flanders beyond the Lys. The great events of Philippe's reign were his war with the papacy and the extermination of the knights templars; the former had its origin in the attempts of the king to tax the clergy as well as the laity for the heavy expenses of his numerous wars. Boniface forbade the clergy to submit to taxation, while Philippe, on his side, ordered that neither money nor valuables were to be exported, thus cutting off a main supply of papal revenue; and on the pope's legate insolently reprimanding him, he threw him into prison. Philippe now called an assembly of states, in which deputies of towns appeared—though not for the first time—and obtained assurance of their support, even in case of excommunication and interdict. Boniface, in turn, assembled a council at Rome (1302), which supported his view, and the celebrated bull, *Unam Sanctam*, was issued. Philippe caused the bull to be publicly burned, and with the consent of the states-general confiscated the property of those prelates who had sided with the pope. Boniface now excom-

municated him, but the king, nothing daunted, sent to Rome his general, William de Nogaret, who seized and imprisoned the pope; and though he was released after a few days by a popular rising, he soon afterwards died. In 1304 Philippe obtained the elevation of one of his own creatures to the papal chair as Clement V., on condition of his residing at Avignon, and giving up the knights templars (q.v.). In accordance with this agreement, the templars were seized (1306–14), and burned by hundreds, and their wealth appropriated by Philippe. The grandmaster, Jacques Molay, was burned Mar. 18, 1314, and when dying he summoned Philippe to compear within a year and a day, and the pope within 40 days, before the judgment-seat of God; strange to say, both the pope and king died within the time mentioned, the latter at Fontainebleau, Nov. 29, 1314. Philippe during his whole reign steadily strove for the suppression of feudalism and the introduction of the Roman law; but while thus increasing the power of the crown, and also that of the third estate, he converted royalty, which was formerly protecting, kind, and popular to the mass of the people, into a hard, avaricious, and pitiless task-master. Under him the taxes were greatly increased, the Jews persecuted, and their property confiscated; and when these means were insufficient to satisfy Philippe's avarice, he caused the coinage to be greatly debased; yet he was an able monarch, and under him France was extended almost to its present limits on the n. and east.

PHILIPPE VI., OF VALOIS, King of France, was the son of Charles of Valois, younger brother of Philippe IV., and succeeded to the regency of France on the death of Charles IV., the proclamation of a king being deferred on account of the pregnancy of Charles IV.'s widow; but on her giving birth to a daughter, Philippe caused himself to be crowned king at Reims, May 29, 1328, and assumed royal authority. His right to the throne was denied by Edward III. of England, the grandson of Philippe IV., who declared that females, though excluded by the Salic law, could transmit their rights to their children, and therefore insisted upon the superiority of his own claims. Philippe, however, was not only already crowned king, but he had the support of the people. His reign commenced gloriously, for marching into Flanders to support the count against his rebellious subjects, he wiped out the disgrace of Courtrai by vanquishing the Flemings at Cassel, Aug. 23, 1328. He was obliged to give up Navarre (q.v.), as the Salic law of succession did not apply to it, but he retained Champagne and Brie, paying for them a considerable annual stipend. Philippe seems to have had no settled plan of government, and no systematic political action; his acts were regulated by the whim of the hour, and were mostly calculated to gratify his own vanity and love of show. From 1330 to 1336 constant encroachments had been made upon the English possessions in France, till at last Edward III.'s patience was exhausted; and, on Aug. 21, 1337, he formally declared war, and a commencement of this terrible hundred years' contest was made both in Guienne and Flanders; it was carried on languidly for several years, the only prominent incident being the destruction of the French fleet off Sluys, June 24, 1340. In Mar., 1343, Philippe established the "gabelle," or monopoly of salt, a heavy percentage tax on all mercantile transactions. The constant round of fêtes and tournaments at court was never interrupted, even when the war had well nigh exhausted the wealth of the country, for the money to carry them on was immediately provided by some new tax or fresh confiscation. In 1346 Edward III. landed in Normandy, ravaged the whole country to the environs of Paris, and totally defeated Philippe at Crécy (q.v.). A truce was then concluded, but the devoted kingdom had no sooner been released from war, than destruction in another and more terrible form, that of the "black death" (q.v.), threatened it. The wild extravagance of the court was nothing lessened by this visitation; but the financial embarrassments in which Philippe found himself compelled him to agree to the passing of a law (1338) which gave to the assembly of the states the sole power of imposing taxes. He received Dauphiné in gift in 1340, purchased Majorca from its unfortunate king, and died Aug. 22, 1350, neither loved nor respected. He was a despiser of learning and a bigot.

PHILIPPE LE BON, i.e., "the Good," Duke of Burgundy, the son of Jean "Sans-Peur" by Margaret of Bavaria, and grandson of Philippe the Bold, was born at Dijon, the capital of the duchy, June 13, 1396, and on the assassination of his father on the bridge of Montereau at the instigation of the dauphin, afterwards Charles VII., succeeded to the duchy of Burgundy. Bent on avenging the murder of his father, he entered into an offensive and defensive alliance with Henry V. of England at Arras in 1419, at the same time recognizing him as the rightful regent of France, and heir to the throne after Charles VI.'s death. This agreement, which disregarded the Salic law, was sanctioned by the king, parliament, university, and states-general of France by the treaty of Troyes, but the dauphin declined to resign his rights, and took to arms; he was, however, defeated at Crevant (1423) and Verneuil (1424), and driven beyond the Loire. Some disputes with the English prompted Philippe to conclude a treaty with the king of France in 1429. However, the English, by ceding to Philippe the province of Champagne, and paying him a large sum of money, restored him to their side. At this time, by becoming heir to Brabant, Holland, Zealand, and the rest of the Low Countries, he was at the head of the most flourishing and powerful realm in western Europe; but, though much more powerful than his superior, the king of France, he preferred to continue in nominal subjection. Smarting under some fresh insults of the English viceroy, and being strongly

urged by the pope, he made a final peace (1435) with Charles, who gladly accepted it, even on the hard conditions which Philippe prescribed, The English, in revenge, committed great havoc among the merchant navies of Flanders, which irritated Philippe to such an extent that he declared war against them, and, in conjunction with the king of France, gradually expelled them from their French possessions. The imposition of taxes, which were necessarily heavy, excited a rebellion, headed, as usual, by the citizens of Ghent, but the duke inflicted upon them a terrible defeat, July, 1454, though he wept over a victory bought with the blood of 20,000 of his subjects. The latter part of his reign was filled with trouble caused by the quarrels between Charles VII. and his son, the dauphin Louis, afterwards Louis XI., who had fled from his father's court, and sought shelter from Philippe, although, after ascending the throne, far from showing gratitude, he tried, in the most dishonorable manner, to injure his benefactor. Philippe died at Bruges, July 15, 1467, deeply lamented by his subjects. Under him Burgundy was the most wealthy, prosperous, and tranquil state in Europe; its ruler was the most feared and admired sovereign of his time, and his court far surpassed in brilliancy those of his contemporaries. Knights and nobles from all parts of Europe flocked to his jousts and tournaments.

PHILIPPE LE HARDI (*Philippe the Bold*), the founder of the second and last ducal house of Burgundy, was the third son of Jean, king of France, and his wife, Bonne of Luxemburg, and was born Jan. 15, 1342. He was present at the battle of Poitiers, 1356, and displayed such heroic courage, venturing his own life to save that of his father, as gained for him the sobriquet of *le hardi*, or "the Bold." He shared his father's captivity in England, and, on returning to France in 1360, received in reward of his bravery the duchy of Touraine, and subsequently (1363) also that of Burgundy, being created at the same time the first peer of France. On the accession of his brother, Charles V., to the throne of France, Philippe had to resign Touraine, but, as a compensation, obtained in marriage Margaret, the heiress of Flanders. In 1372 he commanded the French army opposed to the English, and took from them many of their possessions. In 1380 he exerted himself to suppress the sedition of the Flemish towns against their count, and succeeded with some of the malcontents; but the citizens of some of the populous places, especially Ghent, were possessed with such a fever of independence, that after many fruitless attempts to induce them to return to their allegiance, Philippe raised an army, and inflicted upon them the bloody defeat of Rosbeck, Nov. 27, 1382, leaving 26,000 of them on the field. Flanders, the county of Burgundy, Artois, Rethel, and Nevers fell to him by the death of the count in 1384, and the influence of his power, combined with prudence and good management on his part, soon won the affection and esteem of his new subjects. Energy and wisdom characterized his government; arts, manufactures, and commerce were much and judiciously encouraged, and his territory (a kingdom in extent) was one of the best governed in Europe. During the minority and subsequent imbecility of his nephew, Charles VI. of France, he was obliged to take the helm of affairs, and preserve the state from insurrection and sedition within, and the attacks of the English without. He was on his way to repel an attack of the latter on Flanders when he died at the chateau of Hal in Brabant, a little to the s.w. of Brussels, Apr. 27, 1404.

PHILIPPEVILLE, the ancient Russicada, seaport of Algeria, in the province of Constantine, and 38 m. n.n.e. of the city of that name, on the gulf of Stora, between cape Boujaroun and cape de Fer. It was laid out in 1838 by marshal Valée, on the ruins of the ancient Russicada, and is one of the prettiest towns in Algeria, and thoroughly French in its character. It is an important entrepôt of the commerce of the e. of Algeria and Sahara, and the country in the vicinity is picturesque and fertile, producing grain, tobacco, cotton and fruits. It contains numerous public offices, a large hospital and dispensary, Catholic and Protestant churches, public library and museum, theater, etc. In the vicinity at Filfila are quarries of marble and iron mines. The port, protected by two breakwaters, has an area of 125 acres and is divided into an outer and an inner harbor. There are here a grain distillery, tanneries, and cork manufactures. Philippeville is the chief station of the railway for the province of Constantine, and is connected by steamer with Marseilles and Algiers. Pop. '91, 21,962.

PHILIP'PI, a city of Macedonia. It was named after Philip II. of Macedon, who conquered it from Thrace, up to which time it had been called Crenides, or the "place of fountains," and enlarged it because of the gold mines in its neighborhood. Philip worked the mines so well that he got from them 1000 talents a year. It is famous on account of the two battles fought in 42 B.C. between Antony and Octavianus on the one side, and the republicans under Brutus and Cassius on the other. The first engagement was undecided; in the second, twenty days after, the republic finally perished. The apostle Paul founded a Christian church here in 53 A.D., to which one of his epistles is addressed. The ruins of the city still bear the name of Philippi, or Felíba.

PHILIP'PIANS, EPISTLE TO THE, one of the latest of the Pauline epistles. It was transmitted from Rome probably about the year 63 A.D., through Epaphroditus, apparently a pastor of the Philippian church, who had been sent to minister to the necessities of the apostle. The Philippian church was looked upon with peculiar tenderness and affection by Paul. It was the first fruits of his evangelization in Europe; its members were singularly kind towards him; again and again, when he was laboring in other

cities, such as Thessalonica and Corinth, they sent him contributions that he might not be burdensome to his new converts, and now they had sent one of the brethren all the way to Rome with presents for him, knowing that he was in bonds, and suspecting—what was in fact the case—that he might be in sore straits for his daily bread. His letter to them is deeply affecting. It contains not so much of doctrinal matter as of a warm outpouring of his personal feelings towards his friends at Philippi. The historical evidence in favor of the authenticity of the epistle is so strong that it could hardly give way to any internal criticism; and the objections of this kind, urged by Bauer, Schwegler, and others of the Tübingen school, who regard it as a Gnostic composition of the 2d c., are regarded as preposterous, even by many Biblical scholars who do not profess to be orthodox.

The epistle to the Philippians was referred to by Polycarp (107 A.D.), in his letter to the church at Philippi, as the well-known work of Paul the apostle; acknowl- his letter to the church at Philippi, as the well-known work of Paul the apostle; acknowledged by the heretical Marcion, 140, in common with orthodox Christians; quoted by Irenæus, Clement of Alexandria, Tertullian, and in the epistle of the churches of Lyons and Vienna, 177; contained in the Peshito (Syriac) version; and included in the canonical lists of the Muratorian Fragment, Eusebius, the council of Laodicea, and the synod of Hippo. It is only in recent times that its genuineness, notwithstanding this abundant and unanimous testimony, has been assailed by criticism and vague conjecture. The general consent of early tradition, and the internal evidence of the epistle itself, show that it was written at Rome, near the end of Paul's first imprisonment there; so that as a strain of triumph in his bonds at Rome, it is like his hymn of praise in the stocks at Philippi. The epistle may be divided into three parts. The first part contains the salutation, expressing the apostle's ardent and grateful attachment to the Philippian Christians; his assurance that his sufferings at Rome had resulted in great advantage to the gospel, and joy to himself, seeing that whether he lived to preach Christ, or died while prosecuting the work, Christ would be honored and his own salvation secured; also, his affectionate exhortations to the Philippians to honor their profession by a holy life; to be united, zealous, courageous, consecrated, conformed to Christ's humility, diligent in working out their own salvation through the help of God, and consistent in their conduct as the children of God, and the lights of the world, with his commendation of Timothy, whom he hoped to send soon to them, and of Epaphroditus whom he was about to send. The second part contains an earnest warning against Judaizing teachers, whom the apostle condemned because of their evil character, bad influence, and vain reliance on Jewish privileges which had become worthless, and which he, although as a native Jew he had possessed them all, utterly renounced; as, indeed, he renounced for Christ all things that could be accounted gain. Pressing on to attain these for himself, he exhorted the Philippians against worldliness and sensuality; adducing as the highest motive that their citizenship was in heaven from which Christ would come again. The third part contains special entreaties to individuals at Philippi; general exhortations to perpetual joy in the Lord, grateful and confiding prayer—with the promise of peace from God which would be like a strong fortress for their souls—and the enthusiastic pursuit of all good things; with grateful acknowledgment of the kindness which the Philippians had shown him, from his first preaching the gospel among them to their last overflowing bounty sent by their special messenger.

PHILIP'PICS, originally the three orations of Demosthenes against Philip of Macedon. The name was afterwards applied to Cicero's orations against the ambitious and dangerous designs of Mark Antony. It is now commonly employed to designate any severe and violent invective, whether oral or written.

PHILIP'PINE ISLANDS lie to the n. of Borneo and Celebes, between 5° and 26° n. lat., and 117° 16′ to 126° 53′ e. long. They are more than 1200 in number, with an area of 114,326 sq. miles. Pop. 7,000,000, three-fourths of whom are subject to Spain, the remainder governed, according to their own laws and customs, by independent native princes.

Luzon, in the n. has an area of 40,024 sq. m., and next is Mindanao, or Magindanao, in the s. The islands lying between Luzon and Mindanao are called the Visayas, the largest of which are—Samar, Mindoro, Panay, Leyte, Negros, Masbate, and Zebu. There are upwards of a thousand lesser islands, of which little is known. To the s.w. of the Visayas lies the long, narrow island of Palawan, formed of a mountain-chain with low coast-lines, cut with numerous streams, and exceedingly fertile. The forests abound in ebony, log-wood, gum-trees, and bamboos. To the n. of Luzon lie the Batanen, Bashee, and Babuyan islands, the two first groups being inhabited, the last unpeopled.

The Sooloo islands form a long chain from Mindanao to Borneo, having the same mountainous and volcanic structure as the Philippine islands, and all are probably fragments of a submerged continent. Many active volcanoes are scattered through the islands, Mayon, in Luzon, and Buhayan, in Mindanao, often causing great devastation. The mountain-chains run n. and s., and never attain a greater elevation than 7,000 feet. The islands have many rivers, the coasts are indented with deep bays, and there are many lakes in the interior. Earthquakes are frequent and destructive, Manila, the capital, having been nearly destroyed by one in 1863. On Feb. 3, 1864, another terrific earthquake visited the province of Zamboango, in Mindanao, leveling all the houses to the ground, and causing some of the smaller islands to disappear. Earthquakes

occurred also in 1880 and 1881. The soil is extremely fertile, except where extensive marshes occur. In Mindanao are numerous lakes, which expand during the rainy seasons into inland seas. Rain may be expected from May to December, and from June to November the land is flooded. Violent hurricanes are experienced in the n. of Luzon and w. coast of Mindanao. Especially during the changes of the monsoons, storms of wind, rain, thunder and lightning prevail. The weather is very fine, and heat moderate, from December to May, when the temperature rapidly rises and becomes oppressive, except for a short time after a fall of rain. The fertility of the soil and the humid atmosphere produce a richness of vegetation which is nowhere surpassed. Blossoms and fruit hang together on the trees, and the cultivated fields yield a constant succession of crops.

Immense forests spread over the Philippine islands, clothing the mountains to their summits; ebony, iron-wood, cedar, sapan-wood, gum-trees, etc., being laced together and garlanded by the bush-rope or palasan, which attains a length of several hundred feet. The variety of fruit-trees is great, including the orange, citron, bread fruit, mango, cocoa-nut, guava, tamarind, rose-apple, etc.; other important products of the vegetable kingdom being the banana, plantain, pine-apple, sugar-cane, cotton, tobacco, indigo, coffee, cocoa, cinnamon, vanilla, cassia, the areca-nut, ginger, pepper, etc., with rice, wheat, maize, and various other cereals.

Gold is found in river-beds and detrital deposits, being used, in form of dust, as the medium of exchange in Mindanao. Iron is plentiful, and fine coal-beds, from one to four feet thick, have been found. Copper has long been worked in Luzon. There are also limestone, a fine variegated marble, sulphur in unlimited quanity, quicksilver, vermilion, and saltpeter—the sulphur being found both native and in combination with copper, arsenic, and iron.

Except the wild cat, beasts of prey are unknown. There are oxen, buffaloes, sheep, goats, swine, harts, squirrels, and a great variety of monkeys. The jungles swarm with lizards, snakes, and other reptilia; the rivers and lakes with crocodiles. Huge spiders, tarantulas, white ants, mosquitoes, and locusts are plagues which form a set-off to the beautiful fire-flies, the brilliant queen-beetle (*elater noctilucus*), the melody of myriads of birds, the turtle-doves, pheasants, birds of paradise, and many species of paroquets.

The caverns along the shores are frequented by the swallow, whose edible nest is esteemed by the Chinese a rich delicacy. Some of them are also tenanted by multitudes of bats of immense size. Buffaloes are used for tillage and draught; a small horse for riding. Fowls are plentiful, and incredible numbers of ducks are artificially hatched. Fish is in great abundance and variety. Mother-of-pearl, coral, amber, and tortoise-shell are important articles of commerce.

The Tagals and Visayers are the most numerous native races. They dwell in the cities and cultivated lowlands; being largely converts to Roman Catholicism, and a considerable number, especially of the Visayers, Mohammedan. The mountain districts are inhabited by a negro race, who, in features, stature, and savage mode of living closely resemble the Alfoers of the interior of Papua, and are probably the aborigines driven back before the inroads of the Malays. A few of the negroes are Christian, but they are chiefly idolaters, or without any manifest form of religion, and roaming about in families, without fixed dwelling. The mestizos form an influential part of the population; by their activity engrossing the greatest share of the trade. These are mostly of Chinese fathers and native mothers. Few Spaniards reside in the Philippine islands, and the leading mercantile houses are English and American, between whom and the natives the Chinese are the chief middlemen. The principal languages are the Tagalese and Visayan. Rice, sweet potatoes, fish, flesh, and fruits form the food of the Tagals and Visayers, who usually drink only water, though sometimes indulging in coca-wine. Tobacco is used by all. They are gentle, hospitable, fond of dancing and cock-fighting.

The government is carried on by a governor-general and a captain-general, and the 43 provinces are administered by alcaldes, or commandants. Education is far behind, and similar to what it was in Europe during the middle ages. There is an archbishop of Manila, and bishops of New Segovia, Nueva Caceres, and Zebu. Religious processions are the pride of the people, and are formed with great parade, thousands of persons carrying wax-candles, etc. The natives not only build canoes, but ships of considerable tonnage. They weave various textile fabrics of silk, cotton, abaca, and very fine shawls and handkerchiefs from the fiber of pineapple leaves.

The revenue of the Philippine islands in 1894–95 was estimated at £2,715,980, and the expenditure £2,656,026. There is an export duty on tobacco and almost all imports are heavily taxed—as high as 100 % *ad valorem* on petroleum and cotton cloth.

It is to be remembered that all the ports of this archipelago, except Sual, Iloilo Zebu, and Manila, are still closed against foreign vessels. In 1868 there seemed a gleam of hope that a more liberal commercial policy would be adopted by Spain for their possessions among the Philippine islands. In that year it was decreed that differential duties should be abolished in April, 1871. They were abolished accordingly, but only for three months. In July, an order was issued granting importers, under the Spanish flag, of foreign goods, an advantage of 2.5 per cent. The value of the produce exported, 1895, to Great Britain was £1,606,271. The chief exports are hemp and sugar. The imports from Great Britain, '95, were valued at £4,151,803, on which large duties were placed. Other exports are copra, tobacco, cigars, indigo, Manila hemp of Abaca (q. v.), coffee, dye-woods, hides, gold-dust, and beeswax. Cotton, woolen, and silk goods, agricultural implements, watches, jewelry, etc., are imported. In 1895, 304 vessels of

425,025 tons were cleared from Manila, Zebu, and Iloilo. British merchants do the largest business.

The Philippine islands were discovered in 1521 by Magellan, who, after visiting Mindanao, sailed to Zebu, where, taking part with the king in a war, he was wounded, and died at Mactan, April 26, 1521. Some years later the Spanish court sent an expedition under Villabos, who named the islands in honor of the prince of Asturias, afterwards Philip II. For some time the chief Spanish settlement was on Zebu; but in 1581 Manila was built, and has since continued to be the seat of government.

On August 1st, 1896, a formidable conspiracy of the Malays and mestizos came to light, news of it having been obtained, it is said, through the confession of the wife of one of the principal conspirators. It had for its object the complete independence of the islands from Spain, and is said to have received support from the Chinese, Japanese, and some of the foreign merchants residing on the islands. The alleged grievances of the natives were the heavy taxation, the enforced duty of giving, each year, forty days' labor to the government, the income tax, and the extortions of corrupt officials. Other accounts represent the trouble as having arisen from the oppression of the priests. The government at once took measures to suppress the conspiracy. Hundreds were arrested on suspicion, including persons connected with Philippine affairs in Madrid. It had been planned to make a sudden attack upon the citadel at Manila, to murder the governor, Marshal Blanco, and massacre the garrison of the Spanish posts, and the officials and priests. The government's prompt action in arresting the conspirators and its attempt to terrorize the insurgents by the execution of numerous captives failed to prevent the revolt. It broke out on August 20, 1896, in Manila and several other towns, but at first was unsuccessful. The rebels were repulsed from Manila on August 30th, and a considerable body of them was driven into the mountains. They gathered recruits rapidly, however, and captured the naval station of Cavite, eight miles from Manila. The war was marked by the most atrocious cruelties on the part of both the natives and the Spaniards. Tortures of every kind were inflicted and scores of prisoners in the hands of the Spaniards were suffocated by being confined in the unventilated dungeon of San Sebastian. On October 17th, the rebels were defeated with considerable loss at the town of Nasugdu, but early in the following month the Spanish troops were repulsed in an attack on Novaleta. This was offset soon afterwards by the Spanish victory at Santa Cruz de Laguna, where 4,000 rebels were defeated with considerable loss. Marshal Blanco's success, however, was but slight and he was soon afterwards recalled by the Spanish government, which sent out Gen. Polivieja to take his place. It was the latter's plan to surround the main force of the insurgents in Cavite, and his campaign was vigorously begun. A native force was attacked and driven back on the border of Bulacan and another victory was gained by the Spaniards at Santa Maria at the close of 1896. These defeats had the effect of discouraging the natives, who now surrendered in large numbers in accordance with the offer of amnesty made by Gen. Polivieja, to all those who would lay down their arms within a specified time. In the spring of 1897 the Spaniards gained further advantages but did not succeed in suppressing the revolt. In May it was estimated that there were 25,000 of the rebels under arms, and, in June, 1897, the revolt was still by no means subdued.

See Foreman, *The Philippine Islands* (1896); the diplomatic and Consular Reports from Spain and her colonies for 1896; and *Deutsches Handels Archiv* (1896).

PHIL'IPPINS, a Russian sect, so called from the founder, Philip Pustoswiät, under whose leadership they emigrated from Russia in the end of the 17th c., are a branch of the Raskolniks (q.v.). They call themselves Starowerski, or "Old Faith Men," because they cling with the utmost tenacity to the old service-books, the old version of the Bible, and the old hymn and prayer-books of the Russo-Greek church, in the exact form in which these books stood before the revision which they underwent at the hands of the patriarch Nikon, in the middle of the 17th century. There are two classes of the Raskolniks—one which recognizes popes (or priests); the other, which admits no priest or other clerical functionary. The Philippins are of the latter class; and they not only themselves refuse all priestly ministrations, but they regard all such ministrations—baptism, marriage, sacraments—as invalid; and they re-baptize all who join their sect from other Russian communities. All their ministerial offices are discharged by the Starik, or parish elder, who for the time takes the title of pope, and is required to observe celibacy. Among the Philippins the spirit of fanaticism at times has run to the wildest excesses. They refuse oaths, and decline to enter military service; and having, on account of this, and many other incompatibilities of the system with the Russian practice, encountered much persecution, they resolved to emigrate. Accordingly, in 1700, under the leadership of Philip Pustoswiät, they settled partly in Polish Lithuania, partly afterwards in east Prussia, where they still have several small settlements with churches of their own rite. They are reported to be a peaceable and orderly race. Their principal pursuit is agriculture; and their thrifty and industrious habits have secured for them the good-will of the proprietors.

PHILIPPOP'OLIS, capital of Roumelia, Turkey, 112 m. w.n.w. from Adrianople. It stands on a small island formed by the Maritza, which here becomes navigable. This island rises as a hill in the midst of a vast plain, which extends beyond Adrianople on the e., and from the base of the Rhodope mountains on the s., to the Balkan chain on the north. The plain is extremely fertile, and cereals, tobacco, wine, etc. are produced.

Philippopolis carries on a very extensive commerce both with Austria and with the East. Philippopolis is an ancient town, and in the time of the Romans bore the name of *Trimontium*. Philippopolis is the seat of a Greek archbishop. The North American board of missions has a station at Philippopolis. Pop. 1888, 33,600 of whom 19,500 are Bulgarians, 5,600 Mohammedans, and 3,900 Greeks.

PHILIPPOTEAUX, Félix Emanuel Henri, b. Paris, 1815; student with the painter, Cogniet, whose battle pieces became the models for the pupil's prolific after work. One of his first notable paintings was the "Rock of Ice," which appeared in 1833, and represented a scene in the American war of the revolution. One of his others is the bombardment of Paris by the Germans in 1871, painted in 1872. His works are mostly on a grand scale, with many figures, and enliven the walls of palaces and public galleries in France. His panorama, "The Siege of Paris," was exhibited in N. Y. city. He d. 1884.

PHILIPPSBURG, an urban commune of Baden, 17 m. n. from Karlsruhe, on the right bank of the Rhine, at the mouth of the Salzbach. In former times it was one of the most important fortresses on the Rhine, and belonged to the bishop of Spires. During the Thirty Years' war, Philippsburg fell successively into the hands of the Swedes, the French, the Imperialists, and again of the French, who were confirmed in possession of it by the peace of Westphalia. In the war between Louis XIV. and Germany, it was taken by the Germans under duke Charles of Lorraine, and assigned to Germany by the peace of Nimeguen in 1679, but was again taken in 1688 by the French under Vauban, and once more restored to Germany by the peace of Ryswick in 1697. The French captured it again in 1734, and this time with little difficulty, the strength of the fortress being now much diminished, although the capture cost the life of the duke of Berwick, their commander; and they again relinquished it in 1735. During the wars of the French revolution, Philippsburg was bombarded in 1799, taken, and its fortifications completely destroyed in 1800. Pop. '95, 2469.

PHILIPS, Ambrose, was b. in Leicestershire about 1671. He studied at St. John's college, Cambridge, and took his degree of M.A. in 1700. In 1709 his pastorals appeared, along with those of Pope, in *Tonson's Miscellany;* and the same year, having gone on a diplomatic mission to Copenhagen, he addressed from thence a "poetical letter" to the earl of Dorset, which was published, with a warm eulogium from Steele, in the *Tatler*. In 1712, he brought on the stage *The Distressed Mother*, a tragedy adapted from Racine's *Andromaque*, which had great success. He subsequently wrote two other tragedies, but they proved failures. Some translations from Sappho, which appeared in the *Spectator*, added greatly to Philips's reputation, but Addison is believed to have assisted in these classic fragments. Some exaggerated praise of Philips having appeared in the *Guardian*, Pope ridiculed his pastorals in a piece of exquisite irony, which led to a bitter feud between the poets. Philips even threatened personal chastisement, and hung up a rod in Button's coffee-house, but no encounter took place. One of the names fastened upon Philips was that of "Namby Pamby," arising from a peculiar style of verse adopted by him in complimentary effusions consisting of short lines and a sort of infantine simplicity of diction, yet not destitute of grace or melody. The accession of the house of Hanover proved favorable to the poet; he was appointed pay-master, and afterwards a commissioner of the lottery; and going to Ireland as secretary to archbishop Boulter, he became secretary to the lord chancellor, M.P. for Armagh, and registrar of the prerogative court. He died in 1749. Philips is somewhat conspicuous in literary history from the friendship of Addison and the enmity of Pope; but his poetry, wanting energy and passion, has fallen out of view.

PHILIPS, or **PHILLIPS**, John, 1676–1708; b. Bampton, England; educated at Winchester school and at Christ-church, Oxford. He published in 1703 *The Splendid Shilling*, written while in college; 1705, *Blenheim*, in honor of Marlborough's victory; 1706, *Cyder*, in two books, in the manner of the *Georgics*, of Virgil.

PHILIPSTOWN, a market and post town (formerly the assize town) of King's co., province of Leinster, Ireland, 47 m. s.w. from Dublin. Its charter dates from 1567; and in the reign of James II. it obtained the privilege of sending two members to parliament. This privilege was withdrawn at the Union. It is at present, and has long been, a place of hardly any trade and entirely without manufacture. It contains an old castle where once resided King Philip of Spain, whence the name of the town. It is now used for barracks. Pop. less than 1000.

PHILISTINES (*LXX.*, *allophuloi*, strangers), a word either derived from a root *phalasa* (Æth.), to emigrate, wander about, or identified with Pelasgians (q.v.), or compared by others with *shefela* (Heb.), lowlanders; designates a certain population mentioned in the Bible as being in frequent contact with the Jews, and who lived on the coast of the Mediterranean, to the s.w. of Judæa, from Ekron toward the Egyptian frontier, bordering principally on the tribes of Dan, Simeon, and Judah. Our information about the origin of the Philistines is extremely obscure and contradictory. The genealogical table in Genesis x. 14 counts them among the Egyptian colonies (the "Calushim, out of whom came Philistim"); according to Amos ix. 7, Jeremiah xlvii. 4, and Deuteronomy ii. 23, they came from Caphtor. But supposing that the Casluhim were some separate tribe, and yet Caphtorian colonists, the question still remains, whether

Caphtor can be identified with Cappadocia in Asia Minor, as the early versions (*LXX.*, *Targ.*, *Pesh.*, *Vulg.*) have it; or whether it be Pelusium, Cyprus, or the isle of Crete. The latter opinion seems not the least probable among them. At what time they first immigrated, and drove out the Canaanitish inhabitants, the Avvim, is difficult to conjecture. They would appear to have been in the country as early as the time of Abraham; and in the history of Isaac, Abimelech, king of Gerar, is distinctly called king of the Philistines. Yet, even supposing that in Genesis the country is designated by the name which it bore at a later period, there can yet be no doubt of the people being firmly established at the time of Moses (Exodus xv., 14, etc.). Thus the date of their immigration would have to be placed at about 1800 B.C. At the Exodus Moses, evidently fearing an encounter with the warlike colony for his undisciplined band, did not choose the shorter way to Canaan through their territory, but preferred the well-known circuitous route. At a later period, however, Joshua, having triumphed over 31 Canaanite princes, also conceived the plan of making himself master of the possessions of the Philistines; but his intended disposal of their country for the benefit of the tribe of Judah was never carried out. At this time, they were subject to five princes (Seranim = axles, pivots), who ruled over the provinces of Gaza, Ashdod, Askalon, Gath, and Ekron. Not before the period of the Judges did they come into open collision with the Israelites; and the strength and importance in which they suddenly appear then, contrast so strangely with their insignificance at the time of the patriarchs, that many theories—a double immigration principally—have been propounded to explain the circumstance. We find them daring powerful nations like the Sidonians, whom, about 1209 B.C., they forced to transfer their capital to a more secure position on the island of Tyre; or the Egyptians, with whom they engaged in naval warfare at the same time, under Ramesas III. With the Israelites their war assumed the air of guerrilla raids, sometimes into the very heart of the country. Under Shamgar (about 1370 B.C.), they were repulsed, with a loss of 600 men; however, about 200 years later, the Israelites were tributary to them, and continued to groan under their yoke, with occasional pauses only, until Samson first commenced humiliating them. But they were still so powerful at the time of Eli, that they carried away the ark itself. Under Samuel, their rule was terminated by the battle of Mizpah. Saul was constantly engaged in warding off their new encroachments, and at Gilboa, he and his sons fell in a disastrous battle against them. At this time, they seem to have returned to their primitive form of a monarchy, limited, however, by a powerful aristocracy, the king's formal title again being "Abimelech" = "father-king," as we find it in Genesis. David succeeded in routing them repeatedly; and under Solomon their whole country seems to have been incorporated in the Jewish empire. The internal troubles of Judæa emboldened the Philistines once more to open resistance. Under Joram, in union with the Arabians, they invaded Judæa, and not only carried away the royal property, but also the serail and the royal children. Uzziah, however, recovered the lost ground; he overthrew them, and dismantled some of their most powerful fortresses—Gath, Yabne, and Ashdod, and erected forts in different parts of their country. Under Ahaz, they rose again, and attacked the border-cities of the "plain" on the s. of Judah; and a few years later, renewed their attacks, in league with the Syrians and Assyrians. Hezekiah, in the first years of his reign, subjected their whole country again, by the aid of the Egyptians, whom we find in the possession of five cities. The Assyrians, however, took Ashdod, under Tartan, which was retaken again by Psammetich, after 29 years' siege. About this time, Philistæa was traversed by a Scythian horde on their way to Egypt, who pillaged the temple of Venus at Askalon. In the terrible struggles for supremacy which raged between the Chaldæans and Egyptians, Philistea was the constant battle-ground of both—her fortresses being taken and retaken by each of them in turn; so that the country soon sank into ruin and insignificance. Yet a shadow of independence seems to have been left it, to judge from the threats which Zechariah (ix. 5), after the exile, utters against Gaza and Askalon, and their pride. In the time of the Maccabees, the Philistines were Syrian subjects, and had to suffer occasionally from the Jews, although intermarriages between the two nations were of no rare occurrence. Alexander Balas transferred part of the country to Judæa; another part was taken by Alexander Jannæus; Pompey incorporated some of the cities with Roman Syria; Augustus transferred another portion to Herod; and finally, Salome, his sister, received a small principality of it, consisting of Jamnia, Ashdod, and Askalon. But by this time the name of the country had long been lost in that of Palestine, which designated all the territory between Lebanon and Egypt.

Of their state of culture, institutions, etc., we know very little indeed. They appear as a civilized, agricultural, commercial, and warlike nation. They traded largely, and their wares seem to have been much sought after. Their worship was much akin to that of the Phenicians—a nature-religion, of which Dagon, Ashtaroth, Beelzebub, and Derceto were the chief deities. Priests and soothsayers abounded; their oracles were consulted even by people from afar. They carried their charms about their persons, and their deities had to accompany them to the wars. They do not seem to have practiced circumcision. As to their language, so little is known about it, that conjectures seem more than usually vain. Those who take them to have been Semites, conclude that their language, too, was Semitic; others, who would identify them with the Pelasgians, differ also respecting their language. Thus much is certain, that their proper

names, as they are recorded in the Bible, are mostly Semitic, and that there always remained a difference of dialect between the Hebrew and the Philistean idiom.

PHILISTINISM is a cant term introduced into England by Carlyle, whose use has since been widely extended by Matthew Arnold. The allusion is to the ancient Philistines, the enemies of the children of light; hence Philistinism, in its modern application, means stolid opposition to the higher intelligence of the age, inaccessibility to ideas; plain, humdrum, respectable conventionalism. The German students first applied the term *Philister* to a townsman or to one who had not been trained in a univ.; it soon found a foothold in German literature, and was first imported into England in Carlyle's essay on Goethe. The term has now grown so hackneyed that the finer sort of people hesitate to use it, and its indiscriminate use has almost emptied it of meaning. Perhaps Leslie Stephen's definition of Philistinism, as "a term of contempt applied by prigs to the rest of their species," is the only one that is sufficiently comprehensive.

PHILLIMORE, Sir Robert Joseph; b. London, 1810; educated at Westminster and Oxford. In 1831 he became a clerk of the board of control, and soon afterward was called to the bar, where he acquired a large practice, and was made a queen's counsel. In 1840 he was appointed official to the archdeaconries of Middlesex and London, and in 1844 chancellor of the duchy of Chichester. He was a member of parliament in the liberal-conservative interest, and made some notable speeches on church rates, and tithe commutations, and brought in the bill called "Dr. Phillimore's act," authorizing ecclesiastical courts to take *viva voce* testimony. He was made judge of the Cinque Ports in 1855, advocate general in admiralty, 1862, when he was knighted, and in 1867, judge of the high court of admiralty and of the arches court of Canterbury. He was judge advocate general, 1871–73, and made master of the faculties in the latter year. In 1875 he resigned his other offices, and was appointed judge of the admiralty and probate division of the high court of justice. As judge of the arches court, the chief ecclesiastical court, he rendered many important judgments, some of which have been republished. The most valuable of his numerous legal works is his *Commentaries upon International Law*, 4 vols., 1854–61. Among his other writings are *Memoirs and Correspondence of Lord Lyttleton*, 1845; *Clergy Discipline*, 1872; *The Ecclesiastical Law of the Church of England*, 1873; and a translation of Lessing's *Laocoön*. He d. in 1885.

PHILLIP, John, R.A., was b. May 22, 1817, at Aberdeen. At a very early age he gave indication of the talent which afterwards so distinguished him: and before he had attained his 15th year had painted various pictures showing his feeling for color. He thus procured an introduction to lord Panmure, by whom he was enabled to go to London to pursue his studies. He began by copying from the Elgin marbles at the British museum, and after a few months was admitted as a student at the royal academy.

All his early subjects were of Scotch character, such as a "Scotch Fair," "Baptism in Scotland," a "Scotch Washing," "The Offering," etc. In the year 1851 he went to Spain in search of health, which he found, and with it a change in the character of his subjects. On his return home he established himself at the head of the painters of the habits and customs of the Spanish people. In 1853 he exhibited at the royal academy "Life among the Gipsies at Seville." His pictures for 1854–55, "A Letter Writer of Seville," and "El Paseo," were both purchased by her majesty the queen. In 1857 he attained the rank of associate of the royal academy, and the following year exhibited a most powerful picture of "Spanish Contrabandistas," which was purchased by the late prince consort, of whom he also painted a portrait the same year for the town-hall of his native city. In 1859 he received the full honor of royal academician. His work for exhibition in 1860 was certainly the most difficult he had yet tried, and his success was proportionably great. "The Marriage of the Princess Royal" was pronounced by both his fellow-artists and the public as a decided success. His next portrait subject (exhibited 1863) was, if possible, a still more difficult task, being the "House of Commons, 1860," containing upwards of 30 portraits of the leading members of both sides of the house; in it he was equally successful. He died Feb. 27, 1867.

PHILLIP, Arthur, 1738–1814, an English navigator born in London, was the first colonial governor of Botany Bay, Australia. He was sent out in 1788, with 850 convicts, and a guard of about 200 officers and men.

PHILLIPS, a co. in e. Arkansas, bounded on the s.e. by the Mississippi, drained by the St. Francis river; on the Arkansas Midland and several other railroads; 650 sq. m.; pop. '90, 25,341 includ. colored. The surface is level, well wooded, swampy in parts, and exposed to inundation. The soil is fertile. The principal productions are corn, wheat, and cotton. Co. seat, Helena.

PHILLIPS, a co. in n. eastern Col. on the Nebraska border, formed from part of Logan; 570 sq m.; pop. '90, 2642. It is drained by Frenchman's creek. Co. seat, Holyoke.

PHILLIPS, a co. in n. Kansas, adjoining Nebraska, drained by Prairie Dog creek and the North Fork of Solomon river; about 900 sq.m.; pop. '90, 13,661, chiefly of American birth. The surface is rolling, with little timber. The soil is fertile, and well adapted to pasturage. Co. seat, Phillipsburg.

PHILLIPS, ADELAIDE, b. England, 1833; adopted the profession of the stage, and first appeared at the Boston museum, in 1843, as "Little Pickle." She played *soubrette* parts in that theater and at the Walnut Street Theatre in Philadelphia until 1852, when, having revealed her possession of a contralto voice of remarkable sweetness and compass, she was sent to Italy for study. She remained abroad two years, and made a successful *début* in Brescia, in 1853, in *Semiramide*. The following year she returned to the United States, and appeared in concert in the Music hall, Boston, making her American *début* in opera at the Academy of Music, New York, Mar. 17, 1856, in the part of "Azucena" in Verdi's *Il Trovatore*, in which she was entirely successful. In 1861 she appeared in this part in the Italian opera-house in Paris. She at once assumed the position of the leading contralto singer of America, which she held for many years. In 1869 she sang in the peace jubilee in Boston, and afterward traveled through the country, appearing in opera and concert. She d. 1882.

PHILLIPS, GEORG, 1804–72; b. Konigsberg; of English descent; studied law at Munich and Berlin; converted from Protestantism to the Roman Catholic faith. Associated with Görres, they established the *Historisch-Politische Blätter* in 1838, conducting it in the interest of the church of his adoption, its principles tending towards the re-establishment of the power of the Roman hierarchy, reducing the state to a mere administrative organ to execute the will of the church. In 1833 he was appointed professor of civil law at Munich, of canon law and legal history at Innspruck, 1849; of legal history, Vienna, 1851. Besides able works in defense of the church he published *Das Kirchenrecht*, 7 vols., 1845–69; *Lehrbuch des Kirchenrechts*, 2 vols., 1871, etc.

PHILLIPS, JOHN, LL.D., 1719–95; b. Boston; graduated at Harvard college, 1735; was licensed to preach, but afterwards engaged in mercantile pursuits at Exeter, N. H.; for several years was a member of the council of New Hampshire. In 1778, in connection with his brother, Samuel Phillips, he founded and endowed Phillips academy at Andover, Mass.; and a few years later established alone Phillips academy at Exeter, N. H., the endowment of which he ultimately increased to $134,000 by bequeathing to it two-thirds of his estate. He also endowed a professorship in Dartmouth college, contributed liberally to the college of New Jersey, and left one-third of his estate to Andover theological seminary in aid of students for the ministry.

PHILLIPS, JOHN, 1770–1823; b. Boston; graduated at Harvard, 1778; studied law and was made a judge of common pleas, 1809; state senator, 1803–23, and president of the senate, 1813–23; first mayor of Boston—which became a city in 1822—and father of the distinguished writer and lecturer, Wendell Phillips.

PHILLIPS, JOHN, 1800–74; b. Wiltshire, England; nephew of William Smith, often called the "father of English geology." From the age of 15 he accompanied his uncle in surveys and geological explorations in various parts of England. In 1827 he was made curator of the Yorkshire philosophical society, and delivered lectures on many scientific topics. He was a professor successively in Kings college, the university of Dublin, and of Oxford; and has published a treatise on geology and several special treatises.

PHILLIPS, SAMUEL, JR., LL.D., 1751–1802; b. Mass.; graduated at Harvard college, 1771; was a member of the provincial congress in 1775, and of the house of representatives until 1780, when, having assisted in forming the constitution of Massachusetts, he was elected to the senate, of which he was president, 1785–1802; was judge of the court of common pleas for Essex co., 1781–97; elected lieutenant-governor 1801. He was one of the projectors and a distinguished benefactor of the academies at Andover and Exeter, and one of the founders of the Boston academy of arts and sciences. At his death he left $5,000 to the cause of education, and afterward his widow carried out his wishes by joining in the endowment of Andover theological seminary.

PHILLIPS, STEPHEN CLARENDON, 1801–57, b. Boston; graduated at Harvard, and went into business. He served in both branches of the Massachusetts legislature, was a member of congress, 1834–38, and mayor of Salem, 1838–42. He was the free-soil candidate for governor in 1848 and 1849, and for several years a member of the state board of education.

PHILLIPS, WATTS, 1828–74; b. England; studied drawing under George Cruikshank, and at Paris. He was an artist of some reputation, but better known by his plays, of which the most successful was *The Dead Heart*. Among his other plays are *Joseph Chavigny; The Poor Strollers;* and *The Huguenot Captain*.

PHILLIPS, WENDELL, b. Boston, Nov. 29, 1811; son of Boston's first mayor. He graduated from Harvard in 1831, and from the Cambridge law-school in 1833; was admitted to the state bar, and practiced until 1839, when he retired from professional work on account of his unwillingness to be bound by an oath of fidelity to the U. S. constitution, as then construed by the supreme court. His first public appearance in the light of a reformer was in an impromptu speech of great eloquence at the Faneuil Hall meeting of Dec., 1837, held to denounce the murder in Alton, Ill., of the Rev. E. P. Lovejoy (q.v.). He was a warm supporter of Garrison and that party of abolitionists who believed the constitution to be void as upholding slavery against the "higher law." After the settlement of the slavery question by the war, Mr. Phillips was ever an eager advo-

cate of the woman's rights, temperance, and "labor-reform" movements, and in 1870 was the candidate of the labor-reform party for governor of Massachusetts. For many years Wendell Phillips was recognized as the first of public lecturers, and probably the best known of his lectures are those on *The Lost Arts* and on *Daniel O'Connell*. As an orator he stood unsurpassed in vigorous elegance and grace of delivery. He published many pamphlets on the questions in which he was so warmly interested, such as *The Constitution a Pro-slavery Contract* (1844); *Review of Webster's 7th-of-March Speech* (1850). A collection of his speeches, letters, and lectures was published in 1863 in Boston. Perhaps no speaker in the country elicited more admiration for finished and impressive address; while probably none elicited more adverse criticism for his views. The criticism, however, was aimed not at his moral principle, but at his intellectual method. He d. 1884.

PHILLIPS, WILLIAM, 1750–1827; b. Boston; having been prevented by poor health from acquiring a thorough education, entered early on mercantile life in connection with his father, from whom he inherited a large fortune. From 1794 until his death he was a deacon of the Old South church; was highly respected in the community, eminent both in church and in state, active in philanthropic labors; at one time lieutenant-governor of the state. His charitable contributions during many years averaged about $10,000 a year, and his legacies to various religious and benevolent institutions amounted to more than $60,000.

PHILLIPS, WILLIAM WIRT, D.D., 1796–1865; b. Montgomery co., N. Y.; graduated at Union college, 1812; studied theology four years in the seminaries at New York and New Brunswick; became pastor of the Pearl Street Presbyterian church, N. Y., 1818; and afterward for nearly 40 years of the First Presbyterian church, whose house of worship in Wall street was sold in 1844, after which a new edifice was erected on Fifth avenue and 12th street. He was moderator of the general assembly, 1835; for many years president of the board of foreign missions; a trustee of the College of New Jersey; a director of Princeton theological seminary, of the Sailors' Snug Harbor, and of other institutions.

PHILLIPS ACADEMY, Andover, Mass., endowed in 1778 by John Phillips, William Phillips, Samuel Phillips, and others, graduates of Harvard college. Its endowment is large, it has a library of 4000 volumes, and complete physical and chemical laboratories. Its principals have been men eminent for learning, and the roll of its alumni embraces many highly distinguished names. It has always stood in the highest rank of academies in this country. The education gained here by students in preparation for the great colleges is noted for thoroughness. In 1897 there were 20 teachers and 402 students. Principal, Cecil F. P. Bancroft, PH.D.

PHILLIPS EXETER ACADEMY, at Exeter, N. H., was founded in 1781 by John Phillips, LL.D., and is one of the most celebrated schools in this country for preparing boys for college. There is also an English course. It is well endowed. No. of students, abt. 300. Many men of distinction received their preparatory training here. Like the corresponding institution in Andover, Mass., it is not surpassed for thoroughness.

PHILO JUDÆ'US, *the Philosopher* (there being another Jewish Greek writer of this name), was born at Alexandria, about the time of the birth of Christ. Belonging to one of the most wealthy and aristocratic families—his brother was the Alabarch Alexander—he received the most liberal education; and, impelled by a rare zeal for learning, he, at a very early age, had passed the ordinary course of Greek studies which were deemed necessary for one of his station. Although every one of the different free sciences and arts included in the *Encyclika*, he says, attracted him like so many beautiful slaves, he yet aimed higher, to embrace the mistress of all—philosophy. Metaphysical investigation was the only thing which, according to his own confession, could give him anything like satisfaction or pleasure. The extraordinary brilliancy of his style, which, by his contemporaries, was likened to that of Plato—his rare power of thought and imagination, and an erudition which displayed the most astonishing familiarity with all the works of the classical Greek poets and philosophers, while at the same time it made him an adept in the fields of history, geography, mathematics, astronomy, physiology, natural history, music, etc.—could not but be of vast influence both upon his co-religionists and those beyond the pale of his ancestral creed. He had completely mastered the literature of his nation; but, strange to say, he chiefly knew it, as far as it was Hebrew, from translations. Thus, the Bible was only familiar to him through the Septuagint version, with all its shortcomings. When about 40 years of age, he went to Rome as the advocate of his Alexandrian brethren, who had refused to worship Caligula in obedience to the imperial edict. He has left an account of this embassy, into the result of which we need not enter here. Of his life we know little except what is recorded above, and that he once went to Jeruselem. His second mission to Rome, to the emperor Claudius, on which occasion he is said to have made the acquaintance of the Apostle Peter, as reported by Eusebius, is doubtful.

The religious and philosophical system of Philo Judæus, however, which is really the thing of most consequence, is most minutely known, and is deserving of the profoundest study, on account of the vast influence which it has exercised both on the

Jewish and Christian world. To understand his system aright, it will be necessary to remember the strange mental atmosphere of his days, which we have endeavored briefly to sketch in our introduction to Gnostics (q.v.). The Alexandrines had endeavored to make Judaism palatable to the refined Greeks by proving it to be identical with the grandest conceptions of their philosophers and poets, and had quite allegorized away its distinctive characteristics. Philo Judæus was the first man who, although himself to a great extent imbued with allegorizing tendencies, made a bold and successful stand against a like evaporization of the revealed religion of his fathers; which, indeed, in many cases had led people to throw off its yoke also outwardly. A most zealous champion of Judaism, his bitterness in rebuking those co-religionists who tried to defend their secret or overt apostacy by scoffing at the law itself, who were "impatient of their religious institutions, ever on the look-out for matter of censure and complaint against the laws of religion, who, in excuse of their ungodliness, thoughtlessly, argue all manner of objection"—knows no bounds. He cannot understand how Jews, "destined by divine authority to be the priests and prophets for all mankind," could be found so utterly blind to the fact, that that which is the position only of a few disciples of a truly genuine philosophy—viz., the knowledge of the Highest, had by law and custom become the inheritance of every individual of their own people; whose real calling, in fact, it was to invoke the blessing of God on mankind, and who, when they offered up sacrifices "for the people," offered them up in reality for all men.

To Philo Judæus, the divinity of Jewish law is the basis and test of all true philosophy. Although, like his contemporaries, he holds that the greater part of the Pentateuch, both in its historical and legal portions, may be explained allegorically, nay, goes so far even as to call only the Ten Commandments, the fundamental rules of the Jewish theocracy, direct and immedate revelations, while the other parts of the book are owing to Moses: he yet holds the latter to be the interpreter specially selected by God, to whose dicta in so far also divine veneration and strict obedience are due; and again, although many explanations of a metaphysical nature could be given to single passages, yet their literal meaning must not be tampered with. This literal meaning, according to him, is the essential part, the other explanations are mere speculation—exactly as the midrash and some church fathers hold Only that allegorical method differed in so far from that of his contemporaries, that to him these interpretations—for which he did not disdain sometimes even to use the numbers symbolically, or to derive Hebrew words from Greek roots, and the like—were not a mere play of fancy, in which he could exercise his powers of imagination, but, to a certain extent, a reality, an inner necessity. He clung to philosophy, as combined with the law. If the former could be shown, somehow or other, to be hinted at in the latter, then only he could be that which all his soul yearned to be—viz., the disciple of both: a Greek, with all the refinement of Greek culture; and a Jew—a faithful, pious, religious Jew. Nay, he even urged the necessity of allegory from the twofold reason of the anthropomorphisms current in scripture and from certain apparent superfluities, repetitions, and the like, which, in a record that emanated from the deity, must needs have a special meaning of their own, which required investigation and a peculiar interpretation. See MIDRASH, HAGGADA. Yet this fanciful method never for one moment interfered with his real object of pointing out how Judaism most plainly and unmistakably was based upon the highest ethical principles.

His writings develop his ideas and his system in the two directions indicated. In that division of his writings principally, which treats of the creation (*Kosmopoia*), he allows allegory to take the reins out of his hands; in that on the laws (*Nomoi*), on the other hand, he remains remarkably sober and clear, extolling the Mosaic legislation throughout, at the expense of every other known to him. In a very few instances only he is induced to find fault, or to alter slightly, by way of allegory, the existing ordinances.

His idea of God is a pre-eminently religious, not a philosophical one. He alone is the real good, the perfect; the world has only an apparent existence, and is the source of all evil. God is only to be imagined as the primeval light, which cannot be seen by itself, but which may be known from its rays, that fill the whole world. Being infinite and uncreated, he is not to be compared with any created thing. He has therefore no name, and reveals himself only in designations expressive of this "inexpressibility." He is also named the place (the talmudical *Makom*), because he comprises all space, and there is nothing anywhere besides him. He is better than virtue and knowledge, better than the beautiful and the good (*Kalokagatheia*), simpler than the one, more blissful than bliss. Thus, he has, properly speaking, no quality, or only negative ones. He is the existing unity or existence itself (ōn, *ŏn*), comprised in the unpronounceable tetragrammaton. As creator, God manifests himself to man, and he is then called "The beginning, the name, the word, the primeval angel." In this phase of active revelation of God, which is as natural to him as burning is to the heat, and cold to the snow, we notice two distinct sides, the power and the grace, to which correspond the two names of Elohim and Adonai, used in the Bible. The *power* also gives the laws, and punishes the offender; while the *grace* is the beneficent, forgiving, merciful quality. Yet, since there is not to be assumed an immediate influence of God upon the world, their respective natures being so different, that a point of contact cannot be found, an intermediate class of beings had to be created to stand between both

through whom he could act in and upon creation, viz.: the spiritual world of ideas, which are not only "ideals," or types, in the Platonic sense, but real, active powers, surrounding God like a number of attendant beings. They are his messengers, who work his will, and by the Greeks are called good demons; by Moses, angels. There are very many different degrees of perfection among them. Some are immediate "serving angels;" others are the souls of the pious, of the prophets, and the people of Israel, who rise higher up to the deity; others, again, are the heads and chief representatives of the different nations, such as Israel does not need, since they conceive and acknowledge the everlasting head of all beings, himself. The *Logos* comprises all these intermediate spiritual powers in his own essence. See article Logos for Philo's views on this part of his system. Man is a microcosm, a little world in himself, a creation of Logos, through whom he participates in the deity, or, as Scripture has it, "he is created in the image of God." He stands between the higher and lower beings—in the middle of creation. The ethical principles of Stoicism, Philo identified with the Mosaic ethics, in which the ideal is most exalted moral perfectibility or sanctity, and man's duties consist in veneration of God, and love and righteousness towards fellow-men. Philo holds firmly the belief in immortality. Man is immortal by his heavenly nature; but as there are degrees in his divine nature, so there are degrees in his immortality, which only then deserves this name when it has been acquired by an eminence of virtue. There is a vast difference between the mere living after death, which is common to all mankind, and the future existence of the perfect ones. Future recompense and punishment are not taken by him in the ordinary sense of the word. Virtue and sin both have all their rewards within themselves; but the soul, which is "pre-existing," having finished its course in the sublunar world, carries this consciousness with it in a more intense and exalted manner. Paradise is oneness with God; there is no hell with bodily punishments for souls without a body, and no devil in the Philonic system.—Philo's Messianic notions are vague in the extreme, and he partly even interprets certain scriptural passages alluding to some future redeemer as referring to the soul. Yet he indicates his belief in a distant time when some hero will arise out of the midst of the nation, who will gather all the dispersed together; and these, purified by long punishments, will henceforth form a happy, sinless, most prosperous community, to which all the other nations will be eager to belong.

We have only been able to indicate, in the slightest of outlines, the principal features of Philo's theology and philosophy, without endeavoring to follow any one of the manifold systematic schemes into which his scattered half-obscure dicta have been pressed. The influence Philo has exercised upon Christianity and Judaism (in the later writings of which his name occurs as "Yedidyah the Alexandrine") is enormous, and the various articles in the course of this work (Gnostics, Jews, Logos, etc.) dwell more or less upon this point. What he has done for the development of philosophy is discussed under that head and in the articles Plato, Neoplatonists, etc. Of the many works left under his name, several have been declared spurious, but in some cases, without much show of reason. His writings are generally brought under three chief divisions, the first of which comprises those of a more general and metaphysical nature, such as *De Mundi Incorruptibilitate, Quod Omnis Probus Liber, De Vita Contemplativa.* The second contains those written in defense of his compatriots, *Adversus Flaccum, Legatio ad Caium, De Nobilitate.* The third and most important is devoted to the interpretation and explanation of Scripture in the philosophical manner indicated, *De Mundi Opificio, Legis Allegoriarum Libri III.;* containing also a number of special treatises, *De Circumcisione, De Monarchia, De Præmiis Sacerdotum, De Posteritate Caini, De Cherubim,* etc.; five books *On the History of Abraham, De Josepho, Vita Mosis, De Caritate, De Pœnitentia,* etc.; to which also belong *De Parentibus Colendis, De Virtute eiusque Partibus,* first published by A. Maï; and certain very doubtful fragments, first discovered in an Armenian translation, such as *De Providentia* and *De Animalibus,* etc. Many of his works, however, seem irredeemably lost. The *editio princeps* by Turnebus, dates Paris, 1552; reprinted Geneva, 1613; Paris, 1640; etc. Mangey published a more critical edition (Lond. 1742, 2 vols. fol.), and Richter a slightly improved one (Leip. 1828–30, 8 vols.). An edition of Pfeiffer (1785, etc.) remained incomplete. Another edition was published by Tauchnitz (1851, etc.). There are several codd. in the Escurial, in Rome, and St. Petersburg.—Of the scholars who have written on Philo, we mention principally Dahl, Bryant, Gfrörer, Creuzer, Grosmann, Wolff, Ritter, Beer, and especially Drummond in an elaborate exposition of Philo's system. The English translation of Philo in 4 vols. forms part of Bohn's *Ecclesiastical Library.*

PHILOLOGY (Gk. *φιλολογία*; *φιλόλογος*: *φιλεῖν*, "to love;" *λόγος*, "word," "speech," "discourse," "argument"). The term philology has been made to include, in its most extended meaning, the whole intellectual development of a people from the earliest times to the present. Its material, in this signification, is not only language and literature and all that each implies, but it comprehends the entire historical growth of human culture. As it is more commonly used at the present day, it is restricted in its application to the phenomena of language, as such. In this sense philology is the science of language, which it treats as a physiological and a psychological product. Its aim is to account

for the general manifestations of language as a whole, and to trace its particular development among different peoples. By the comparison of different dialects, furthermore, it seeks to establish linguistic relationship where it may be discerned by its processes to exist, and by carrying back all cognate languages to the common source, to follow out in detail the individual growth of each.

In carrying out these latter phases of its task, philology makes use as a means not only of history in its most extended application, but of ethnology and archæology. Two of its most helpful handmaids are the related sciences of palæography and epigraphy. The science of philology, then, concerns itself not with a part, but with all of the problems of language. Its material is speech in its widest sense, whenever and wherever it has been used, whether as an unwritten dialect, or as the record of that which no longer exists as a spoken form. In its signification, as it is here used, of the science of language, it does not concern itself, on the one hand, solely with the etymology of words, as in some phases of its development it has seemed to do, or take account of words and phrases alone from their psychological side in their shifting change of content; neither, on the other, does it deal alone with speech as a phonological product. Both etymology and phonology enter as factors into language investigation, but they are parts, not the whole of the science.

Modern philology, in its use of means, is both historical and comparative. As will be pointed out further on, its earliest beginnings are to be found in descriptive grammar. The task of this last is to record, at any particular stage, the then existing facts of language, to exhibit, in other words, a language as it is. A series of such grammars, it is evident, for all periods of a language, would form together an historical grammar which would show the successive changes that the elements of the language had undergone. There would, however, come a time when the matter for such a grammar would necessarily fail, since back of all recorded material, in every language, lies the period when it only existed as spoken speech. Historical grammar alone, accordingly, if confined to a single dialect, is only able to account for the facts of language as they have been transmitted in that particular dialect. It is not always even able to do this, for many a problem insoluble, or wrongly solved, from the standpoint of one language alone, in which it is found to occur, is to be cleared up by the concensus of information derived from many. In order, then, to carry an investigation in language to its legitimate end, the method used must not only be historical, but by assembling all of the historically acquired facts in the different languages together, it must be comparative. Practically, it can only be in a true sense historical by being at the same time comparative, because in every language, as has been indicated, there are gaps that it is impossible to fill by a reference to that language alone. It was the application of the comparative method in language investigation, as will be explained, that first firmly founded the modern science of philology, which has been and still frequently is called comparative philology, unnecessarily, since to be scientific, at all, it must be comparative. One of the greatest results of these methods of comparison applied to language has been to establish a relationship between dialects, in many cases where it before had not been even remotely apprehended to exist, and to carry most of the languages of culture of the world back to an Indo-European parent speech, every detail of which has else been lost. By the wide observation, comparison, and classification of material gathered from every possible source, this genetic relationship of the dialects has not only been determined, but by processes of inductive generalization, used here, as in the other sciences, it has been possible to discover laws of far-reaching application, which, in their turn, may be applied deductively to explain the intricacies of language. When comparison has been spoken of, in the foregoing, in connection with grammar, it must not, however, be supposed that it is limited to the examination of grammatical forms and characteristics, as such. The whole vocabulary of the related dialects becomes, also, the subject of investigation in accordance with the common principles.

It is only by the use of discovered laws that philological processes have been made real. Early etymologists everywhere, among the Greeks, as among the Icelanders, fall into what, to us, are the most obvious errors, by their ignorance of the underlying principles of correspondence and differentiation. The exterior resemblance, then, as later, was thought to be the only requisite for tracing etymological relationship, as when, for instance, the identity was at one time assumed of *καλέω* and "call," *ὅλος* and "whole," as they may still be found in some English dictionaries. The wide application of law inductively acquired has not only put an end forever to all haphazard attempts to account for the history and kinship of words, but it has proved, among other things, that exterior similarity, or even identity alone, is the poorest possible criterion; that genetic relationship even, under conditions, presupposes diversity, and without that it not only cannot be proved to exist, but, on the other hand, may be proved not to be present at all. By Grimm's Law, for instance, Greek *κ* presupposes, under specific circumstances, an *h* in Germanic. *καλέω* is, accordingly, to be connected with L. calâre; O. H. G. holôn (halôn); O. S. halôn; A. S. holian=E. to hale. *ὅλος* in its turn is to be connected with Sanskrit sárvas; L. sollus; Goth. sêls; it is contained in A. S. sæl-ig, which is a very different word from *whole*=A. S. hâl; O. S. hêl; Goth. hails. The science of philology, finally, as a science which has to do with human mind, is an historical and not a physical science. As has been seen by the foregoing, its methods, too, are historical, as must be

its evidence and its verifications. It is in its processes of inquiry essentially inductive, and, like the other inductive sciences, may, in the end, use its generalizations for purposes of deduction. It is just here that the added evidence of the related sciences is of value, in the light of the substantiating proof that they may bring. The evidence of archæology, or of ethnology, has furnished in many ages corroborating support, while the known facts of history have, in countless instances, verified the inductions of philology, which without them would be, after all, but probable assumptions. It would be wholly possible without history, for instance, to prove the relation of the Romance dialects to Latin, or of English to the Low German of the continent. Philology, however, in all such cases is in position to contribute details that go far beyond historically transmitted facts. It is in this manner, in its turn, a most serviceable adjunct to history, and in some directions it furnishes not only the most conclusive, but almost all the testimony that we have. The great bulk of the information as to the very existence of a primitive Aryan people is furnished by philology alone. We are even able to reconstruct, by a rigid comparison of the related dialects independently of other testimony, which, in most cases, is absolutely lacking, many of the details of their life as they undoubtedly lived it. It is possible, in this way, to prove that the Aryans were a nomadic people, with only the beginnings of agriculture; they had wheeled vehicles, and although they moved about from place to place, they also constructed dwellings of such materials as wood, clay, and twigs; they made material to wear of flax and wool, but apparently knew no metal except copper; they had domesticated the cow, the sheep, and the dog, but none of the birds; they measured the year by lunar months and the month by nights.

In its origin and development the science of philology has been pre-eminently Indo-Germanic, and in its ordinary usage the term "comparative philology" is still only thus applied. This has resulted for several reasons. The modern languages of culture, among which the science has grown up, not only, almost of one accord, belong to the group, but the languages of the ancient nations from whom, above all others, that culture has been derived, are also included within it. Aside from this, the material over the length and breadth of the field is at the same time vastly more abundant, and from the accuracy of its transmission, and its own intrinsic character in general, is actually more important than is elsewhere the case. It is not, however, to be assumed that an investigation of the Indo-Germanic languages alone will be able to furnish a solution to all the problems of language. In the early days of the science it was tacitly taken for granted that all languages in their fundamental facts conformed to the same model, and that which held good of the Indo-Germanic group must necessarily hold good of all. This particular group, however, is, in reality, but one of many, and no more in this, than in any other similar case, is it possible to generalize from it alone. Its laws are its own, and general theories of language are only to be built up by an appeal to the non-related dialects, with which it has apparently nothing in common.

The development of a science of philology has not been, in its general features, unlike that of the other historical sciences. Like others, it began with the simple observation of facts. A general outline of grammar existed in the schools of the Greek philosophers. The critical study of Greek was first begun at Alexandria, where the great scholars of the day, notably Aristarchus and Zenodotus, the first librarian of Alexandria, were engaged in editing texts of the classics, and particularly of Homer. Under their influence, descriptive grammar made long strides in the development of a rational terminology. The first real grammar of Greek was written by Dionysius Thrax, a pupil of Aristarchus, who had settled at Rome. Of the popularity of Greek studies at Rome at this time and subsequently it is hardly necessary to speak in detail. What is scarcely less important, an influence was presently extended to the critical study of Latin. According to Suetonius, grammatical studies in Rome date from Crates of Pergamos, who about 159 B.C. gave public lectures on Greek grammar. Lucius Elius Stilo presently lectured in the same way on Latin, and his pupils, Varro, Lucilius, and Cicero, all became authorities on questions of grammar. The two former were authors of grammatical works, as was their contemporary, Cæsar himself. To the Greek grammar of Dionysius, descriptive grammar owes its fundamental terminology, which was speedily translated into Latin and used by all subsequent writers in its essential forms. During the succeeding centuries grammatical studies were not suffered to lapse. Prominent names are Quintilian, in the first century, Probus and Donatus in the fourth. After the seat of government had been transferred from Rome to Constantinople, we have, in the sixth century, the last great grammarian in Priscian. All of this early grammar was descriptive only; there was no thought of a systematic classification, or a comparison of languages, although, as early as Strabo, four of the Greek dialects were not inaccurately brought together. The classificatory stage in the development of the science properly began with the theologians of the sixteenth century, who had by this time extended their studies to the Semitic languages other than Hebrew.

Attention now began to be directed to linguistic questions on a broader basis. Bibliander, in 1548, published the Lord's Prayer in fourteen languages; Rocca, in 1591, in twenty-six; Megiserus, in 1592, in forty, and in 1593, in fifty. Early in the succeeding century, Estienne Guichard, in his *Harmonie Etymologique* (1606), distinguishes, although by no means correctly in their relationships, since he derives Greek from Hebrew, between four classes of languages corresponding to our modern Semitic, Greek, Italic, and Germanic. Scaliger, in his *Diatriba de Europæorum Linguis* (1610), distinguishes eleven

classes. A great stumbling block to the development of a rational classification at this time lay, however, in the unquestioned assumption that Hebrew was the primitive language of all mankind, and that, consequently, from it all languages may ultimately be derived. It was the service of Leibnitz (1646–1716), finally, to remove this obstacle and to establish the study of language, for the first time, upon a basis of inductive reasoning. At his instigation, a vigorous collection of facts was set on foot. Two great works at the beginning of the century, in this direction, owe their origin directly to his influence, namely, the *Catalogue of Languages* (1800), in six volumes, by Hervey, and the *Mithridates* (1806–17), in four volumes, by Adelung. What acted, however, more than all else to point out the true direction was the attention called in Europe to Sanskrit studies, by the establishment, in 1784, of the Asiatic Society at Calcutta, through whose publications, the language and literature first became accessible to scholars outside of India. One of its members, Sir William Jones, presently, in 1786, pointed out for the first time the unmistakable affinity existing between Sanskrit, Greek, Latin, Gothic, Celtic, and old Persian, which he affirms must have sprung from a common source. In Germany, the results of these new investigations were first utilized by Frederick Schlegel, who had studied Sanskrit in England, and who now, in 1808, published his work, *Ueber die Sprache und Weisheit der Indier*. It was this book which really gave the impulse to the foundation of the science of Indo-Germanic philology. Stimulated by it, Franz Bopp (1791–1867), the actual founder of the science, published at Frankfort-on-the-Main, in 1816, his book *Ueber das Conjugationssystem der Sanskritsprache in Vergleichung mit jenem der griechischen, lateinischen, persischen, und germanischen Sprache*. Bopp, in this first work on comparative grammar, identifies the personal endings of the verbs with originally independent pronouns, and recognizes in the Gothic verbs afterward called weak by Grimm, a union of the root with the preterite of the verb *to do*. A second, and still more important work by Bopp, was his *Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Gothischen, und Deutschen* (1833-52; third edition, 1869–71). The service rendered the new science by Bopp, from the side of comparative grammar, was more than paralleled by Jacob Grimm (1785–1863), the founder of historical grammar, whose great work, the *Deutsche Grammatik*, appeared in 4 volumes, 1819–37. Grimm, in this work, although the modern science has by no manner of means impartially accepted his conclusions, definitely pointed out the subsequent lines of its development. His grammar is not only historical, but it is at the same time comparative. What was most important for the establishment of the study upon a scientific basis was his first formulation of a law of sound, and his certain establishment of the fact that sound changes must and do take place along definite historical lines. Grimm's grammar, although primarily confined to the branches of a single language, is the first great fundamental work in the science of philology, and from the time of its appearance exercised an incalculable influence upon its development. The comparative method was first applied to the vocabularies of the Indo-Germanic languages by August Friedrich Pott (1802–88) in his *Etymologische Forschungen auf dem Gebiete der indogermanischen Sprachen* (1833–36; second edition, 1859–76). The two great summarizing works since Bopp are the *Compendium der vergleichenden Grammatik der indogermanischen Sprachen* (1861; fourth edition, 1876), by August Schleicher (1821–68), and the *Grundriss der vergleichenden Sprachwissenschaft der indogermanischen Sprachen* (1886–92), by Karl Brugmann, which last contains the latest results of the science.

It was the establishment of underlying law in sound change by Jacob Grimm that placed philology permanently on a scientific basis. His statement of the principle of consonantal change, as exhibited in the Germanic group of languages when contrasted with other members of the Indo-Germanic family, showed that such changes of sound in language exist in sequences wholly independent of chance or of volition on the part of the speaker, and it proved, furthermore, that these sequences of sound change are ascertainable along definite courses of development. It is the formulation of these principles of phonetic change that constitute the so-called "laws" of language. It must, however, be borne in mind that these are not physical laws with which we have here to deal. A sound law simply states the regularity observed within a certain group of historical phenomena; it does not, like a law of physics, state what must under given conditions invariably occur. The distinction is to be made, also, between sound change properly so called and that which is simply sound substitution at any given period in a language, as when, for instance, it is said in French grammar that "adjectives in *f* form their feminine by changing *f* into *ve*," as though the feminine form were then and there derived from the masculine, and had not, in its turn, regularly descended from the Latin feminine. Sound substitutions of this sort, and there are many of them, are the results of the working of phonetic laws, but they are not, thus stated, to be construed to express a law of sound change, which latter is invariably considered to mean an historical development that has been carried out within some particular period. The thesis is maintained by the modern school of philologists of the invariability of the working of the laws of sound. It is evident, however, that to be consistent and regular they can only concern themselves with absolutely similar phonetic conditions. In such circumstances, a sound must invariably have one and the same fate: either it must have changed throughout the particular language or dialect into the same other sound, or it must have remained constant throughout. Where a sound originally the same in an older stadium of the language is subsequently represented by various sounds, this may be shown conclusively to be due

to the effect of a difference in phonetic conditions, whether of accent, the influence of neighboring sounds, or the like. The "non-exceptional" working of phonetic law means no more than this. As the principle has concisely been stated: "A given sound in one and the same position cannot give rise to two different sounds."

"Grimm's Law" was originally formulated in the second edition of the first volume of the *Deutsche Grammatik*, which appeared in 1822. While the formulation of the process as a law unquestionably belongs to Jacob Grimm, the discovery of the fact of the existence of these particular series of sound changes does not. Single stadia of the process had long been recognized. Examples illustrative of the entire permutation, intermixed, to be sure, with many wrongly assumed phonetic changes, are contained in the *Svenskt Dialect Lexicon* of the Swede Joh. Ihre, which was published in 1766. Rasmus Kristian Rask (1787–1832), in his work on the origin of the Old Norse language, *Untersögelse om det gamle Nordiske eller Islandske Sprogs Oprindelse*, which appeared in 1818, gives the results of the process in all its details, with the exception that he makes Greek-Latin *b* equivalent to Germanic *b* (see below). To Grimm, however, belongs the merit of having brought the details together under a single formulation, and the law which thus arose, as is eminently fitting, received his name. It has, nevertheless, since his original statement of it undergone not unimportant correction. "Grimm's Law," or the First, or Germanic, Permutation of Consonants (*Lautverschiebung*), may be thus stated: Before the differentiation of the common, or primitive, Germanic language into the separate Germanic dialects, the Indo-Germanic tenues, tenues aspiratæ, mediæ, and mediæ aspiratæ underwent the following shifting: The Indo-Ger. tenues *p, t, k, q*, became in primitive Germanic the voiceless spirants *f*, þ(*th*), *h*, *h* (*hw*): e.g., Sansk. pad–, Gr. *πούς*, Lat. pēs, Goth. fōtus, A. S. fōt, foot; Sansk. tráyas, Gr. *τρεῖς*, Lat. trēs, A. S. þrī; Sansk. çvan–, Gr. *κύων*, Lat. canis, Goth. hunds, A. S. hund, hound; Lat. capio, Goth. hafjan, A. S. hebban, heave; Gr. *λείπω*, (*leiqo), Lat. linguō, Goth. leihwan, A. S. lēon (*lihan), lend. In the combination *s* + tenues the Indo-Ger. tenues remained unshifted, as did also the *t* in the Indo-Ger. combinations *pt, kt, qt*. The Indo-Ger. mediæ *b, d, g, g* (velar) became the tenues *p, t, k, k* (*kw*): e.g., Lat. lūbricus (*slūbricus), Goth. sliupan, A. S. slūpan, slip; Sansk. dáça, Gr. *δέκα*, Lat. decem, Goth. taíhun, A. S. ten; Sansk. jānu, Gr. *γόνυ*, Lat. genu, Goth. kniu, A. S. cnēo, knee; Lat. gelu, Goth. kalds, A. S. ceald, cold; Gr. *βίος* (*gīwos), Lat. vīvos (*gwīvos), Goth. qius (Ger. qiwis), A. S. cwicu, quick. The Indo-Ger. tenues aspiratæ became voiceless spirants in primitive Ger., and were thus merged with the voiceless spirants which arose from the Indo-Ger. tenues, together with which they underwent all further changes. The tenues aspiratæ were, however, of rare occurrence in Indo-Ger., and may be left out of consideration here. The Indo-Ger. mediæ aspiratæ first of all became voiced spirants; ultimately, original *bh, dh* initially, and *bh, dh, gh* medially after nasals became the voiced explosives *b, d, g*: *e.g.* Sansk. bhárāmi, Gr. *φέρω*, Lat. fero, Goth. baíran, A. S. beran, bear; Sansk. dhāma, Gr. *θή-σω*, Goth. ga-dēps, A. S. dæd, deed; Sansk. jámbhas, Gr. *γόμφος*, A. S. comb; Sansk. bándhanam, Goth., A. S. bindan, bind; root angh–, Gr. *ἄγχω*, Lat. angō, Goth. aggwus, A. S. engi (narrow). The changes here noticed were only gradual, and in their beginnings were doubtless already present in the parent language. There are varying theories as to the order in which they took place. It is probable, however, that the tenues first became spirants. The tenues aspiratæ and the mediæ aspiratæ then became, in the one case, voiceless spirants, in the other, voiced explosives. In this manner, as has been stated, the tenues and the tenues aspiratæ fell together. Finally, the mediæ became tenues. A second stadium of the process, commonly called the Second, or High German, Permutation of Consonants, subsequently took place within German territory itself, and differentiates the dialects of South Germany, or High German, whose consonants underwent the additional shifting, from the dialects of North Germany, or Low German.

As "Grimm's Law" had been formulated it still left unexplained a large number of instances which were originally considered as exceptions to its working. A considerable class of these so-called exceptions exhibited in Germanic, for Indo-Ger. p, t, k, at times *b, d, g*, instead of the regular *f*, þ(*th*), *h*. Karl Verner, in 1877, (in a paper in Kuhn's *Zeitschrift für vergleichende Sprachforschung*, vol. xxiii.) explained this irregularity, and established it under a phonetic law. It was proved that where the difference occurred it was connected with the earlier accentuation of the Germanic languages, which at one time corresponded with the free Indo-Germ. accent as exhibited in Greek, or more perfectly still, in Vedic Sanskrit. In the case of *bhratar*, for instance, the accent lay on the first syllable, but in the corresponding form *pitâr*, on the last; in Gothic we have *bropar*, A. S. *brôðor*, but Goth. *fadar*, A. S. *fæder*. "Verner's Law" is to be thus stated: After the first permutation of consonants had been completed, but before the principal accent was confined, as in later Germanic, to the root-syllable, a regular interchange took place between the voiceless and the voiced spirants. The spirants *f*, þ(*th*), *h*, *hw*, *s*, medial or final, became *b, d, g, gw, z*, except in the combinations *ft, fs, ht, hs, sp, st, sk, ss*, when the vowel next preceding them did not bear the principal accent: e.g. Sansk. pitár-, Gr. *πατέρ-*, Goth. fadar, A. S. fæder, father; Sansk. çatám, Gr. *ἑ-κατόν*, Lat. centum, Goth., A. S. hund, hundred; Gr. *ἑκυρά*, A. S. sweger (mother-in-law); Gr. *δεκάς*, A. S. -tig (decade). The process called by Holtzmann "grammatical change," in the Germanic languages, owes its origin to differences in accentuation under this law: e.g. A. S. *céosan*, has in the past sing. *cēas*, plur. *curon*, past part. *coren*; *snidan*, in the same way, has *snâð*, *snidon*.

sniden ; têon has *téah, tugon, togen,* which differentiation is due to the fact that in the infinitive and the past sing. the accent fell, as now, upon the first syllable ; in the past plur. and the past part., however, it originally fell upon the termination. In the case of *céosan, lêosan.* and the like, the Germ. *z* was regularly developed to an *r*, as above, in some of the languages of the group. "Verner's Law" was of extraordinary importance to the science of philology, not merely because it cleared up a hitherto inexplicable phonetic condition, and directed attention to the weighty part played by accent in the development of sounds, but even more than this, because it proved conclusively the wider and surer range of law in language changes. It showed that if two sounds were developed out of what was originally one and the same sound, it was not a matter of chance, but that there were definite reasons for the differentiation. It stamped the whole manner of procedure in philological investigation, in short, as indubitably real and scientific, and beyond the imputation of haphazard, which had often enough been cast upon it in its earlier days. Verner, in his formulation of the law, recognizes this fact in that he appends, as a corollary, the statement : "The First Permutation of Consonants does not permit, aside from the preservation of consonants in some certain complexes, a mass of exceptions." "Verner's Law" has since been widely applied, and its scope has been extended. Conway has used its principle to explain the absence of rhotacism in certain Latin forms ; we have, for instance, *âsinus, caêsariês, vâsum,* but *gêneris, gerêbam, Aurêlius, nâris.* The law cited under his name is to the effect that : Wherever in Italic an *s*, medially between vowels, followed an accented syliable, the resultant was a *z* in the non-rhotacising dialects, like Oscan, but *r* in the rhotacising dialects, like Latin and Umbrian ; if the accent immediately preceded, the *s* was preserved, except in Latin and Faliscan, where, nevertheless, the change to *r* still took place if the *s* was followed by *i* or *u*, and the same vowels, or a long vowel or diphthong, preceded. Moulton, in the law cited under his name, uses the principle of "Verner's Law," again, to account for the presence of a tenuis in Greek, instead of the regular hard aspirate. His own formulation is that : "Original hard aspirates lose their aspiration in Greek, except where the accent immediately precedes." We have, for instance, *οἶσθα* and *ἐστέ* (Sansk. sthá) ; Sansk. -thá and Gr. *-τός* ; Sansk. mithás and Gr. *μετά.* "Siever's Law" takes account of the fact that in place of the *gw*, which by "Verner's Law" should appear in primitive Germanic for original *hw*, there is found, in unaccented syllables, by "grammatical change" a *w*. We have, in this way, in Goth. *mawi*, maid, instead of *magwî* ; A. S. *gesewen*, instead of *gesegwên.* "Paul and Kluge's Law" accounts for a class of exceptions to "Grimm's Law" in which *gg, dd, bb* (which have arisen either from Indo-Ger. *ghn, dhn, bhn*, by "Verner's Law" from *kn, tn, pn*, or from original mediæ plus *n*), become *kk, tt, pp*, when the accent originally followed.

Leskien, in his work, *Die Deklination im Slavisch-Litauischen und im Germanischen* (1876), first expressed the thesis of the invariability of phonetic law. The statement was not only not allowed to pass unchallenged, but met with active opposition. Philologists were presently divided into two parties, and the so-called "new school" of philology arose, which has ultimately remained in possession of the field, and has given to the science its present form. The new school based its assumptions primarily upon the doctrine of the non-exceptional working of the laws of sound change, which it endeavored to carry out with far greater consistency than before. The physiology of sound, as exemplified in language, was made the subject of more careful investigations, and the results were more strictly applied to explain the phenomena of change. Many apparent irregularities in sound were in this manner proved to be, in reality, due only to their graphic representation. Factors like accent, that had before not been sufficiently taken into consideration, were found to be capable of wider application. In particular, the principle of the working of "false analogy," so called, received a complete justification as a working factor in language change in all periods of its history, instead of being considered an irregularity of only incidental occurrence. The new school, accordingly, has simply carried forward to their fullest conclusion principles already established as fundamental. Philologists like Georg Curtius (1820–85) and Schleicher, who represented the opposition to the newer views in their entirety, are by no means to be adjudged in contempt of phonetic laws, which they applied more consistently than did their predecessors. They did not, however, believe in the unvarying character of their working. Curtius, particularly, held to and sought to justify, beside the regular sound changes covered by law, irregular or "sporadic changes"—changes, namely, that were found in some instances, only, in the occurrence of a sound, and not in all under identical circumstances. The new school, with their thesis that phonetic law is invariable, rigidly exclude the possibility of "sporadic change." A sound change within a given area of speech at a particular phase of its development will not be found to occur in one instance and to be wanting in another. The same sound under similar circumstances will be similarly affected.

One of the most important services of the new direction in philological investigation has been to call increased attention to the fundamental conditions of language development in general. If the external characteristics of language as a physical product had been more accurately investigated in the light of the more perfect elaboration and application of the science of phonetics, so its internal characteristics as a psychological product were now observed with greater care. Steinthal, particularly in his work *Einleitung in die Psychologie und Sprachwissenschaft* (1871), among others, has investigated

language from its psychological side, as has also Whitney, in a more popular way, in his *Language and the Study of Language*, and *The Life and Growth of Language*. The application of the facts of the psychology of language to the details of the modern science has been the service, before all others, of Hermann Paul, whose work, *Principien der Sprachgeschichte*, appeared in 1880. Paul here definitely directs attention to the important part played by analogy in language change. Single words attract each other in the human mind, the result being the appearance of a quantity of larger or smaller groups; such an attraction, furthermore, always being dependent either upon a correspondence of the sound, or of the meaning, or of both conjoined. Analogy, in this way, is a conservative force in language, and works to secure its transmission and its continuity with at least some degree of regularity. It is, however, for just this reason, a destructive force, since the tendency toward regularity and uniformity not seldom results in destroying forms which do not conform to some given group. It is, however, at other times distinctly a creative force, and all living languages are constantly being added to by the creation of new forms on the analogy of those already existing. There is no reason to suppose that analogy has not operated in these directions at all periods in the history of a language. A particular effect of the working of analogy is the reaction against isolation of form. It has had, in this way, a "leveling" tendency, whose result has a most important bearing upon a true appreciation of the processes of change. By comparing the associated groups present in our own consciousness with those which it can be proved existed in a past period of the language, it will readily be found that in many instances forms previously connected are no longer considered to belong together. This has been the result, principally, of a change in sound, or a change in signification. A familiar instance of this process of isolation is the word *forlorn*. By the operation of "Verner's Law," *forloren* was the regular past part. of the A. S. verb (*for*)*lēosan*,—*lēas*, —*luron*,—*loren*. There is no thought now, however, of a connection with *to lose*; it has been completely isolated from its original grouping. *Forlorn* is the survival of a group which well illustrates, as a whole, the tendency of language to react against formal isolation. Instances were cited under "Verner's Law," in which the past plur. and the past part., by "grammatical change," had a different consonant from the present and the past sing., like A. S. cēosan—cēas—curon—coren. Already in Anglo-Saxon the traces of this process in many cases has disappeared by the intrusion of the consonant of the present stem, with the result that all tenses in these, as was the case in the great majority of verbs, exhibited the same consonantal conditions throughout. Those forms which still retained the older consonant became, as a consequence, more and more isolated from the groups with which they were really connected, and in their turn were ultimately merged with what were felt to be the normal forms. In the noun declension almost all traces of the working of this law had disappeared even in earliest Germanic. It has been pointed out that if phonetic development were the only agent in the history of language, the result would be an infinite variety of forms only loosely connected, or even, it may be, absolutely unconnected. The tendency to react against isolation is a unifying force that must be taken into strict consideration in etymological processes on account of its effect to obliterate previous phonetic conditions which, in many cases, the laws of language alone can show to have once prevailed. The controlling principles in this matter of isolation, and the reaction against it, are formulated as follows: "The greater the phonetic distance of two differentiated forms the greater is the power of resistance against unification and equalization." By virtue of this principle we still have, for instance, *forlorn* from *lose* and *sodden* from *seethe*. "The closer the etymological connection is between differentiated forms, the sooner will unification be effected." Various forms of the same tense, for instance, or the various cases of the same noun are felt to be more closely connected than are the various tenses of the same verb, or the nouns of the same declensions, and consequently they are much more readily affected. A third principle is that "the greater the intensity with which differentiated forms are impressed upon the minds of the community, the greater will prove their power of resistance against unification." Sometimes a differentiation in form coincides with a difference in function, although in its origin there was no necessary connection between them. In such a case the phonetic condition is strengthened to persist, and in its turn may become associated with the difference in function to the extent that it is supposed absolutely to indicate it. Such an instance is found, for example, in the plurals of *tooth, foot, man*, formed by *umlaut*, viz., *teeth, feet, men*. Originally, however, *teeth, feet, men* were, in the same way, found in the dat. sing., as well as the nom., and acc. plur.; the rest of the sing., the nom., acc., and gen., had a different vowel, e.g., *fōt, fōtes*, which presently made its way into the dat.; the whole sing. thus had its distinctive vowel, which was now contrasted with that of the nom. and acc. plur.; this, in its turn, crowded out the vowel felt to belong to the sing., from the gen., and dat., e.g. *fōta, fōtum*, and the umlauted form became indicative of the plural and the plural alone.

If the effect of phonetic change is, in manifold instances, to produce differentiation which did not originally exist, it is, nevertheless, in many others to obliterate differences that once existed. In this way sound change, again through the working of analogy, operates to produce new groups. The simplest operation of this process is seen where words unconnected, either by etymology or by signification, acquire the same form. Of this character are, for instance, *grave* (A. S. *grāfan*)—*grave* (Fr. *grave*, Lat. *gravem*); *pale* (Fr. *pal*, Lat. *pālum*)—*pale* (Fr. *pâle*, Lat. *pallidum*). A second process of the kind is exhibited in forms in which by phonetic development merely a close resemblance had

been produced, and one form or the other was then changed on account of its supposed connection with the rest. So-called popular, or "folk," etymologies fall under this head, as where, for instance, *sparrow grass*, or even *grass*, appears for *asparagus*. Phonetic development has worked even more actively in the grouping of the systems of inflection. This is again a most important matter in comparative grammar. It has made itself felt in two directions. In the one, forms which have had identical functions come ultimately to coincide; in the other, coincidence is exhibited in forms which have originally had different functions. "Leveling" of the character first mentioned has acted beneficially toward a simplification of language without any apparent disadvantage. In Gothic, for instance, the comparative of adjectives was formed with the suffix *-iz* or *-ôz*, the superlative with *-ist* or *-ôst;* in O. H. G. the comparative and superlative were *-iro*, *-ist*, or *-ôro*, *-ôst;* in A.S. there was but a single termination for the comparative, i.e., *-ra*, but still two for the superlative, viz., *-ost* and *-est*, which in modern English has been reduced to *-est* alone. Such a convergence, however, is not necessarily so complete. In the case of inflections, words originally belonging to one system have not infrequently, in much the same way, gone bodily over to another. Sometimes, on the other hand, this convergence has exhibited itself in some forms alone, but in all words of certain groups, or it has possibly affected only some forms of some words. The history of declensions in the Germanic languages, for instance, furnishes abundant instances of the leveling results of these processes, and it is only by an appeal to comparative grammar that it is possible to reconstruct original conditions. Even in Gothic, the declensions are found to be merged, and modern English shows the ultimate result of such a process. In the case of the coincidence of forms which have had at one time different functions, examples are not far to seek. Our own personal pronouns furnish a striking case in point, as do the strong verbs in the frequent convergence of the past sing. and plur. and the past part. into one and the same form. The recognition of the undoubted tendencies of analogy, both before and after the working of any given phonetic law, is one of the most instructive phases of the modern science. It has cleared up many apparent inconsistencies in the development of forms, and must, henceforth, be used as a working factor in all investigations of the problems of language.

According to their principle of formation the languages of the world are classified, and within the classes thus formed groups or families of language are distinguished, whose members are genetically connected with each other, in that all are descended from a common parent speech. Such a classification is, accordingly, on the one hand, morphological; on the other, genetic. In the one case it is exhaustive, in that all languages are comprehended within it; in the other it includes only those between which relationship has as yet been proved to exist. In accordance with their manner of formation, two great classes of languages are made: the one Isolating, or non-inflexional; the other, Inflexional. The Isolating languages show an absence of all inflexional structure. Such languages are, for instance, the Chinese, the Siamese, and the Tibeto-Burman group. The Inflexional languages exhibit the process of inflexion in all phases of completeness. Some of them, like the so-called "agglutinative" languages, possess it only in a slight degree. Their elements are only loosely aggregated in words and forms, which often take the shape of intricate derivatives, with varying degrees of obliteration in the form of their constituent parts. Such languages are, for instance, the great Turanian group, which includes, among many others, Turkish, Finnish, and Hungarian, and the Malayo-Polynesian languages. The "poly-synthetic" languages also exhibit agglutination, but specifically tend toward an absorption of the whole sentence into the verb, with the effect that the several parts of a sentence are fused into a single word. Such languages are those of the Indians of both North and South America. The "incorporating" languages, also agglutinative, incorporate into their verb relations, else usually expressed by independent words. Such a language is Basque. Other languages are sometimes specifically classed as "prefix-pronominal," like the Kafir dialects, or "semi-inflexional," like Hottentot.

Languages of the purely inflexional type are those belonging to the Semitic and the Indo-Germanic families. The Semitic languages exhibit inflexion in its most perfect form. In addition to inflexion by terminations, as in our own group, they are characterized by two distinctive peculiarities, viz.: the triliteral nature of the roots and their inflexion by variation of internal vowel. The Semitic root, namely, is made up in each instance of three unvarying consonants, the varying forms of the idea being expressed by change of vowel. Next to the Indo-Germanic family, they have been most thoroughly investigated from a modern standpoint, with the result of a well-founded science of Semitic philology, whose domain is being constantly extended.

Inflexion in the Indo-Germanic languages is a process that has only been gradually developed. Back of the inflexional period was a root period, so called, when suffixes were not yet attached to words. These suffixal elements are of two kinds, formal and inflexional, the latter being either case or personal endings, or stem-forming suffixes. Both word-formation and inflexion, accordingly, arose by composition, but many of the suffixes, even in the Indo-Germanic period, were no longer felt to be parts of a composition. The process is, then, a fusion of independent elements in both derivation and inflexion. To find the root of a word, it is in general terms necessary to remove from it all formative elements. It is not, however, certain that the forms thus arrived at actually represent the words of the root period, since both the analysis of the suffixal elements is uncertain and inflexional compounds were early subjected to phonetic change.

Whether the roots were only monosyllabic, or only polysyllabic, or were both, it is impossible definitely to say.

The Indo-Germanic family has been variously called. This particular appellation was chosen by Bopp, and has now generally been sanctioned by scientific usage. It indicates the entire speech area of the family, from India to its farthest limit in the Germanic north. "Indo-European" is often used in its stead. "Sanskritic" and "Japhetic" were terms of earlier application that have been discarded. The name "Aryan," which is due to Max Müller, is now less frequently applied to the family of languages as a whole than to the Indian-Iranian group, or to the primitive people of the race. The Indo-Germanic family of languages falls into eight main groups or branches. These are: (1) Aryan. This consists of the Indian and Iranian minor groups. The oldest dialect of the Indian group is the language of the Veda, the most archaic parts of which are supposed to go back as far as 1500 B.C. Sanskrit, strictly so called, or classical Sanskrit, is the continuation of a dialect that existed parallel with that of the Veda. It became the literary language of India, and as such acquired a fixed and artificial form. Prākrit, of which as early as the third century B.C. there were three principal dialects, was the vulgar language. As Pāli it became the literary language of Buddhism. From the dialects of Prākrit have descended the modern Indian languages: Hindi, Hindustani, Bengali, Maharatti, Scindhi, Punjabi, and others, together with the Romany (Gipsy) dialects. The oldest dialects of the Iranian group are Old Persian (West Iranian), the language of the Persian cuneiform inscriptions, from about 520–350 B.C., and Avestan, also called Zend and Old Bactrian (East Iranian), the language of the Zoroastrian Avesta. Two dialects are distinguished in the Avesta, the less archaic of which is called Later Avestan, or Zend in a strict sense. Neither Old Persian nor Avestan has direct descendants. The Modern Persian dialects, Kurdish, and Ossetian, are more nearly related to the former, and Afgan (Pastu) to the latter. (2) Armenian. The literary language, Old Armenian, goes back to the fifth century. The modern dialects are widely separated from the literary language. (3) Greek. Various dialects are found to occur at the beginning of the historic era. These are classified as follows: Ionic-Attic; Doric; North-West Greek; Æolic; Elean (which may belong to the North-West group); Arcadian-Cyprian; Pamphylian. The dialects are found in a pure form almost solely in inscriptions. The earliest literary language exhibits artificialities of construction. Out of the Attic dialect a common literary language was developed toward the end of the fifth century B.C. Modern Greek is divided up into a multitude of dialects. (4) Albanian. This, the language of ancient Illyria, has only been known to us, to any great extent, since the seventeenth century, and has, as yet, been insufficiently investigated. (5) Italic. The branch consists of Latin, and the Umbrian-Samnitic dialects. Latin is known to us since about 300 B.C. The literary language had already been differentiated from the popular dialect at the beginning of the archaic period of literature, and this process was still further developed in the classical period. The popular dialects of Latin come to light again in the Middle Ages in the various provinces of the Roman Empire. They ultimately developed into the important group of the Romance languages, whose members are: Portuguese, Spanish, Catalanian, Provençal, French, Italian, Rætoromanic, and Roumanian. The Umbrian-Samnitic dialects are known through inscriptions from the last centuries before the Christian era and through words quoted in Latin authors. Umbrian and Oscan are best known. (6) Keltic. The languages of this branch are divided into three groups: Gallic, Britannic, and Gaelic. We have only an imperfect knowledge of Gallic through words quoted in Greek and Latin authors, and from inscriptions. Britannic is divided up into Cymric (Welsh), Cornish, and Bas Breton (Armorican). It is possible to follow Cymric and Bas Breton since the eighth or ninth century, and Cornish somewhat later. The former still survive; Cornish became extinct at the beginning of the present century. Gaelic is made up of Irish, Scotch (or Gaelic in a strict sense) and Manx, the dialect of the Isle of Man. Irish and Scotch, are scarcely differentiated in the ninth century. The oldest remains are the Old Gaelic Ogam inscriptions, so called, in runes, from about 500 A.D. Literary Irish begins in the eighth century, Scotch somewhat later. Manx has only been known to us during the last centuries. All three dialects survive. (7) Germanic. The Germanic branch is divided into three groups: Gothic, Old Norse, and West Germanic. Gothic, as a whole the most archaic language of the group, has been preserved principally in the Bible translation of the West Gothic bishop Ulfilas (311–383 A.D.). It is sometimes known as Moeso-Gothic, from the home of this branch of the Goths in the province Moesia. The East Goths, in the Crimea, kept their language to modern times, but it is unknown to us with the exception of isolated words. Old Norse (Scandinavian) is sometimes classed with Gothic, with which in some respects it closely coincides, as East Germanic. Down to the so-called Viking age (800–1000 A.D.) it was practically a single language, but later was differentiated into two groups: West Norse, consisting of Norwegian, Icelandic, and Faeroese; and East Norse, including Swedish, Gutnic, and Danish. The oldest remains are runic inscriptions, perhaps from the fourth century. West Germanic is made up of Anglo-Saxon, the progenitor of Modern English; Old Frisian; Old Saxon, sometimes called Old Low German, now Low German, or *Platt Deutsch;* Old Low Franconian, whose modern representatives are Dutch, Flemish, and the dialect of Lower Franconia; and Old High German, from which have come the dialects of Upper (South) and Middle Germany. The oldest literary records of these languages, with the exception of Frisian, date from the

eighth and ninth century; Frisian has been known to us only since the fourteenth century. (8) Baltic-Slavonic. The Baltic group consists of Prussian, Lithuanian, and Lettic. Of the first we have only imperfect remains from the fifteenth and sixteenth centuries. The others go back to the sixteenth century, and still survive. The Slavonic languages are divided into a South-Eastern and a Western group. The former consists of Russian (Great Russian and White Russian, Little Russian); Bulgarian; and Illyrian (Servian and Croatian, Slovenian). The latter includes Czech (viz., Czech in a strict sense, Moravian and Slovakian); Sorabian or Wendish; and Lechish (Polish and Polabian, or Elbe-Slavonian). All, with the single exception of Polabian, still survive. The most archaic language of the group is that called variously Old Slovenian, or Old Bulgarian. It was the language of the Slavonic apostles, Cyril and Methodius, in the ninth century, and became the language of the Greek Church. As modified through the influence particularly of Russian, it is commonly known as Church Slavonic.

All the languages thus enumerated form together the material of Indo-Germanic philology. By a comparison of the separate groups of the whole Indo-Germanic family, it is possible to deduce the stage of development that all must have possessed in common before their sharp differentiation into dialects. Such a stage is called the Indo-Germanic parent language, which is capable of reconstruction, both as to its suffixes of formation and inflection, and much of its vocabulary. The absolute homogeneity of such a parent speech, or of the people who spoke it, is, however, no longer assumed. Dialectic, as well as tribal differences, existed even in primitive times. While there was over the whole Indo-Germanic area, to a certain extent, a common linguistic norm, there were, on the other hand, characteristic deviations from it, in different parts of this territory; the sharper differentiations, which ultimately became the separate languages, being connected by transition dialects which only gradually shaded off into them. This transition theory is not only in accord with the laws of dialectic diffusion as we know it to exist, but it is better able to account for the facts of relationship between the members of the family than was the older "pedigree" theory, which assumed a development of dialectic difference only after the separation of a part of the people from the originally homogeneous whole. Greek, for instance, has correspondencies with Indo-Iranian on the one side, and with Latin on the other, which are readily accountable for by the conditions of transition. In the same way, Latin-Greek have peculiarities common to them alone, as have Keltic-Latin, and Sanskrit-Letto-Slavonic. The languages together, before the actual dispersion of the various peoples, would have, not identity, but, necessarily, a by no means inconsiderable degree of uniformity. Their common phonetic condition can be determined by a comparison of the sounds of the different groups, in the light of a knowledge of the laws of subsequent sound change. That they have common inflexional elements has already been stated. Their common vocabulary is approximately brought together by the presence in several groups geographically widely removed of the same word, although here the process is far less sure, as it is impossible with certainty to determine whether a word may not have disappeared entirely, or have been preserved in an isolated instance in a single group.

As to the original home of the Indo-Germanic people before the dispersion, and the consequent area of the common speech, theories are still widely at variance. Schrader, with great plausibility, makes out the locality of common European culture to have been the country between the Danube and the Black Sea on the south, the Dnieper on the east, the Carpathians on the west, and the swamps and forests of Volhynia on the north. The Indo-Iranian culture was in the ancient provinces of Sogdiana and Bactriana in Eastern Iran. An area suitable for the joint life of both is found in the basin of the Middle Volga, north of the steppes of the Caspian, a conclusion that is fairly well substantiated by the character of the common vocabulary.

The grouping of the Indo-Germanic family, as here given, is, of course, linguistic and not ethnological. It does not by any manner of means follow that the people who now speak, or who spoke in past periods, the related dialects of the family, or of the group composing it, necessarily belong to the same race. As it has been concisely put, "language and race are not convertible terms." History has numerous instances of the displacement of one language by another. This was the case, to cite single examples, in Gaul and Spain, where Latin crowded out Keltic; in Prussia, where German has dispossessed Slavonic; in Ireland and Cornwall, where English has taken the place, again, of Keltic dialects; the Normans in France and England, and the Franks in Gaul, gave up their language for that of the people they had conquered; and a modern instance of a community as heterogeneous as possible from an ethnological standpoint, but speaking the same language, is furnished by our own. That this same process happened in the remotest past is not only possible, but probable. It does not, however, in any way disprove the idea of such a fundamental linguistic relationship as has been described, or the original unity of an Indo-Germanic people.

PHILOME'LA, the name of a personage in Greek legend, who was changed according to one account into a swallow, to another into a nightingale. Modern poets are (or rather were, for it was chiefly an 18th c. fashion) fond of calling the nightingale by its classical name.

PHILOPŒ'MEN, the most illustrious patriot and general who figures in the later history of Greece, belonged to one of the best families of Arcadia, and was b. at Megalopolis about 252 B.C. At an early age he lost his father, and was brought up by a wealthy citizen, named Cleander, who took care that he should receive an excellent education. His earliest experiences of war were confined to the border raids of the Arcadians into Laconia; but in 222 B.C,, he was one of the defenders of Megalopolis against Cleomenes, king of Sparta. Next year, when the Macedonian king Antigonus marched to the assistance of the Achæans, Philopœmen joined him at the head of 1000 horse, and contributed materially to the terrible defeat which the Spartan king received at Sellasia. As tranquility was now for a short time restored to Greece, Philopœmen went abroad to perfect himself in the art of war, and served in Crete with such distinction, that on his return to the Peloponnesus, in 210, he was appointed general of the Achæan horse, and at once proceeded to discipline his men in a vigorous and masterly style. In the expedition against Elis (209) he slew the Elean leader, Demophantus, with his own hand. In 208 he was raised to the highest military dignity then possible in Greece, being elected *strategus* or commander-in-chief of the Achæan league, and in this capacity signalized himself by the great improvements which he effected in the drill, discipline, and armor of the Achæan soldiery. It seemed as if the ancient heroism of the land were reviving. The battle of Manteneia, which took place in the course of the same year, and in which the Spartans were again utterly routed—their general and king, Machanidas, falling by the sword of Philopœmen himself—raised him to the pinnacle of fame, and at the Nemean festival which followed he was proclaimed liberator of Greece. His exalted honors did not in the slightest degree disturb the integrity of his character. So great was his influence over his quarrelsome countrymen, that the Macedonian monarch, Philip, began to fear that Greece would regain its independence, and tried to have him secretly assassinated; but the infamous treachery was discovered in time, and its only effect was to endear Philopœmen still more to the Achæans. Another of his determined enemies was Nabis, successor of Machanidas in the "tyranny" of Sparta, but in 201 he inflicted on the latter a severe defeat at Skotetas on the borders of Laconia. During the next few years he was absent in Crete, partly, it would seem, for political reasons, but returned to the Peloponnesus in 194 to find matters in a serious condition. A new and dreaded power—the Romans—had appeared, and overthrown both Philip and Nabis, and Philopœmen foreboded future mischief to all Greece from these ambitious warriors. On the departure of the consul Flamininus, Nabis recommenced hostilities against the Achæans; Philopœmen was once more appointed strategus (192); and in a pitched battle nearly annihilated the troops of Nabis, who himself was shortly afterward killed by the Ætolians. He now exerted all his power to head the divisions among the Achæans, and to prevent them from affording the Romans a pretext for taking away their independence. In 188, he took a fierce revenge on Sparta for having put a number of his friends to death, and was in consequence strongly censured by the Roman senate, and by Q. Cæcilius Metellus, who was sent out as a commissioner to Greece in 185. Two years later Philopœmen (now an old man of 70) was elected strategus for the eighth time. When lying ill of a fever at Argos, news was brought to him that the Messenians had broken their connection with the league; Philopœmen instantly rose from his sick-bed, hastened at the head of some cavalry to quell the revolt, but was overpowered by numbers, and fell into the hands of Deinocrates, the leader of the Messenians, who two nights after sent him a cup of poison, which Philopœmen drank off and died. The remains of the hero were brought in solemn procession to his native city—the historian Polybius carrying the urn—and statues were erected to his memory by his grateful and repentant countrymen.

PHILOSOPHICAL ANATOMY, an arrangement of anatomical science by which it is sought to exhibit the developmental connections between the various parts of one ani-

mal as well as correspondences between the organs of different animals. It therefore includes, or at least makes use of, comparative anatomy, but it aims to go a step farther, in establishing an archetype for all forms, belonging to each sub-kingdom of animated nature. This is the broadest definition, probably, that can be given, consistent with the very varied views which have been taken of the subject by different naturalists.

PHILOSOPHY. This word meant originally the "love of knowledge," and indicated, therefore, a special taste, appetite, or desire, of which the subject matter was knowledge. At first, man's pursuit of knowledge was subservient to the immediate uses of life; but, in the course of time, an interest was taken in knowing the order of the world, independent in its application to the common utilities. We find that this stage had been reached in Greece especially, about five or six centuries before Christ; at which time the name "philosophy" took its rise, being attributed to Pythagoras.

The word has a variety of acceptations, although all pervaded by the one idea of employing the human understanding in the search for increasing knowledge and certainty. It always implies this effort in a distinguished degree, such as only a few persons in any age have ever been able to sustain. The pursuit of knowledge had to become an end in itself, for the mere improvement or practice would not at first have been a sufficient motive for men to undergo the labors of scientific inquiry. Indeed, this improvement was not at all apparent as a consequence of the earlier efforts of speculation. As one celebrated example, the investigation of the properties of the sections of the cone—the ellipse, parabola, and hyperbola—was without any practical use for nearly two thousand years.

As may be readily supposed, the precise aim of philosophy, the statement of what constitutes its end, has varied with the advancement of its study. In modern times, the pursuit of truth has taken a well-defined tone, expressed by the name science (see SCIENCES). But in the ancient world this operation was a mixture of speculation, practice, and sentiment—of legitimate inquiry with aspirations after the unattainable; and hence the word "philosophy," in its modern employment, often refers to the subjects that have not as yet adopted the strict scientific form. On this view, science is the goal and grave of philosophy. (See Lewes's *Biographical History of Philosophy*.) It is chiefly with reference to morals, metaphysics, and the human mind generally, that the term is still retained.

The characters that distinguish the highest form of truth are generality and certainty or precision; and in proportion as a subject has advanced in these respects, it might be said to have become philosophical, but we now prefer to use the word scientific. The theoretical foundations of a practical subject, as grammar, are sometimes pretentiously called the philosophy of it. So any department of nature or humanity, where explanations by general laws are furnished, is styled "philosophical;" thus, we have the philosophy of zoology or of history, and a "philosophical" naturalist or historian.

Again, after definite branches of knowledge have taken a scientific shape, and have been reckoned as distinct "sciences" (mathematics, etc.) the general principles and views that are supposed to run through the whole, are sometimes called "philosophy." This was one of the meanings of the word in Plato. The great work of Auguste Comte bases its title (*Cours de Philosophie Positive*) upon this consideration.

Prof. Ferrier remarks that philosophy is not truth, but "*reasoned* truth;" that is, it must be truth presented under the forms and processes that evolve and establish the highest or scientific knowledge. This is merely another mode of stating that philosophy implies a special procedure for attaining truth, the ordinary unregulated operations of the understanding being insufficient.

Among the oldest problems of philosophy, we are to reckon the attempt to generalize the universe, or to resolve all nature into some great unity, or common substance or principle. Thales considered water the primordial and fundamental principle. Anaximander adopted as the foundation of the universe something called by him the infinite or indeterminate, out of which the various definite substances, air, fire, water, etc., were generated, and to which they were again resolved. Anaximenes assumed air as the primordial substance, which, by rarefaction, produced fire and ether, and by condensation, water, earth, and stone. These three philosophers all belonged to the Ionic colony of Miletus. Pythagoras was an emigrant from Ionia to Italy; he gave number as the essence and foundation of all existing things; the different numbers being representative of different natural properties and powers; thus, *five* stood for color, *six* for life, etc. Xenophanes of Kolophon attacked the popular polytheism, and propounded one great indivisible agency comprehending and identified with the universe, which he would not designate as finite or infinite, in motion or at rest. Parmenides of Elea distinguished between self-existent being, Ens, or the absolute, characterized by extension and duration, and phenomenal nature, the region of inferior certainty, or mere opinion. This was the first sketch of what has since been called ontology, or the science of the *noumenon*, or absolute being. Herakleitus of Ephesus maintained an absolute of a totally different character—a principle of incessant change, the negation of all substance and stability, a power of perpetual destruction and renovation. Empedocles took his stand upon the four elements, out of which all things were constituted by the action of the opposing principles of love, and enmity or discord—a poetical representation of attrac-

tion and repulsion. Anaxagoras also treated the world as made up of elements, but indefinite in number. By the attraction of each for its own kind, the primitive chaos was separated, but excepting "mind," no element ever was perfectly pure, the character of each substance being determined by the predominance of the proper element. These elements were called the "homœomeries." Diogenes of Apollonia, the last of the series called Ionic philosophers, adopted in a modified form the tenet of Anaximenes, that air was the primordial element. The celebrated atomic theory originated with Leukippus, but is commonly identified with his pupil Democritus of Abdera. The elements of Anaxagoras were acted on by mind, but with Democritus their activity was inherent in themselves from the beginning.

The grand problem of external perception (see PERCEPTION) was agitated at an early period, and has been always reckoned a leading question of philosophy. The first attempt at a solution was an application by Democritus of his atomic hypothesis. He supposed that all things were constantly throwing off images of themselves, which enter the soul through the pores of the organs of sense. He was aware that this left us in a state of uncertainty, as to whether the images corresponded to the otherwise unknown originals.

The many difficulties and uncertainties incident to the search for knowledge, could not but be felt by inquirers generally. There was one sect in particular, more especially impressed by this circumstance, and hence called skeptics, or doubters. They were represented in antiquity by Pyrrho. They dwelt on the absence of any sure criterion of truth, and pointed out that what was considered most certain was not free from objec tions, or counter-arguments.

Philosophical speculation began to take definite shape in the age of Plato and Aristotle, the age of the beginnings of many of the sciences. More especially at this time do we find the distinct enunciation of the philosophy of human life, otherwise called moral and ethical philosophy. The questions concerning the end of life, the pursuit of happiness, and men's duties in various relationships, had been answered by a sort of rule-of-thumb experience, rather than by deep reflection or far-seeing combinations. The distinctions of virtue and vice were determined by political society, and connected more or less with religion. There were tests and maxims of conduct, for the most part merely prudential. The first approach to a moralizing strain is found in the poems of Hesiod. He combines a gloomy view of life with much practical wisdom, enjoining justice, energy, temperance and simplicity of living The "seven wise men," who belonged to the 6th c. B.C., followed in the same course, and uttered a variety of sayings or short maxims, of which the most ordinary subjects were "the uncertainty of human things, the brevity of life, the unhappiness of the poor, the blessing of friendship, the sanctity of an oath, the force of necessity," etc., together with the simple rules of prudence. The most celebrated saying of this age was the Delphian inscription (of uncertain authorship), "Know thyself." The teaching of the Sophists made another stage in the history of moral philosophy. They opened up discussions on virtue, on justice, on the laws, and on happiness; and framed hortatory addresses with a view to moral culture. Socrates then came forward, and instituted a severe logical analysis of the meaning of ethical terms, asking "What is piety? What is impiety? What is the noble? What the base? What is just? What is temperance? What is madness? What is a state? What constitutes the character of a citizen? What is rule over man? What makes one able to rule?" The rigid search after strict definitions of these terms may be said to constitute a philosophical method in ethics, and hence Socrates is called the first moral philosopher. He gave the impulse to Plato, his successor, who in his turn acted upon Aristotle, and also to the opposing sects of the Cynics and the Cyrenaics—the one affecting a hard and ascetic life, and a proud superiority of the individual will to all outward conventions and customs; the other avowing pleasure as the chief good, sitting loose to the irksome duties of the citizen, and in despair of attaining happiness, sliding into apathy. The Stoics and the Epicureans afforded a similar contrast, although differently expressed. The Stoic ideal was a being in whom the natural impulses and desires should be absolutely subjected to highly abstract views of the universe; the Epicurean ideal was a being moving harmoniously according to natural impulses—in short, following nature up to the limits of prudence.

The last phase of ancient philosophy is represented by Neoplatonism (see NEOPLATONISTS), or the Alexandrian school. In the middle ages, speculative philosophy took the form called Scholasticism (see SCHOLASTICS). At the revival of learning, Descartes and Bacon led in opposite directions, the one representing what is called *à priori* philosophizing; the other, *induction* (q.v.). From this time, "philosophy" comes to mean more exclusively the inquiries connected with the mind, as exemplified in the writings of Hobbes, Locke, Leibnitz, Berkeley, Hume, Reid, Kant, etc. The qualified phrase, natural philosophy (in the English sense), was applied to a special department of the outer world, as moral philosophy was used in connection with mind and the discussion of moral duties. The chief points in the history of modern philosophy will be found under the heads of COMMON SENSE; ECLECTICS; ETHICS; GERMAN PHILOSOPHY; METAPHYSICS; PERCEPTION; and in the notices of BERKELEY; COUSIN; FICHTE; HAMILTON; HEGEL; HUME; KANT; LOCKE; REID, etc.

PHILOSOPHY, CONCORD SCHOOL OF. For many years Mr. A. Bronson Alcott had in mind the establishing of a school of philosophy, and in 1842 a philosophical library

was bequeathed to him for this purpose by James Pierpont Greaves, of England. In 1879 arrangement was made for a school, meeting at Concord, a vill. in Middlesex co., Mass.; and its sessions were to last five weeks during mid-summer. The first session was held at Mr. Alcott's old residence, *Orchard House*. The succeeding sessions were held in a building erected for the purpose called *Hillside Chapel*, capable of seating about 140 persons. Here many persons of note delivered lectures; besides Alcott, Emerson, the Rev. W. H. Channing, of England, S. H. Emery, jr., the director of the school, Prof. Wm. T. Harris, Pres. Noah Porter, of Yale coll., Dr. H. K. Jones, Mrs. Julia Ward Howe, and others. The audiences were principally composed of women. The idea of the school was to seek a surer basis for the truths by which we live and advance, and to apply practically to life what it found of good. Hegel, Plato, Shelling, the personality of God, recent thought concerning history, sociology, literature, and art are among the topics discussed. The school suffered a severe loss in the death of Emerson, 1882; and in 1883, owing to the illness of Mr. Alcott and to insufficient attendance, it practically lapsed; but subsequently was revived.

PHILOSOPHY, MORAL. See ETHICS.

PHILOSTRATUS, THE ELDER, of Lemnos, a famous Greek Sophist and rhetorician, was born probably about 170–80 A.D., studied under Proclus at Athens, and finally established himself at Rome, where he became a member of the brilliant and learned circle that gathered round the "philosophic" Julia Domna, wife of Severus. He was alive, according to Suidas, in the time of the emperor Philip (244–49). He is the author of a number of works still extant, and not without value on account of their matter, although the style and arrangement are faulty. Among them are a life of Apollonius (q.v.) of Tyana, a description of a collection of paintings at Naples under the title of *Imagines*, biographies of a number of sophists, *Heroica*, Letters, etc. There are complete editions of his works by Morel (Paris, 1608); Olearius (Leip. 1709); and Kayser (Zur. 1844, *et seq.*), of which the last is by far the most correct and critical.

PHILOXENUS, B.C. 435–380; b. in the island of Cythera; d. Ephesus: the last of the dithyrambic poets of Greece. When his birthplace was conquered by the Athenians, B.C. 435, P. was sold as a slave, passed into the hands of the dithyrambic poet Melanippides, and afterwards resided at the court of Dionysius, in Syracuse. He is said to have composed 24 dithyrambs and a lyric poem; but although some of these had great popularity, only insignificant fragments have survived.

PHIL'TER, PHILTRE (Gr. *philtron*, love-charm, love-potion). A superstitious belief in the efficacy of certain artificial means of inspiring and securing love, seems to have been generally prevalent from very early times; and among the Greeks and Romans (among the latter in the later days of the republic, and under the emperors), love-charms, and especially love-potions, were in continual use. It is not certainly known of what these love-potions were composed—nor can we rely entirely on the details given us on this subject by classic writers, and their commentators in later time—but there is no doubt that certain poisonous or deleterious herbs and drugs were among their chief ingredients, to which other substances, animal as well as vegetable, are said to have been added, coupled with the employment of magic rites. Thessaly had the credit of producing the most potent herbs, and her people were notorious as the most skillful practicers of magic arts, whence the well-known "Thessaly philtra" of Juvenal (vi. 610). These potions were violent and dangerous in operation, and their use resulted often in the weakening of the mental powers, madness, and death, instead of the purpose for which they were intended. Lucretius is said to have been driven mad by a love-potion, and to have died by his own hand in consequence—though the story does not perhaps rest on sufficient authority; and the madness of the emperor Caligula was attributed by some persons to love-potions given him by his wife Cæsonia—by which also she is said to have preserved his attachment till the end of his life. In the corrupt and licentious days of the Roman empire, the manufacture of love-charms of all kinds seems to have been carried on as a regular trade; the purchasers, if not the makers of them, being chiefly women. The use of philters seems to have been not unknown during the middle ages; and in the east, the nurse of superstition of all kinds, belief in the power of love-potions lingers probably down to the present day.

PHIPS, OR PHIPPS, Sir WILLIAM, 1651–95, b. Maine, removed to Boston in 1673. He was one of 21 sons, and 26 children by the same parents; was at first a shepherd, and then a ship-carpenter's apprentice, and did not learn to read and write till after he went to Boston. In 1684 he visited England, and secured from the British admiralty a ship, with which he attempted to recover the treasure of a Spanish vessel sunk near the Bahamas. His first attempt was unsuccessful; but on a second voyage at the expense of the duke of Albemarle, he recovered $1,500,000 worth of treasure. He received $80,000 worth himself, was knighted, and appointed high sheriff of New England. In 1690 he commanded the expedition which captured Port Royal, and the unsuccessful expedition against Quebec. Through the influence of the Massachusetts agent in England, Increase Mather, to whose father's church he belonged, he was made capt.-gen. and governor of the colony in 1692. He was a zealous Puritan, and assisted his pastor, Cotton Mather, in suppressing witchcraft, but his last official act was to pardon all persons accused or convicted of witchcraft. He died in England, where he had been summoned on account of some accusations against him.

PHLEBENTERISM is a term invented by De Quatrefages to designate an anatomical arrangement, existing, as he supposed, in certain of the nudibranchiate mollusks, and characterized by ramified prolongations of the digestive tube, in virtue of which the digestive apparatus, to a certain extent, supplies the place of a complete circulatory apparatus, and aids in the process of respiration. The researches of Alder and Hancock, and other zoologists, seem, however, to show that in these animals the circulation is as complete as in the gasteropodous mollusks generally, and that these ramified prolongations are of the nature of a rudimentary liver. For further information on this subject, the reader is referred to De Quatrefages's *Rambles of a Naturalist*, vol. i. pp. 348–353.

PHLEBI'TIS, or INFLAMMATION OF THE VEINS (Gr. *phlebs*, a vein), although seldom an original or *idiopathic* disease, is a frequent sequence of wounds, in which case it is termed *traumatic* phlebitis (from the Greek *trauma*, a wound), and is not uncommon after delivery. The disease is indicated by great tenderness and pain along the course of the affected vessel, which feels like a hard knotted cord, and rolls under the fingers. The hardness is, however, sometimes obscured by the swelling of the limb beyond and about the seat of the disorder, partly in consequence of the effusion of serum caused by the obstruction to the return to the venous blood (which thus gives rise to a local dropsy), and partly in consequence of the propagation of the inflammation to the surrounding tissues. The inner surface of the inflamed vessel is supposed to throw out fibrinous fluid, which coagulates in layers, and finally closes the tube. If the vessel is small, the consequences of its obstruction may be of little importance, but when a large vein is affected, the consequences are always dangerous, and may be fatal.

There are two modes of recovery: solution of the coagulated fibrine may take place, and the vessel may again become pervious; or, as is more commonly the case, the obstruction may continue, but a collateral venus circulation may be established, and the circulation thus carried on through a circuitous route. With the return of the circulation—in whichever of these two ways it is accomplished—the swelling subsides, and the patient gradually recovers. If, however, the disease advances, suppuration takes place within the coagulum, and one of two things happens; either abscesses are formed along the vein, or the pus gets into the current of blood and contaminates the circulation, giving rise to the perilous disease known as *pyæmia* (q.v.). Either condition is dangerous; the latter pre-eminently so.

Phlebitis generally originates in some local injury of a vein, and the inflammation, when once established, is readily propagated along the course of the vessel. Sometimes very slight injuries give rise to it. It occasionally occurs after venesection, especially with a dull lancet, or one soiled by contact with diseased matter. Women are peculiarly liable to this disease after delivery, as the veins of the womb are apt to become inflamed, and to communicate the inflammation to the venous trunks connected with them. See PHLEGMASIA.

PHLEB'OLITES (Gr. *phlebs*, a vein, and *lithos*, a stone) are calcareous concretions formed by the degeneration of coagulations in veins, or occasionally originating in the coats of the vessel. They are seldom detected till after death, although cases are on record in which, occurring in subcutaneous veins, they have given rise to external tumors of considerable size.

PHLEBOT'OMY. See BLEEDING.

PHLE'GÉTHON, i.e., the Flaming, a river of the infernal regions, whose waves rolled torrents of fire. Nothing would grow on its scorched and desolate shores. After a course contrary to the Cocytus (q.v.), it discharged itself, like the latter stream, into the lake of Acheron.

PHLEGMA'SIA, AL'BA DO'LENS, or MILK-LEG, is a disease which is most common in women after parturition, especially if they have lost much blood, but sometimes occurrs in unmarried women, and occasionally in males. It usually commences about a week or ten days after delivery with a feeling of pain in the loins or lower part of the abdomen, whence it extends to the groin and down the thigh and leg. The pain soon becomes very severe; and principally follows the course of the internal cutaneous and crural nerve of the thigh and of the posterior tibial in the leg. The limb soon begins to swell, and in the course of a couple of days is sometimes twice its ordinary size, and as the swelling develops itself, the acuteness of the pain considerably diminishes. The limb is partly flexed, and lies motionless; any movement aggravates the pain. The swelling extends uniformly over the limb, which is pale and shining, and hot and firm to the touch, seldom pitting on pressure. The femoral vein may usully be felt like a hard cord, and this symptom, taken with the swelling, clearly indicates that this affection is essentially *crural phlebitis*. The uniformity of the cord is interrupted by nodules, arising either from inflamed cellular tissue, or from clots within the vein. Both legs are seldom attacked at the same time, and the left thigh is the most common seat of the disease.

This affection usually terminates favorably, the acute symptoms disappearing in about ten days or a fortnight. The swelling, however, often continues for a long time, and sometimes lasts for life. Very different opinions have been held regarding the nature of this disease. At one time it was considered as the result of metastatic secretion of milk (or, in other words, as due to the milk leaving the breast, and settling in the thigh, and

hence the term *milk-leg*. There is now no doubt that the disease is inflammation originating in the veins of the womb, and extending to those of the lower extremity. The treatment is the same as for phlebitis (q.v.) generally. Warm poppy fomentations, or bran poultices sprinkled with laudanum, may be applied externally at the beginning of the attack, after which flannel saturated with a liniment, composed of one part of laudanum to two parts of soap liniment, may be applied round the limb in the form of a bandage, applied not so tightly as to occasion pain. If necessary, the bowels must be gently opened with castor oil, and opium given to allay pain and induce sleep.

PHLE'UM. See TIMOTHY GRASS.

PHLOGIS'TON (Gr. *combustible*) was the term employed by Stahl, professor at Halle, in his *Zymotechnia Fundamentalis*, 1697, to designate a hypothetical element which by combining with a body rendered it combustible, and which occasioned combustion by its disengagement, there being left after its evolution either an acid or an earth. In the above-named work he maintains that the processes of obtaining sulphur from sulphuric acid, and of procuring the metals from their earths or *calces*, are analogous, and consist alike in the addition of his phlogiston. Thus sulphur, according to the phlogistic theory—which held undivided sway in chemistry until the time of Lavoisier, who substituted for it the theory of oxygenation (1775–81), and was maintained by a few chemists, especially Priestley, till the beginning of the present century—was composed of sulphuric acid and phlogiston; lead, of the *calx* of lead and phlogiston, etc. In consequence of the general adoption of the phlogistic theory, when Priestley, in 1774, discovered oxygen, and when Scheele a little later discovered chlorine, the names these chemists gave to their discoveries were *dephlogisticated air* and *dephlogisticated marine acid*. According to modern views, mainly based on Lavoisier's experiments, the *addition* of oxygen takes place in the formation of acids and of earths, instead of the *subtraction* of phlogiston. The question whether the process was, in fact, one of addition or subtraction, was finally decided by the balance, an instrument to which chemistry owes most of its marvelous progress during the last three-quarters of a century.

PHLOX, a genus of plants of the natural order *polemoniaceæ*, distinguished by a prismatic calyx, salver-shaped corolla, and unequal filaments. The species are pretty numerous, mostly perennial plants with simple leaves, and mostly natives of North America. A number of species are common in our flower-gardens. This has of late become a favorite genus with florists, and many very fine varieties have been produced.

PHO'BEROS, a genus of trees of the natural order *flacourtiaceæ* or *bixaceæ*, of which one species, *P. mundtii*, the *klipdoorn* of the Dutch colonists of South Africa, although only 20 to 30 ft. high, attains a diameter of 3 ft. or more, and is very useful for the purposes of wagon-makers and house-carpenters, the wood being hard and fine-grained; another South African species, *P. ecklonii*, the *roodpeer* of the colonists, has a hard, heavy, and fine-grained wood, used by cabinet-makers, mill-wrights, etc.

PHOCÆA, a t. in Asia Minor, s.w. of Cyma, founded by colonists from Phocis, and afterward included in the Ionian confederacy. It was one of the principal Asiatic ports, but lost much of its importance under the Persians, who captured it in the time of Cyrus. A portion of the inhabitants then sailed for Corsica, where they founded a colony called Alalia. The Phocæans were the founders of Massilia and other ports on the Mediterranean.

PHOCÆ'NA. See PORPOISE.

PHO'CAS, emperor of Constantinople (602–10), was a Cappadocian by birth, and was for some time groom to Priscus, one of the celebrated generals of the emperor Mauricius (q.v.). His brutal courage gained him a great reputation among the soldiers, and though only a centurion at the time of the revolt against Mauricius, he was elevated to the throne by the soldiers. To secure himself, he caused Mauricius to be murdered, along with his five sons and his principal adherents; and then, by a treaty disgraceful to the empire, got rid of the Avars. But his troubles were just commencing, for Khusru II. (q.v.), shah of Persia, hearing of the death of his friend and benefactor, Mauricius, an event which freed him from the obligation of amity with the eastern empire, took up arms to revenge his friend's murder, and to recover for Persia all the territories previously under her sway. The war was fiercely carried on for 24 years, during the first 18 of which the Persian army was uniformly successful, and the Byzantines were almost completely driven out of Asia. See KHUSRU II. and HERACLIUS. Phocas remained in the capital to overawe his turbulent subjects, conscious of his unfitness to command the army; and abandoned himself to his animal appetites, tyrannizing over the people without the least regard to justice, and putting to death whomsoever he thought dangerous, among others Narses, the celebrated general in the former Persian war. Constantina, the widow of Mauricius, excited against the tyrant two formidable insurrections, the latter in 607, but both were speedily quelled, and the ex-empress with her daughters were beheaded on the same spot where her husband and sons had been slain. Her principal adherents, some of whom were among the highest officers of state, suffered death under the most horrible tortures. These cruelties and the successes of the Persians had well nigh ruined Phocas's power and influence. But he gave the *coup de grâce* to it himself

by insulting his favorite and son-in-law, Crispus, who had remonstrated with him on his conduct. Crispus revenged himself by forming a conspiracy against him, along with Heraclius, exarch of Africa, the result of which was the overthrow of the tyrant, who was taken prisoner (Oct. 3, 610). After being insulted and tortured he was beheaded, and his body dragged through the streets by the mob.

PHO'CIDÆ. See SEAL.

PHO'CION (Gr. *Phokiôn*), an Athenian general of noble character, was b. about the end of the 5th century B.C. Clinton, in his *Fasti Hellenici*, gives the date 402 B.C. He was of humble origin, but appears to have enjoyed a superior education, and to have studied under Plato, Xenocrates, and perhaps Diogenes also, from the last of whom he may have acquired his habit of indulging in caustic sarcasm. Phocion first attracted notice in the great sea-fight at Naxos (376), where he commanded a division of the Athenian fleet, and materially helped to secure the victory for his countrymen. Strange to say, however, we scarcely hear of him again for more than 20 years; but in 351, along with Evagoras, he undertook the conquest of Cyprus for the Persian monarch, Artaxerxes III. (Ochus), and was completely successful. About the same time, but the exact date is uncertain, he led an Athenian expedition into the island of Eubœa, where Philip of Macedon was intriguing, and inflicted a severe defeat on that powerful sovereign at Tamynæ. In 341 he was again successful in crushing the Macedonian party in Eubœa, and in restoring the ascendency of Athens. Two years before this he had achieved a similar result at Megara; and in 340, when sent to the aid of the Byzantines against Philip, he acted with so much prudence and tact, and inspired the citizens with so much zeal and courage, that Philip was forced to abandon the siege, and even to evacuate the Chersonesus, while Phocion captured several of his ships and coast-garrisons, besides making havoc of a good deal of the Macedonian territory. Nevertheless, with just appreciation of the real weakness of Greece proper, and of the strength of Macedon, he advocated, even in the midst of his triumphs, pacific views and the establishment of better relations with the enemy. His advice was not taken; but the fatal battle of Chæronea, only two years afterward, in which the independence of the Greek republics was lost forever, proved its soundness. The murder of Philip, in 336, occasioned the greatest exultation, and Demosthenes even proposed a public sacrifice of thanksgiving and the establishment of religious honors to the memory of the assassin, but Phocion resisted and prevented so monstrous a proposal. Henceforth his career is chiefly political. We see him struggling at Athens to repress what appeared to him the reckless desire for war on the part of the fanatical patriots, on account of which he was regarded as a traitor, but his personal honor is above suspicion. After the death of Alexander in 323, the aged Phocion endeavored, but in vain, to hinder the Athenians from going to war with Antipater. The battle of Cranon, next year, which prostrated his countrymen, again evinced the wisdom of his counsels; but though very unhandsomely treated by the Athenians, he used all his influence with the conqueror (who like Alexander had a profound respect for him) to mitigate their hardships. After the death of Antipater, Phocion was involved in the intrigues of Cassander, the rival of Polysperchon, and was forced to flee to Phocis, where Polysperchon delivered him up to the Athenians. He was condemned by "a mixed mob of disfranchised citizens, foreigners, and slaves" to drink hemlock (317 B.C.). His body, flung unburied over the borders of the state, was carried by some of his friends to Eleusis and burned there. The Athenians soon began to raise monuments to his memory. His life has been written by Plutarch and Cornelius Nepos.

PHO'CIS (Gr. *Phôkis*), a province of Greece proper or Hellas, bounded on the w. by the Ozolian Lokri, on the n. by Doris, on the e. by the Opuntian Lokri, and on the s. by the gulf of Corinth. It was about 792 sq.m. in extent. The greater part of the country is occupied by the famous mountain-range of Parnassus (q.v.). The principal river is the Cephissus. According to tradition, the most ancient inhabitants were the Leleges, Pelasgians, and Thracians, from the gradual mixture of whom the Phocians were believed to have arisen. These were finally united into a free federal state, which derives its chief historical importance from possessing the famous oracle of Delphi (q.v.). During the Peloponnesian war the Phocians were close allies of the Athenians. In the time of Philip of Macedon they were involved in a ten years' war, on account of their opposition to a degree of the Amphictyonic council concerning the use of a piece of land belonging to the temple of Delphi. This war, commonly known as the sacred or Phocian war, ended disastrously for the Phocians.

PHŒBE-BIRD. See PEWEE.

PHŒ'BUS (i.e., the bright or radiant), a title, and subsequently a name of Apollo. It had reference both to the youthful beauty of the god and to the radiance of the sun, when latterly Apollo became identified with Helios, the sun-god.

PHŒNICIA. See PHENICIA.

PHŒNICOP'TERUS. See FLAMINGO.

PHŒNIX, bird. See PHENIX.

PHŒNIX. See DATE PALM and PALMS.

PHŒNIXVILLE, a borough of Schuylkill township, Chester co., Penn., at the junction of French creek and the Schuylkill river, 23 m. n.w. of Philadelphia and 30 m. s.e. of Reading ; a station on the Philadelphia and Reading, and the Pickering Valley railroads ; pop. in 1890, 8514. The Phœnix iron works are said to be the largest in the United States. There are newspapers, banks, a seminary, and many churches and schools, and manufactures of copper, cotton, and wood.

PHO'LAS, a genus of lamellibranchiate mollusks, of the family *pholadidæ*. This family, to which the ship-worm (*teredo navalis*) also belongs, has the shell gaping at both ends, thin, white, very hard, sometimes with accessory valves; the two principal valves beset with calcareous inequalities, connected by fine transverse parallel ridges, forming a kind of rasp, used by the animal for boring a hole in rock, wood, or other substance, in which it lives. The animal itself is either club-shaped (as in *pholas*) or worm-shaped (as in *teredo*), with large long siphons, often united almost to the end, and a short foot. Several species are natives of the British coasts. They are popularly called *piddocks*. They are used for bait, and also for food. How the pholades or pittocks excavate the holes in which they live, sometimes in clay or mud, but often in chalk, and even in much harder rocks, has been the subject of much dispute. An excavating instrument armed with siliceous particles, has been ascribed to the animal, but no such instrument exists. The shell is studded with projections, in regular rows, giving it the character of a rasp or file; and the pholas fixing itself firmly by its foot, which acts as a sucker, and working itself from side to side, makes use of the rasping power of its shell to enlarge its hole as it has need, so that the hole is always very exactly accommodated to the size of the occupant.

PHONAUTOGRAPH. See Sound, Recording of,

PHONET'IC WRITING is the representation of speech by means of symbols for the elementary sounds of language. All alphabetic writing is essentially phonetic. The invention of letters was the invention of phonetic writing, as distinguished from the older pictorial, or ideographic, writing. From a variety of causes, however, no language has ever been perfectly represented by its spelling, and with the lapse of time the divergence has gone on increasing, since the spoken words are constantly undergoing change, while the spelling tends to remain fixed. In English, more especially, this divergence has been allowed to proceed to such an extreme that it is admitted on all hands to be a serious evil, and in recent times various schemes have been projected to remedy it. It is to these schemes of radically reformed spelling that the name of phonetic writing is now more especially applied; and what follows, represents the views and arguments of the promoters of the movement, and sketches its history.

The earliest attempts at alphabetic writing were as strictly phonetic as the limited scheme of symbols allowed, or as the limited aim of writers required. The alphabets were confined almost exclusively to consonants; and the analysis of speech on which they were based was of course confined to the languages for which the alphabets were designed. When any old alphabet, therefore, came to be adopted for a new language or dialect, it would be found deficient in the means of writing any sounds which were not used in the language for which the alphabet was originally intended. Unless, then, new symbols were added for the new sounds, these latter must have been represented by conventional combinations of letters; and at this point the writing would cease to be perfectly phonetic.

The Sanskrit language furnishes the most convincing proof of the original phonetic character of alphabetic writing; for not only were words written exactly as they were sounded, but every change which a word underwent in utterance was consistently indicated by a change in the writing. Notwithstanding this fact, there is no language in which the etymological and grammatical relations of words are more clearly exhibited or easily traced than in Sanskrit. Our own language illustrates the same principle. No difficulty is experienced in discovering the relation between *loaf* and *loaves*, *wife* and *wives*, notwithstanding the change of *f* into *v* in the plural; nor would any difficulty be created though the *s* also were changed, as it is in sound, and the words written as they are pronounced—lōvz ,wīvz.

The English language embraces in its dialects almost all the elementary sounds of all languages; and the Latin alphabet, which was adopted for its writing, was so insufficient in the number of its characters, that many new letters would have been required to adopt it for the representation of Anglo-Saxon and other words. But, in place of being extended, the alphabet was reverentially accepted with all its imperfections; its deficiencies were supplemented by the use of servile or silent letters, and by various orthographical expedients; and thus our writing came to be irregular, difficult, and fluctuating. The great inconvenience, however, of representing by the same character the sounds of U and V led to the introduction of the former as a new letter for the vowel sound, and to the limitation of the latter character to the consonant sound; and the further ambiguity arising from the want of an appropriate sign for the sound of W led to the invention of that symbol, which, being formed by joining together two of the old V characters, was thence called "double V"—pronounced, according to the old sound of V, "double U." The phonetic principle was fully recognized in these changes, and they furnish precedent for further changes, when a necessity for them shall be sufficiently felt and acknowledged.

There can be no doubt that phonetic writing would greatly facilitate the acquisition of the power of reading, and consequently of the education of children and illiterate adults, as well as tend to the reduction of dialects to one common standard, and further the diffusion of our language in foreign countries. To learn to read from perfectly phonetic characters would be merely to learn the alphabet, and to spell would be merely to analyze pronunciation. A child at school might be made a fluent reader in a few weeks. All uncertainty of pronunciation would vanish at the sight of a word, and dictionaries of pronunciation would be superfluous.

Of all the languages which employ the Latin alphabet, the English is the worst represented; in some measure because of the rich variety of its phonic elements, but chiefly because, of all the nations which have adopted Latin letters, the English have done least to make their writing phonetic. Every attempt to correct the anomalies of our orthography has roused a host of prejudices, against which the efforts of private individuals have been powerless. The difference between phoneticians and their opponents seems to be a fundamental difference as to what really constitutes a word. The former, maintaining the *sound* to be the true word, would discard all associations dependent on letters, in order to represent the exact sound in the simplest manner; the latter, clinging to the literal associations of orthography, argue as if the verbal cluster of *letters* in reality constituted the word. The dispute is thus, in effect, between letters and sounds; which are the signs—which the thing signified?

In phonetic writing, the eye would no doubt confound such words as *know* and *no*, *see* and *sea*, *sighs* and *size*, when written separately, as in a vocabulary; but it cannot be supposed that such words would present more ambiguity in contextual usage than they now do in utterance, subject to the same confusion to the ear. At present we have, in fact, two languages—one purely phonic, addressed to the ear; and the other, in some degree etymological or historical, addressed to the eye. In this respect, we are in a similar position to the Chinese, with their classical ideographic language of literature, and their multitudinous vernacular dialects. In order to establish the assertion, that the phonic word (the sound) written phonetically in a sentence would be less intelligible to the eye than the written word in its present form, it is incumbent on the opponents of phoneticism to show that the simple phonic word is now less intelligible when pronounced in a sentence, than its written symbol is when read in a sentence.

The principal objection urged against phonetic writing is, that it would obscure the etymological history now discoverable in the orthography of a word. The best answer to this objection is that the traces of etymology, preserved in the present spelling, are so imperfect and inconsistent as to be of little value compared with the embarrassments they occasion in other respects.

The first requisite for the construction of a phonetic alphabet is an exact knowledge of elementary sounds, that every element may be provided with its appropriate symbol, and that no more symbols may be introduced than there are distinct elementary sounds. The latter consideration would be of importance only in connection with a general alphabet available for all languages. An alphabet for any individual language might contain symbols for compound sounds, with no other disadvantage than that of adding to the number of symbols. It would not, for instance, be of any consequence, so far as phonetic writing is concerned, whether the word *sacks* were represented by the letters *saks*, *sacs*, or *sax*, so that the symbols used were invariably appropriated to the same sounds. Orthoepists and phoneticians are not agreed as to what elements compose many of our compound sounds, such as those heard in the words *chair*, *queen*, *tune*, *I*, *out*, etc. Any attempt, therefore, at representing compounds analytically would be premature, until the analysis of the compounds had been settled. This analysis would be absolutely necessary for a general alphabet, but not so for an alphabet for any single language. Phonetic writing, then, should be separately considered, as a means of representing the elementary sounds of all languages, and as a method of symbolizing the pronunciation of any one language only. We shall now show the nature of the attempts that have been made for the phonetic writing of English.

Dr. Franklin, in 1768, proposed a phonetic alphabet for English, in which new symbols were introduced for the vowels heard in the words *on* and *up*, and the four consonants heard in the words *she*, *they*, and *thing*. Many other schemes have been from time to time proposed; but the only alphabets which have been practically applied on a large scale are those of Dr. Comstock in America, and Messrs. Ellis and Pitman in England. The object of experimenters in this department has generally been to make use of existing letters as far as possible, and only to supplement deficiencies by new forms. The common alphabet has been made to furnish almost a sufficient number of characters by the inversion of some of its letters—thus, ʌ, Ʌ, ɐ, ɔ, ɘ, ƨ, ɥ, etc., as in the "anti-absurd" alphabet of Maj. Beniowski; but the best scheme of phonotypes that has yet been introduced was the joint production of Mr. Isaac Pitman, the inventor of the first system of phonetic shorthand writing, and Mr. A. J. Ellis, B.A. of Cambridge, a most accomplished mathematician and linguist. This alphabet was completed in 1847; and the experiment of its introduction was carried out with great diligence and perseverance by its promoters, until an army of philanthropic assistants became enlisted in all parts of Great Britain and America. Primers and school-books were issued, and tested on juvenile and adult classes; many works of standard literature, and even the entire Bible,

were translated into the new spelling; magazines were published, and ultimately a newspaper, printed in the phonetic character, was started by the enterprising orthographic reformers. In this scheme of phonotypes, dipthongal and articulate compounds were not analyzed, and the letters of the ordinary alphabet were retained in their most common signification, 17 new characters being introduced for unrepresented or ambiguously written sounds. The forms of these were, in most cases, happily suggestive of the displaced orthography, and the general aspect of the writing bore such a resemblance to common typography, that any good reader of the latter could decipher the new printing with ease, after a very brief study of the alphabet. The ordinary vowel letters (A, E, I, O, U) were pronounced as in the words *am, ell, ill, on, up;* the consonants C and G were sounded as in *came* and *game;* the letters K, Q, X were rejected as superfluous, and all the other letters of the common alphabet were retained, with their established sounds. Comparing this scheme of letters with the tabulated elementary sounds of English, we find that it represents all the vowels, except the nice varieties heard in the words *air, ore, err, ask;* and that all the consonants are accurately represented except *wh.* The latter element is written by letters sounding *hoo,* so that the words *where* and *whoe'er* are made identical to the eye; and the sentence, "I saw the man *whet* the knife," is written, "I saw the man *who ate* the knife."

Notwithstanding these imperfections, this alphabet was found to work well among those who were disposed for a reform. The phonetic method was proved to be remarkably simple and easy in comparison with the ordinary system; the time occupied in making fluent readers was greatly reduced; and readers of phonetic printing experienced but little difficulty in the transition to reading from common orthography.

The advantages claimed for the system were chiefly: rapidity of learning to read, certainty of pronunciation, and increased facility in common reading, after the power of phonetic reading had been acquired. The chief disadvantages alleged against the system were: accustoming the eye to a false orthography, and teaching what had to be in great part unlearned after it was acquired. Whether the objectors were right or wrong, they were overpoweringly numerous, and the system failed to do more than prove that phonetic spelling greatly simplifies the acquisition of the power of reading.

The original phonotypic alphabet, described above, has been for some years discarded in the printing issued from the "phonetic institution" (Bath), and a more analytic alphabet has been adopted, in which *eleven,* instead of seventeen, new forms are introduced. The latest edition of this alphabet gives the ordinary vowel letters A, E, I, O for the sounds in the words *am, ell, ill, on,* and the letter U for the sound in *pull;* K is restored, and C rejected; J is used as in French; and the elementary sound of *wh* is still unacknowledged. The 11 new characters represent the consonants in the words *she, oath, they,* and (s)*ing;* and the vowels in the words *ale, eel, alms, old, all, pool, up.*

The following are the forms of the new letters as printed and written, with a passage exhibiting their appearance in composition:

VOWELS.

A a	E e	I i	—	O o	U u	—	ɔ ɜ
A ɐ	Ɛ ɛ	Ɪ i	—	Ɔ ɔ,	Ʊ ʊ,	Ɯ ɯ	— ɔ ɜ.
alms,	age, air,	eat	—	all,	ope,	food	— son, but.
ɑmz,	edj, er,	it	—	ɔl,	ɔp,	fud	— sɜn, bɜt

DIPHTHONGS.

ɑi,	ei,	ɔi,	ou.
ai	ei	ɔi	au
ay,	by,	boy,	now.
ɑi,	bei,	bɔi,	nou.

CONSONANTS.

C ç,	Ħ ð,	Ʒ ʒ,	Ŋ ŋ.				
Ʃ ʃ	Ħ θ	Ʒ ʒ	Y y				
she,	thin,	then,	sing.				
çi,	θin,	ðen,	siŋ.				

The double letter *u,* as in *unit, unite, duty, value,* is written thus: "yunit, yuneit, diuti, valiu." When *ai, ɔi,* make a *dissyllabic* diphthong, the second letter is marked with a diæresis; thus, *solfaïy, soïy.*

"'Tiz ðe meind ðat meks ðe bodi ritç;
and az ðe sɜn breks θru ðe darkest kloudz,
sɔ onor 'pireθ in ðe minest habit.
Hwot! iz ðe dje mɔr preçɜs ðan ðe lark,
bikoz hiz feðerz ar mɔr biutiful;
or iz ðe ader beter ðan ðe il,
bikoz hiz pented skin kontents ðe ei.
O nɔ, gud Kɜt; neiðer art dou ðe wɜrs
for ðis pur fɜrnitiur and min erz."

This phonetic alphabet consists of 34 letters, viz., the 23 useful letters of the common alphabet (*c, q,* and *x* being rejected), and 11 new ones below, *J* is used for the French j

(zh), or *g* in "edge," or *s* in "vision;" hence *dj* represents *J* in *John*, and *dg* in *edge*. *Tç* (*t sh*) represents *ch* in *chess*, and *tch* in *catch*. *Y* and *w* are consonants; *wh* being replaced by *hw*. The vowels *a, e, i, o, u* have invariably the short sounds heard in *pat, pet, pit, pot, put*. All the other old letters have their usual signification. The italic letters in the words in the third line denote the SOUNDS of the letters.

The reduction in the number of letters from that in the Ellis and Pitman alphabet is obtained chiefly at the expense of the phonetic *principle*, in the attempt to analyze diphthongs in writing, before their correct phonic analysis has been ascertained and settled. A method has been proposed by Mr. Bell, in which the advantages of phoneticism might be secured, so far as simplifying the acquisition of reading is concerned, without alphabetic change. Thus the orthography and sound are shown together when the words *loaf, debt, wife, wreath, straight*, etc., are printed lo^{e}f, de^{b}t, wif^{e}, wre^{a}th, stra^{i}g^{h}t, etc.

The chief difficulty in the construction of a universal alphabet has arisen from the want of a complete classification of elementary sounds; another difficulty has been created by an adherence to the inadequate letters of the Roman alphabet. Symbols must be devised which would indicate to the eye all the organic relations discoverable by the ear between the various elements, and which would be free from the associations that would attach to adopted letters familiar to the eye with other meanings. This principle has been carried out on the system of *visible speech* (q.v.) by Mr. Melville Bell. For phonetic short-hand writing, see SHORT-HAND. See also SPELLING REFORM.

PHONOGRAPH. So far as we have authentic record, the first mechanical device for the registering and subsequent reproduction of speech or other sound was the invention of one Leon Scott, and made in 1857. This consisted simply of an ellipsoidal barrel, which was the sound receiver, and which was open at one end and closed at the other. From the closed end projected a small tube, across which was stretched a flexible membrane. To the center of this membrane, by means of sealing wax, was affixed a bristle, which acted as a stylus, and which shared the vibrations of the membrane. In front of the membrane was placed a horizontal cylinder, about which was wrapped a sheet of paper, covered with a thin layer of lamp-black. Against this prepared cylinder the bristle rested lightly. Any sound vibrations entering the ellipsoid were transmitted through the membrane to the stylus, which, when the cylinder was made to revolve, and to slowly advance in revolving, described on the lamp-black surface a zigzag line which was thus practically a phonographic score of whatever noise had been produced.

The invention of Leon Scott embodies the essential principles on which recording and reproducing instruments of the present day are based. If now we substitute a receiving funnel for the ellipsoid, a more rigid or metal stylus for the bristle, and a tin-foil covered cylinder for the lamp-black one, we have the phonograph of Thomas A. Edison, which created such a sensation at the time of its invention in 1877; with this essential difference, however, that the sound vibrations were now *indented* instead of being traced. By reversing the machine—that is, causing a blunt stylus to travel over the indentations made, the original sound was reproduced. Great expectations were entertained, commercially and otherwise, of this invention at the time; but it was found that after a few repetitions the record became effaced from the tin-foil, and the invention proved to be scarcely more than an interesting toy.

During the year 1888 Mr. Thomas A. Edison placed upon the market a phonograph which was (see illustration) a far more elaborate machine than any of its predecessors. The tin-foil now gives place to a wax cylinder, which, as shown in the illustration, is slipped over and held on a mandrel. In the illustration two disks are shown: one for recording and the other for reproducing; and either is quickly brought into use. In operating, the wax cylinder is made to revolve. In talking into the funnel, the malleable glass diaphragm, with a cutting stylus on its under surface, is made to vibrate, and a register of the sound is thus cut vertically into the wax, the cutting stylus advancing horizontally as the cylinder revolves. In reproducing, the other diaphragm, which is made of bolting silk thinly coated with shellac, is used; the needle or stylus being attached to its under center. This stylus follows the track cut out by the recording stylus. Its motion causes the diaphragm to vibrate, and to thus reproduce the original sound. The machine gets its power from a small electric-motor. It must not be presumed that the sound thus reproduced is equal in volume to the original. In fact, many, on hearing it for the first time, are disappointed in this respect. By means of tubes inserted in the ears and connected with the reproducer the sounds may, however, be clearly understood, and if a funnel be attached to the reproducer, and the speed of the machine properly increased, the sounds may be given out with sufficient loudness to be heard by all in a room. In using a cylinder that already contains a phonographic record, a sharp knife precedes the cutting stylus, thus removing the previous record. A record once made can be reproduced several thousand times without perceptible impairment of its quality, and a record made on one machine can be reproduced on another, thus admitting of the cylinder's being used for mailing, as in ordinary correspondence. Although the phonograph and graphophone are used to a considerable extent for entertainment purposes they have failed to take the place of stenographers, as was at first expected, to any great extent.

In 1891 Mr. Edison made a novel combination of the phonograph with the photographic camera. An arrangement of the latter in a new way to do a new work, the inventor calls the KINETOGRAPH, which does for the eye what the phonograph does for the ear. The kinetograph, or "motion-recorder," is a camera containing a roll of gel-

THE PHONOGRAPH-GRAPHOPHONE, SHOWING MOTOR ATTACHMENT.

atine film which is unrolled from one spindle to another and, in being unrolled, is made to pass before the lens of the camera. The shutters of the camera are so arranged as to be worked by a shaft attached to the cylinder of the phonograph which is used in combination with the Kinetograph. The mechanism of the camera allows forty-six perfect photographs to be taken in one second. These photographs, enlarged and reproduced upon a screen with the same rapidity, give to the eye the picture of actual motion, while the phonograph gives to the ear the simultaneous utterances of the person or persons whose figures are on the screen. It will thus be possible for the possessor of the Kinetograph not merely to hear an opera, but to see its action transpiring before his eyes.

PHONOGRAPH-GRAPHOPHONE, THE. This machine, the invention of Mr. Charles S. Tainter and Mr. Chichester A. Bell, while much more simple in mechanism, is based upon exactly the same set of principles as Mr. Edison's phonograph. It can be run either by a motor or a treadle. The cylinder, instead of being of wax only, is made of a spirally wound strip of paper, and has a wax surface on which the phonographic record is made, and, instead of being slipped over a mandrel, is held between chucks at either end. No cylinder, however, can receive more than one tracing. Below the cylinder is arranged a pan for receiving the fine shreds of wax which the recording stylus throws off. The number of grooves to the inch is 160. The groove is only three one-thousandths of an inch wide, and less in depth. In this machine the recording and reproducing apparatuses are separate and removable. In the machine as shown, the recording diaphragm is affixed.

In both the inventions of Edison and Tainter, there is no limit to the speed with which sounds can be recorded, nor to the number and variety of sounds. They will accurately record and reproduce a solo, a quartet, or the music of a whole orchestra; the difficulty being the purely mechanical one of concentrating the sounds upon the diaphragm. Even the tone of a voice is reproduced with considerable fidelity. By increasing the speed of the cylinder, the pitch is raised, while by lessening it the pitch is lowered.

PHONOMA'NIA. See Homicidal Mania.

PHOS'GENE GAS, known also as Oxychloride of Carbon or Chlorocarbonic Acid, is represented by the formula $COCl_2$. At ordinary temperatures it is a colorless, suffocating gas, which is formed by exposing equal measures of carbonic oxide and chlorine to the direct action of the sun, when they combine and become condensed into half their volume. It does not possess any acid characters, but water decomposes it into carbonic and hydrochloric acids, as is shown by the equation $COCl_2 + H_2O = CO_2 + 2HCl$. This gas is of great interest in relation to the artificial production of urea (q.v.). It is now made and used on a large scale for the production of several beautiful dye-stuffs.

PHOS'PHATES (in physiology). The following phosphates* play an active part in the chemistry of the animal body.

Phosphate of soda, which may occur under any one of the three forms, Na_3PO_4, or Na_2HPO_4, or NaH_2PO_4. All these salts are soluble in water; and the first two have an alkaline reaction, while the third is acid. By exposure of the second of these salts, Na_2HPO_4, to a red heat, it is converted into what is termed *pyrophosphate of soda,* $Na_4P_2O_7$, in which the phosphoric acid is obviously no longer tribasic, but tetrabasic; and by similarly treating the third of these salts, NaH_2PO_4, we convert it into the so-called *metaphosphate of soda,* $NaPO_3$, in which the phosphoric acid is monobasic. It is in consequence of these changes under the action of heat, that the terms *pyrophosphoric* and *metaphosphoric* have been used as synonyms for *tetrabasic* and *monobasic phosphoric acids.* Phosphate of soda, in one or other of the above forms, occurs as a constituent of all the animal fluids and soft tissues of the body, but is especially abundant in the urine and the bile. There are reasons for believing that it is the second and third of these salts which occur as constituents of the animal body, although the first may possibly sometimes be found. Pyrophosphate and metaphosphate of soda are often found in the ashes of animal fluids or tissues after the process of incineration, but they merely result from the action of heat on the two other salts. The following remarks on the derivation, elimination, and physiological importance of the phosphate of soda, are equally applicable to the corresponding salts of potash, which are always associated with them. The phosphates of the alkalies, which occur in the animal body, obviously owe their origin, either directly or indirectly, to the food; viz., directly, by being ingested as phosphates of the alkalies; or indirectly (within the system), by the action of phosphate of lime on salts of the alkalies. The elimination of these salts from the system is necessary, because they are being constantly supplied by the food; and this process is effected mainly by the kidneys and the intestinal canal. In the carnivorous animals, whose blood is much richer in phosphates than that of herbivora (the ash of the blood of the dog, for example, contains from 12 to 14 per cent. of phosphoric acid, while that of the ox or sheep does not contain more than from 4 to 6), these salts are carried off by the urine; but in consequence of the formation of free acids as products of the disintegration of the tissues, a portion of the base is abstracted from the originally alkaline phosphates, and a corresponding portion of phosphoric acid is liberated. The originally alkaline salt is thus rendered neutral or even acid; and the occurrence of

* The means of distinguishing between the salts of monobasic, tribasic, and tetrabasic phosphoric acid, are given in the article Phosphorus.

the acid phosphate of soda, NaH_2PO_4, in the urine is thus explained. In the herbivorous animals, on the other hand, the urine contains no phosphates, the whole of the phosphoric acid taken in their food being eliminated by the intestinal canal in the form of the insoluble phosphates of lime and magnesia. Although the general distribution of the phosphates of the alkalies in the nutrient fluids (there is forty per cent. of them in the ash of the blood-cells; 28.4 per cent. of phosphoric acid and 23.5 of potash in the ash of cow's milk; and about 70 per cent. of phosphoric acid in the ash of the yelk of egg) is in itself an indication of their importance, the exact nature of their functions is not completely understood. Liebig has specially drawn attention to the peculiar grouping of the acid and alkaline fluids of the animal body. The permanence of this grouping is chiefly maintained, especially in herbivorous animals, by the conversion, within the body, of alkaline and neutral phosphates into acid phosphates by the means already described. Moreover, all tissue-forming substances (the protein bodies) are so closely connected with phosphates, that they remain associated during the solution and subsequent re-precipitation of these substances; and the ash of developed tissues (such as muscle, lung, liver, etc.) always affords evidence that acid phosphates existed in the recent tissue; and, further, no exudation from the blood-vessels can undergo transformation into cells and fibers, or, in other words, become organized, unless, in addition to other condititions, phosphates are also present. Another very convincing proof of the share taken by the phosphates in the formation and functions of the tissue, is the fact that, although herbivorous animals take up a very small quantity of phosphates in their food, and although their blood is very poor in these salts, their tissues contain as large a proportion of phosphates as the corresponding parts of carnivora. Lastly, the fact, that one equivalent of the alkaline phosphate of soda, Na_2HPO_4, possesses the property of absorbing as much carbonic acid as two equivalents of carbonate of soda, leads us to the belief, that the power of attracting carbonic acid, which the serum of the blood possesses, is due at least as much to the phosphate as to the carbonate of soda, and that, consequently, phosphate of soda plays an important part in the respiratory process.

Phosphate of lime occurs in the organism in two forms, viz., as the normal calcium phosphate, $Ca_3(PO_4)_2$, and the monohydrogen calcium phosphate, also called acid phosphate, $CaHPO_4$. The normal phosphate occurs in all the solids and fluids of the body, but is most abundant in the bones, in which it amounts to about 57 per cent.; and in the enamel of the teeth, in which it ranges from 80 to 90 per cent. It may at first sight appear inexplicable how a salt so perfectly insoluble in water as normal phosphate of lime, can be held in solution in the animal fluids. In some fluids, as the blood, it is probably, in part at least, combined with albumen, with which it forms a soluble compound; while in other fluids, as the urine, it is held in solution by a free acid or by certain salts (as, for example, chloride of sodium), whose watery solutions are more or less able to dissolve it. If any proof is wanted of the functions of this salt in relation to the bones, it is afforded by the well-known experiment of Chossat, who showed that when too small a quantity of it is taken with the food, the bones lose more or less of their hardness and firmness, and fractures do not readily unite. Phosphate of lime, like the phosphates of the alkalies, is indispensable to cell-formation; and as a good illustration of this fact, it may be mentioned that in the mantle of the mollusks (where new cells for the formation of shell abound) this salt is far more abundant than in any other part of the body. Although by far the greater quantity of the phosphate of lime found in the body has doubtless pre-existed in the food, yet it is unquestionable, that a part of it is formed within the organism by the action of carbonate of lime on the phosphoric acid that is formed during the disintegration of the phosphorus-containing tissues, such as the brain, for example. In man and carnivorous animals, a certain portion of the phosphate of lime is eliminated by the kidneys, and the rest is carried off in the excrements; while in herbivorous animals the whole is carried off in the excrements. The acid phosphate of lime is occasionally found in the urine of man and carnivorous animals, but is of no practical importance. For a notice of the amount of earthy phosphates daily eliminated by the kidneys, the reader is referred to the article URINE.

Normal Phosphate of Magnesia, $Mg_3(PO_4)_2$, is analogous, both in its chemical and physiological relations, to the corresponding salt of lime, with which it is always associated. The abundance of this salt in the seeds of the cereals, and in the other ordinary articles of vegetable diet, sufficiently explains its presence in the system. A far less amount of this salt than of the corresponding lime-salt seems to be required by the organism, as is shown by the relative quantities in which they occur in bone (57 of the former to 1.3 of the latter), and as is further indicated by the fact that, relatively, far more of this than of the lime-salt escapes intestinal absorption, and appears in the excrements.

The only phosphates remaining to be noticed are the *phosphate of ammonia and magnesia*, or, as it is sometimes termed, the triple phosphate, $Mg(NH_4)PO_4 + 6Aq$, which occurs in beautiful prismatic crystals in alkaline urine, and, indeed, in any specimen of urine that is beginning to putrefy, and the *phosphate of soda and ammonia*, which is occasionally found as a crystalline sediment in putrid urine.

PHOSPHAT'IC DIATH'ESIS, in medicine, designates the condition in which there is a tendency in the urine to deposit *white gravel*. As the deposit of lithates (see LITHIC ACID DIATHESIS) depends upon an excessive acidity of the urine, so that of the phosphates is

determined by the opposite condition—namely, by deficient acidity, or by positive alkalescense. Alkalescence of the urine may occur from two distinct causes—viz. (1) from the presence of the carbonate of a fixed alkali (potash, or soda), or of alkaline phosphate of soda (see PHOSPHATES in physiology); or (2) from the presence of the carbonate of the volatile alkali, ammonia, which is due to the decomposition of urea. This decomposition is due to the fermenting action of the mucus of the bladder on the urea, and is explained

Urea. Water. Carbonate of Ammonia.

by the equation—$\overbrace{CO(NH_2)_2}+\overbrace{2H_2O}=\overbrace{(NH_4)_2CO_3}$.

The white gravel which is deposited in the second of these conditions—viz., when the urine contains carbonate of ammonia, is composed of minute shining prismatic crystals of the triple phosphate of ammonia and magnesia, whose formula is given in the article PHOSPHATES. This salt is formed as follows: Healthy urine contains phosphate of magnesia in a state of solution. If, however, the urine become alkaline from the decomposition of the urea, a portion of the ammonia combines with the phosphate of magnesia, and forms the triple salt which is insoluble in the urine, which has now become alkaline. With this triple phosphate, there is almost always an admixture of phosphate of lime $Ca_3(PO_4)_2$ in the form of an amorphous precipitate. The tendency to deposit the mixed phosphates (triple phosphate and amorphous phosphate of lime) is especially observed in cases of disease or injury of the spinal cord, and in disease of the bladder, particularly in chronic inflammation of its mucous coat. Upon allowing urine of this kind, which is usually pale in color, to stand for some time, an iridescent film or pellicle generally forms upon its surface, which, when examined under the microscope, is found to consist mainly of the salts we have described. Such urine speedily becomes putrid, and evolves a strong ammoniacal odor.

The above is by far the most common form of the phosphatic deposits, but, as has been already stated, the urine may become alkaline from the presence of the carbonate of potash or soda; and then, no ammonia being present, in place of the triple salt, there is a deposition of amorphous phosphate of lime, or in rare cases, of a crystalline stellar phosphate, whose composition, according to Dr. Bence Jones, is represented by $CaHPO_4$ (*Journ. of Chem. Soc.*, vol. 15). In these cases the urine is alkaline, pale, copious, slightly turbid, of low specific gravity, and of a peculiar odor. This urine makes reddened litmus paper *permanently* blue; while ammoniacal urine causes only a temporary change in the color of the same test-paper. As the urine cools, and sometimes even in the bladder, the white sand is deposited, occasionally giving the last portion of the excreted urine a milky appearance. During perfect health, the urine often becomes temporarily alkaline during the act of digestion (when the gastric juice is especially acid); but as a general rule, the tendency to alkalescence from a fixed alkali, and therefore to phosphatic deposits, is associated with general debility. These deposits occur for the most part in sallow, languid, unhealthy-looking persons, whose vital energies have been depressed by mental anxiety, by insufficient food, or by sexual excesses.

In both forms of alkaline urine, and therefore of phosphatic deposits, a generous diet and tonics, such as bark, wine, and the mineral acids (given before meals), are of great service; and opium is usually of great value, if judiciously administered. Small doses of benzoic acid, twice or thrice a day, with the view of restoring the acidity to the urine, and the occasional washing-out of the bladder with tepid injections, have been also found serviceable in the ammoniacal form of the disease.

PHOSPHOR-BRONZE, gun metal with the addition of a small proportion of phosphorus. Gun metal contains about 10 parts of copper to one of tin. The addition of a little over one-half per cent. of phosphorus increases the fluidity when melted of the metal and increases its elasticity and strength on cooling. Trials at Berlin were made with over 400,000 pulls on a bar of phosphor-bronze with a strain of ten tons to the sq. in., without rupture; but an ordinary bar of bronze broke with less than 10 tons strain. In regard to elasticity the following results have been obtained in recent Austrian experiments. Phosphor-bronze, 54.915; Krupp's cast steel as used for guns, 14.450; ordnance bronze, 5.562. The addition of phosphorus also confers upon copper or bronze protection against sea water.

PHOSPHORES'CENCE. Strictly speaking, the term is applied to the phenomenon, exhibited by certain bodies, of remaining luminous in the dark for some time after being exposed to a strong light. In this sense, it is strictly analogous to, perhaps we should say, identical with, the heating of bodies by exposure to light or radiant heat. They absorb part of the energy of the vibrations which fall on them; it becomes motion of their particles; and is again radiated from them as light or heat. Certain preparations, such as Canton's phosphorus (q.v.), indurated limestone, etc., possess this true phosphorescence in a very high degree. With the great majority of phosphorescent bodies, however, the duration of the phenomenon is very short, rarely more than a small fraction of a second. Becquerel, who has recently studied this phenomenon with great care, has invented a very ingenious instrument for the purpose, called a *phosphoroscope*. The body to be tried is placed in a small drum, which has an opening at each end. In this drum there revolve two disks, mounted on the same axle, and pierced symmetrically

with the same number of holes. They are so adjusted that when a hole in one disk is opposite to the hole in the corresponding end of the drum, the second disk closes the hole at its end of the drum, and *vice versâ*. Light is admitted by one of the holes in the drum, so as to fall on the object, and it is examined through the other hole. It is obvious that when the disks are made to revolve, the object is alternately exposed to light, and presented to the eye. By a train of multiplying wheels, these alternations may be made to succeed each other as rapidly as the observer pleases, and thus the object is presented in the dark to his eye as soon after its exposure to light as may be desired. Almost all bodies are found to be phosphorescent; for instance, some kinds of pink rubies, when exposed to sunshine in this apparatus, appear to glow like live coals in the dark. The phenomenon is, in fact, precisely that which was observed by Brewster and Herschel in quinine and certain crystals of fluor-spar, and thence called *fluorescence*. Stokes was the first to give the true explanation of these facts, and he showed it to depend upon the change of refrangibility (i.e., color) which light suffers on being absorbed and then radiated by the fluorescent substance. The green coloring-matter of leaves, a decoction of the bark of the horse-chestnut, and the common *canary* glass (colored with oxide of uranium), are bodies which exhibit this phenomenon very well. Perhaps the most striking method of studying the phenomenon is to receive in a darkened room the solar spectrum (q.v.) on a sheet of white paper; and to pass over the colored spaces a brush dipped in a solution of sulphate of quinine with citric acid. No change is produced on the less refrangible rays, but in the blue and indigo spaces a strange change of color is at once apparent where the liquid has been spread. This appears more strongly in the violet, and vividly in the spaces beyond the violet, where rays fall which excite no luminous sensation in the eye. By this experiment, the visible length of the spectrum may easily be doubled. By using the electric light, which is peculiarly rich in these highly refrangible rays, a prism of quartz, which allows them to pass very freely, and various fluorescent substances, Stokes has obtained spectra six or eight times as long as those otherwise visible. The characteristic of all these rays is that they are *less* refrangible than those from which they are produced. The entire phenomenon is identical in principle with Leslie's photometer, in which light was measured when changed into heat by absorption, in the colored glass of which one of the bulbs of his differential thermometer was formed.

Ordinary phosphorus (from which the phenomenon took its name) becomes luminous in the dark by slight friction; whence the common trick of drawing self-luminous figures on doors and walls with a stick of phosphorus, or an ordinary lucifer-match. A similar appearance is presented by putrescent animal matter, such as decaying fish, etc.; but these are effects of slow combustion, or chemical combination, and are not properly classed among the phenomena of phosphorescence. See Luminosity of Organic Beings.

PHOSPHOR'OSCOPE, a philosophical apparatus invented by Becquerel for measuring the duration of phosphorescence in different bodies. See Phosphorescence.

PHOS'PHORUS (symb. P., equiv. 31; sp. gr. 1.826) is one of the metalloids, or non-metallic elements, although, in its combining relation, it is more closely connected with the metals arsenic and antimony than with any of the members of the sulphur-group, in which it is commonly placed.

This substance affords an excellent example of allotropy; that is to say, it may be made to occur under different forms presenting different properties. See Allotropy.

Ordinary phosphorus and the red variety are the only important forms. We shall speak of them as phosphorus and red phosphorus respectively.

Phosphorus at ordinary temperatures is an almost colorless or faintly yellow solid substance, having the glistening appearance and the consistence of wax, and evolving a disagreeable alliaceous odor, which, however, is probably due to the action of the oxygen of the air upon it. It fuses at 111.2° F. (44° C.) into a colorless fluid; if the air be excluded, boils at 554° F. (290° C.), and is converted into a colorless vapor of sp. gr. 4.58. If it be heated to about 140° F. (60° C.) in the air, it catches fire, burns with a brilliant white flame, and is converted into phosphoric acid; and it is so inflammable that it will catch fire at ordinary temperatures by mere friction. As the burns which it occasions are often severe and dangerous, great caution is required in handling it; and in consequence of the readiness with which it catches fire, and of its tendency to oxidize when exposed to the air at a temperature higher than 32° F. (0° C.), it is always kept in water, in which it is insoluble. It is slightly soluble in ether and in the fixed and essential oils, but dissolves freely in carbon disulphide; and by allowing its solution in one of these fluids to fall upon filtering paper, the finely divided phosphorus absorbs oxygen so rapidly as spontaneously to catch fire as soon as the solvent has evaporated. One of the most characteristic properties of phosphorus is that it shines in the dark, probably from the slow combustion which it undergoes; and hence its name from the Greek words *phōs*, light, and *phŏros*, bearing. Its power of forming ozone is noticed in the article on that substance. Taken internally, phosphorus is a very powerful irritant poison; and it is the active ingredient of some of the preparations employed for the destruction of vermin. Its fumes give rise to a peculiar form of necrosis of the jaw, which is very common

amongst the makers of lucifer-matches, and is not followed, as in ordinary necrosis, by a formation of new bone.

Red phosphorus differs from the ordinary variety in several important points. It occurs as a deep red amorphous powder, which is perfectly devoid of odor, may be heated to 500° F. (260° C.) without fusing, has a specific gravity of 2.10, does not shine in the dark, nor take fire when rubbed, undergoes no change on exposure to the air at ordinary temperatures, and is in all respects far less inflammable. Moreover, it is insoluble in bisulphide of carbon and the other fluids in which ordinary phosphorus dissolves, and is not poisonous. Red phosphorus is used in certain brands of lucifer-matches, which ignite only when rubbed on a specially prepared surface. When red phosphorus is heated in an atmosphere of carbonic acid to a temperature of 500° F. (260° C.) it is converted, without loss of weight, into ordinary phosphorus.

Phosphorus is never met with in nature in an uncombined state, but it occurs in small proportion as phosphate of lime in the primitive and volcanic rocks (as was first shown by Fownes in 1844), by the gradual decay of which it passes into the soil; it is also found abundantly in the minerals known as *apatite* and *phosphorite*, and in the brown rounded pebbles which abound in the Norfolk Crag, and which, under the name of *coprolites*, are much employed, when crushed, for manure. From the soil, it is extracted by plants, which accumulate it (especially in the seeds of the cereals) in quantity sufficient for the wants of the animals which they supply with food. In the animal system, phosphate of lime forms 57 per cent of the bones; phosphates of the alkalies especially of soda, occur freely in the animal fluids; and in fibrine, albumen, and nervous matter, phosphorus is universally present, although we do not clearly know in what form of combination it occurs.

Phosphorus was originally discovered in 1669 by Brandt, a Hamburg chemist, who obtained it from urine. Gahn and Scheele were, however, the first to discover its presence in bone, and to employ that material for its preparation. The following are the leading steps of the method now usually employed in obtaining it on the large scale. Bones are burned to whiteness, and powdered; and this bone-ash is then mixed with sulphuric acid in such quantity as partially to decompose the calcium phosphate occurring in the ash $Ca_3(PO_4)_2$ into insoluble calcium sulphate, and a soluble acid calcium phosphate, whose composition is represented by the formula $CaH_4(PO_4)_2$. The solution of the acid calcium phosphate is evaporated to dryness and the residue ignited. Water is thus driven off and calcium metaphosphate $Ca(PO_3)_2$ formed. This is then mixed with charcoal, and submitted to distillation in an earthen retort exposed to a red heat. Phosphorus rises in vapor, and is conveyed, by means of a bent tube, into water, in which it condenses in yellow drops. In the retort the charcoal takes oxygen from a part of the calcium metaphosphate, forming carbonic oxide and setting the phosphorus free, and leaving behind normal calcium phosphate, $Ca_3(PO_4)_2$. Thus only a fraction of the phosphorus is evolved. Sometimes sand is added to the mixture in the retort; in that case all the phosphorus is obtained, the lime remaining behind as calcium silicate, $CaSiO_3$. The phosphorus drops are collected, melted under water, filtered through leather and cast into *sticks*, in which form it is commonly met with.

Phosphorus forms with oxygen two oxides—viz., *phosphorous trioxide*, P_2O_3 (which is always produced in small quantity when phosphorus is burned in air, but is of no practical importance), and *phosphorous pentoxide*, P_2O_5. There are three acids of phosphorus—viz., hypophosphorous acid, H_3PO_2, phosphorous acid, H_3PO_3, and phosphoric acid, H_3PO_4. Of these compounds, phosphorous pentoxide and phosphoric acid are by far the most important, and we shall therefore consider them first in order.

Phosphorous pentoxide, or *phosphoric anhydride*, as it is usually termed at the present day, is represented by the formula P_2O_5, and is obtained by burning phosphorus in a jar of perfectly dry atmospheric air or oxygen, when it is deposited in snow-white flakes at the bottom and on the sides of the jar, from whence it must be removed by means of a platinum spatula as quickly as possible, in consquence of its attracting moisture from the atmosphere, and placed in a perfectly dry flask. When dropped into water, it combines with it, and dissolves, evolving a considerable amount of heat, and emitting a hissing sound, as when red-hot iron and water come together. In consequence of its strong affinity for water, it is very useful as a desiccating agent.

There are three hydrates of phosphorous pentoxide, each of which possesses the properties of a distinct acid—viz., a monohydrate, $H_2O \cdot P_2O_5$, a dihydrate, $2(H_2O) \cdot P_2O_5$, and a trihydrate, $3(H_2O) \cdot P_2O_5$. These hydrates retain their characteristic properties when dissolved in water, and combine with one, two, or three equivalents of bases to form salts, according to the hydrate employed. In the salts formed by the first hydrate, the one equivalent of water is replaced by one equivalent of base; in those formed by the second hydrate, both equivalents of water may be replaced by two of base, or one equivalent of water alone may be replaced, while the other remains in the salt as basic water; and in those formed by the third hydrate, all three equivalents of water, or two, or only one, may be replaced by base, so that this acid forms three sets of salts. Hence phosphoric acid is what is termed a *polybasic acid* (q.v.). The following scheme may elucidate this remark: If M, M′, M″, are any three monad metals, whose oxides act as bases, the monohydrate H_2O,P_2O_5 forms the salt M_2O,P_2O_5, and is monobasic; the dihydrate $2(H_2O),P_2O_5$ forms the salts M_2O,M'_2O,P_2O_5 and M_2O,H_2O,P_2O , and is bibasic; the trihydrate $3(H_2O),P_2O_5$

forms the salts M_2O,M'_2C,M''_2O,P_2O_5, M_2O,M'_2O,H_2O,P_2O_5, and $M_2O,2(H_2O)$, P_2O_5, and is tribasic.

The occurrence of phosphoric acid (in a state of combination) in the three kingdoms of nature has been already noticed in our remarks on phosphorus. The discovery of the acid was made in 1740 by Marggraf; the discovery of its true chemical nature is, however, due to Lavoisier; and that of its various modifications and its polybasicity, to the investigations of the illustrious Graham.

Phosphorous acid is the trihydrate of phosphorous trioxide, P_2O_3, thus: $3H_2O \cdot P_2O_3$ or H_3PO_3. *Hypophosphorous acid*, H_3PO_2, occurs as a very acid, colorless, uncrystallizable syrup. There is no corresponding oxide.

Phosphorus combines with hydrogen in three proportions to form gaseous hydrogen phosphide, PH_3; liquid hydrogen phosphide, P_2H_4; and solid hydrogen phosphide, P_4H_2. Of these, the first alone requires notice in these pages. There are various processes for obtaining the gas; one of the simplest being by boiling fragments of phosphorus in a concentrated solution of hydrated potash, in which case, hypophosphite of potash is formed, while phosphureted hydrogen gas is evolved. The reaction is explained by the equation $3KOH + P_4 + 3H_2O = 3KH_2PO_2 + PH_3$. The gas thus evolved is colorless, possesses a characteristic fetid odor, and has the remarkable property of taking fire spontaneously in atmospheric air or in oxygen gas, and of resolving itself into anhydrous phosphoric acid, and water—a phenomenon of which prof. Miller has given the following graphic description: "If allowed to escape into the air in bubbles each bubble as it breaks produces a beautiful white wreath of phosphoric acid, composed of a number of ringlets revolving in vertical planes around the axis of the wreath itself as it ascends; thus tracing before the eyes, with admirable distinctness, the rapid gyratory movements communicated to the superincumbent air by the bursting of a bubble upon the surface of a still sheet of water. If the bubbles be allowed to rise into a jar of oxygen, a brilliant flash of light, attended with a slight concussion, accompanies the bursting of each bubble." There is reason to believe that *perfectly pure* phosphureted hydrogen gas does not possess the power of igniting spontaneously, and that the self-lighting gas always contains a minute quantity of the vapor of the liquid phosphide, P_2H_4. The luminous phenomenon known as *will-o'-the-wisp* has been referred to the natural evolution of the gas; there is, however, no scientific evidence in favor of this hypothesis.

Various compounds of phosphorus with sulphur, chlorine, iodine, bromine, etc., have been formed and investigated; but none of them are of any practical importance.

The medicinal uses of *phosphorus* and *phosphoric acid* have still to be considered. Phosphorus, dissolved in ether or oil, was formerly prescribed in very minute doses as a stimulant to the nervous system in certain conditions. It is, however, now rarely employed in medicine, at all events, in this country, in consequence of its poisonous properties. Several cases are on record in which children have been killed by sucking the phosphoric ends of lucifer-matches; and Christison relates an instance in which a grain and a half of phosphorus proved fatal.

The symptoms induced by this poison are those of acute inflammation of the stomach and bowels, and the only treatment that can be recommended is the administration of large quantities of mild demulcent fluids, such as milk and thin arrowroot, so as, if possible, to envelop the phosphorus, and exclude it from the action of the air in the intestinal canal; and of magnesia, with the view of neutralizing any phosporous and phosphoric acids that may be formed.

Dilute phosphoric acid is included in the regular pharmacopœia, but is not very much employed. It may be prescribed in much the same cases as those in which sulphuric and nitric acids are employed, and is less likely to disturb the digestive functions, if employed for a long period, than the other mineral acids. The late Dr. Paris used to recommend it, when properly diluted, as the best acidulated drink for assuaging the thirst in diabetes. It may be prescribed in half-dram doses.

PHO'TIUS, Patriarch of Constantinople in one of the most critical periods of the struggle of that see with the great patriarchate of the west for supremacy in the entire church, was a member of a patrician family of Constantinople, and was b. in the early part of the 9th century. From youth he was distinguished by his abilities and learning; and having served in various important public offices, and especially on a diplomatic mission to Assyria (or more probably Persia), he secured the favor of the emperor Michael, with whom Photius's brother was connected by marriage, and of all-powerful Cæsar and his favorite Bardas. The patriarch Ignatius having incurred the displeasure of Bardas and of the emperor, a weak and profligate man, whose vices Ignatius tried in vain to correct, it was resolved to deprive him of the patriarchal dignity; and the attempt to induce him to resign having failed, he was deposed with much indignity, imprisoned, and sent into exile. Photius, although a layman, and hitherto engaged in secular pursuits, was appointed in his stead, hurried in a few successive days through all the stages of sacred orders, and finally installed as patriarch. A council of bishops, under the influence of the court (858), declared in favor of the deposition of Ignatius, and confirmed the election of Photius, and the latter communicated his election to the pope, Nicholas I., in a letter which carefully suppressed all these irregularities, and represented that he had reluctantly undertaken the office. Meanwhile, however, Ignatius had privately written to Rome, and the pope sent two legates to inquire and report on the facts. A new council

was assembled (859), by which Ignatius was deposed. Nicholas insisted on a new hearing. A new cause of dispute arose respecting the jurisdiction of the see of Constantinople, and the council, called at Rome, in 862, annulled the acts of the former one and reinstated Ignatius. Photius, retaining possession with the emperor's help, assembled a council at Constantinople in 867; a controversy of doctrine and discipline between the eastern and western churches resulted, and the council, after excommunicating Nicholas and his abettors, withdrew from the communion of the see of Rome. In 869 Michael was put to death by Basil the Macedonian, when Photius was banished to Cyprus and Ignatius reinstated, and at a council, known as the eighth general council, assembled at Constantinople, Photius was convicted of fraud and usurpation, and the intercommunion of the churches restored. Photius, however, finally obtained his recall, and succeeded Ignatius on the death of the latter, Pope John VIII. acquiescing, an act for which he was nicknamed *Joanna*, this *sobriquet* possibly originating the story of Pope Joan (q.v.). Photius in 879 assembled a new council at Constantinople, again condemned the western church and revived the doctrinal controversy. The separation of the churches, however, was not completed till the time of Michael Cerularius. See Greek Church. In 886 Photius was exiled to Armenia by Leo, the son and successor of Basilius, and died about 891. The Greeks defend his memory, but the westerns accuse him of craft, violence, and perjury. His genius, at all events, was rare, and his literary judgment profound. His chief remains are (1.) *Myriobiblon*, called also *Bibliotheca*, a summary review of 279 works which Photius had read, many of which are now lost. (2.) A *Lexicon*. (3.) The *Nomocanon*, which is a collection of the acts and decrees of the councils and ecclesiastical laws of the emperors. (4.) Several minor theological treatises. (5.) A collection of letters, many of them extremely interesting and elegant. See Hergenröther's monograph on P. (1869).

PHOTOGRAPHY and **PHOTOGRAPHIC PROCESSES** (Gr. *phos*, light, and *grapho*, I write. As the terms "positive" and "negative" are constantly used in photography, it will be well to explain them at the outset. In their ordinary meaning, the one is the reverse of the other as regards light and shade. But with respect to a photographic picture on glass, its being a positive or a negative really depends upon whether it is viewed by reflected or transmitted light. Daguerreotypes are all positives, because they are taken on metal plates, and can only be seen by reflected light. Our picture on glass is also positive when viewed in the same way, but glass being transparent, it is negative when looked at by transmitted light—that is, when held between the eye and the light. Those portions of the image which are light in the positive way are dark in the negative way. This will be quite plain to any one who looks at such a picture by both lights, laying it on black cloth for the positive view. For convenience, it has become the practice to call a photographic picture a negative if it is intended to print positive pictures from it. In a negative the parts intended to print black on the paper are completely transparent, the whites are completely opaque, and the gradations between are the intermediate shades. Usually, the negative is on glass and the positives are prints on paper, but many negatives are on paper made translucent by means of wax, or they may be on gelatine. A photographer generally manipulates his picture differently, according as he intends it for a negative or a positive, so that a photograph on glass can scarcely be at the same time a pleasing positive or a good negative; but this is a mere technical detail.

History.—It is usual to regard the observation by the alchemists of the 16th c. that *luna cornea*, or horn silver, is blackened on exposure to light, as the first important step in the history of photography. This property of chloride of silver, and also the darkening of nitrate of silver by light in the presence of organic matter, constitute the leading facts on which the science of photography is based. In 1777, the famous Swedish chemist Scheele found, by experiment, that horn silver was blackened quickest by the violet ray of the solar spectrum, thus proving that the rays of light are not all alike chemically active. A quarter of a century later, Ritter of Jena demonstrated the existence of chemically active non-visible rays beyond the violet ray of the spectrum.

The honor of having been the first to produce pictures by the action of light on a sensitive surface is now very generally conceded to Thomas Wedgwood, an account of whose researches was published in 1802 in the *Journal of the Royal Institution*, under the title: "An Account of a Method of copying Paintings upon Glass, and of making Profiles by the Agency of Light upon Nitrate of Silver; with Observations by H. Davy." The misfortune was, that no attempts made either by Wedgwood or Davy to prevent the uncolored portions from being acted on by light (or, as we now say, to *fix* the picture) were successful.

M. Niepce of Chalon-on-the-Saone was the first to enjoy the satisfaction of producing *permanent* pictures by the influence of solar radiations. This was accomplished in 1814, and the name chosen to designate his process was heliography. It consisted in coating a piece of plated silver or glass with asphaltum (bitumen). The plate so prepared was then exposed in the camera obscura for a length of time, varying from four to six hours! Wherever the light acted, it rendered the asphaltum insoluble in certain essential oils. Hence, on subsequent treatment with one of these solvents, the shadows of the image dissolved away, and the lights were represented by the insoluble asphaltum remaining on the plate.

Daguerre appears to have begun in 1824 the experiments which eventually led to the

discovery of the daguerreotype process. On Daguerre's learning that Niepce was working in the same direction as himself, the two formed a partnership in 1829. The discovery of the daguerreotype was announced in January 1839, but the details of the process were not made public till August of the same year. It consists in exposing a metal plate covered with iodide of silver for twenty minutes in a photographic camera, the plate being afterwards transferred to a dark room, and exposed to the vapor of mercury, which develops the latent image, it being afterwards fixed (see DAGUERREOTYPE). Although this process has become almost obsolete, it was really the first which was of any practical value. While Daguerre's processes for the purpose were imperfect, he still succeeded in fixing his pictures; although it was sir John Herschel who announced the great suitability of the hyposulphites for dissolving the haloid salts of silver.

Mr. Henry Fox Talbot read a paper to the Royal society on "photogenic drawings" on Jan. 31, 1839, just six months previous to the publication of Daguerre's process. He produced these in this way: Writing-paper was steeped in a solution of common salt, and dried. It was then dipped in a solution of nitrate of silver, which is changed by the action of the common salt into the chloride of silver, some of the nitrate, however, remaining unaltered. Paper so treated is extremely sensitive to light, so that when a fern leaf, for example, is placed close down upon it between two plates of glass, the paper blackens except where it is covered, and thus a reversed picture of the leaf on a black ground is obtained. This *negative* was then placed over another sheet of paper, prepared in the same way, and the light allowed to act through it. Another picture of the leaf was thus produced, but this time with its lights and shades, the same as in nature, in other words, a *positive* print was got. A large number of these positives was obtained from one negative. Talbot fixed the print with bromide of potassium.

The Calotype process was patented by Mr. Fox Talbot in 1841. It is sometimes called the Talbotype process. He had now so far perfected a photographic process, that the steps in it remain practically the same to the present day, although the materials used to some extent differ. Talbot produced his negative by preparing paper on the surface with iodide of silver, subsequently washing it over with a mixture of nitrate of silver, with gallic and acetic acids, and then exposing it in the camera to the object he wished to copy. The invisible image or picture thus obtained was developed by aceto-nitrate of silver and gallic acid, and fixed with bromide of potassium. The paper negative was then waxed and used for the production of many positives in the way described above.

Photographic Apparatus.—The most important piece of apparatus used by the photographer is the camera obscura (q.v.), generally called simply a camera. On the front portion, a suitable glass lens is fixed, which throws the image on a ground glass screen placed at the back, to enable it to be sharply focused. A thin flat box with a shutter, together called a "slide," contains the sensitized plate. When the picture is focused, the screen is withdrawn and the "slide" is inserted in its place; the shutter is then drawn out, and the sensitized plate, which exactly occupies the place of the glass screen, being now exposed, receives the picture. In a brief time, which nowadays varies from a fraction of one to several seconds in a good light, the shutter is closed, and the slide returned to a dark room, where the plate is taken out and developed. If a dark tent is not used, it is necessary, when working in the field, to take as many dry sensitive plates put up into double slides, as one intends to use in one day, unless a "changing box" be adopted.

Lenses.—The quality as well as the kind of lens used is of great importance. For an explanation of the different forms and properties, see LENS. A lens which is well adapted for taking portraits or other objects in a room is not suitable for taking landscapes. In the one case, it is only necessary for the lens to give a sharp definition of a figure a few feet off, and to do its work rapidly, while what is required in the other is, that distant objects, lying in far different planes, should be clearly defined. To effect this, the curves of the lenses, as well as their distance apart in the compound arrangement, must be different in each case. For ordinary landscape work, indeed, a single lens of the meniscus form may be used, as the distortion it gives is not much noticed, but a properly constructed double lens is better. When architectural subjects are to be photographed, a combination of lenses which correct all distortion must be adopted, otherwise vertical lines converge, and therefore appear out of the perpendicular. What is called a "wide-angle" doublet lens is used for taking a view of a building in a narrow street, where the operator cannot retire far enough to take in the whole pile with an ordinary lens. A doublet lens of the ordinary kind for landscape work embraces an angle of about 50°, while a wide-angle doublet embraces about 90°—that is, these lenses cover circles whose respective diameters subtend angles of 50° and 90° from their optical centers.

A diaphragm or stop is used along with the lens. This is a thin disc of metal perforated with holes of different sizes, the largest of which is much less in diameter than the lens itself, opposite the center of which any of the perforations can be placed. Since the central rays and the marginal rays have different points of intersection, the object would be wanting in definition if the whole lens were used.

Wet Collodion Process.—Collodion (q.v.) is the name given to a solution of gun-cotton in a mixture of ether and alcohol. When this is spread over a glass plate, it gradually dries into a transparent film. It was first introduced for photographic purposes in 1851 by Mr. Scott Archer, and has been of important service. For fully a quarter of a cen-

tury, the wet collodion process was almost exclusively practiced by photographers. Dry collodion processes have also been in use, although on a greatly more limited scale. All of these are now largely superseded by a method in which gelatine takes the place of collodion. These are the stages in the wet collodion process: (1.) A glass plate made perfectly clean is coated with collodion, to which the bromide of cadmium, and either iodide of potassium or iodide of ammonium, have been added. (2.) The collodionized plate is "sensitized" by immersion in a bath of nitrate of silver, containing 35 grains to every ounce of distilled water. (3.) Production of latent image by exposing the sensitized plate in the camera obscura after the object has been focused. (4.) Development of latent into visible image by flooding the plate in a solution of sulphate of iron (ferrous sulphate), or of pyrogallic acid, to either of which some alcohol and acetic acid are added. (5.) Fixing of the permanent image by immersion of the plate in some solvent of the unactinized silver salts—that is, of those parts of the sensitive surface upon which the light has not acted. For negatives from which paper positives are to be printed, the solvent is a solution of hyposulphite of soda (sodium hyposulphite). For positives—that is, where the original photograph on glass is to be kept as a positive, the solvent is cyanide of potassium.

Dry-Plate Processes.—A few only of the earlier dry-plate processes will be named, since, except for experimental purposes, they have all been superseded by the gelatino-bromide process. Several advantages arise, especially for field-work, from using dry sensitive plates. With the wet process, the operator, away from his studio, must carry a dark tent, collodion, a silver bath, and developing agents; but these impedimenta are not required with dry plates, which, however, have (or had) some disadvantages. Dry-plate processes are of two principal kinds: (1.) Those in which the collodion is applied to the glass plate, and afterwards sensitized in the silver bath, as in the wet way, but with a preservative such as albumen "flowed" over the surface, and the plate allowed to dry. (2.) Emulsion processes, in which the sensitive silver salt is held in suspension in the collodion or gelatine. A good emulsion is made by adding some soluble bromide, such as bromide of cadmium, to the collodion, and afterwards an alcoholic solution of nitrate of silver. The glass plates are simply coated with this emulsion, and set aside to dry, when they are ready for use.

The earliest form of the gelatino-bromide process appears to be due to Dr. Maddox, who published the details of a workable emulsion of this nature in 1873 by Mr. Kennett, and again in 1878 by Mr. Charles Bennett. It was found that if the emulsion was kept at a temperature of 90° F. for some days, or boiled for half an hour, the sensitiveness of the plate coated by it was so greatly increased, that a view which could only be taken formerly in 30 seconds, could now be taken in one. A very sensitive gelatine emulsion can also be formed by using ammonia along with the bromide of silver. Dry plates produced by some form of the gelatino-bromide process are now manufactured on a large scale. When properly made, they will keep an indefinite length of time, and they can be developed months after having been exposed. Dry plates can now be made so very sensitive, that in a good light a negative can be taken in $\frac{1}{60}$ part of a second. To obtain a well-defined photograph of an express train in motion, of a swallow poising, or of moving waves or clouds is no longer a matter of difficulty. In the taking of these photographs, what is called an "instantaneous shutter" is required for the lens of the camera—that is, a cover which, by some means such as a spring, will admit light for only a fraction of a second. An important improvement has been made by Mr. Warnerke in doing away with glass for carrying either collodion or gelatine films for negatives, by the use of a paper backing for the sensitive film. Owing to the dry-plate process, it has become possible to photograph successfully landscapes in moonlight, burning fire-works, interiors lighted by gas, etc., the time required for exposure, however, greatly exceeding that allowed for photographs taken by daylight. It has been found that in taking such views the diaphragm may be discarded without consequent loss of clearness.

Photographic Printing: Silver Prints.—As already stated, the production of a silver print on paper depends upon the action of light on chloride of silver. The process is still conducted in essentially the same way as it was originally by Mr. Fox Talbot. A sheet of paper prepared with chloride of silver is exposed to light under a negative, and pressed close to it. In a short time, if the day is bright, a print of the picture is obtained which is fixed by hyposulphite of soda (sodium hyposulphite). The details of the process are briefly as follow: (1.) Suitable paper is coated on the surface with a smooth thin layer of albumen, to which chloride of sodium or of ammonium has been added. (Occasionally, the paper is salted only—that is, impregnated with common salt.) (2.) Silvering of the paper by floating it in a solution of nitrate of silver, 60 grains of this substance being used for every ounce of water. It is afterwards dried. (3.) Exposure to light. The silvered paper is exposed behind the negative in a printing frame with a glass front. The time of exposure varies from ten minutes to two or three hours, but occasionally much longer, according to the brightness of the light and the character of the negative. (4.) Toning. In order to give a pleasing color to the print, it is usual to tone it in a solution of trichloride of gold. (5.) Fixing. The print, when taken from the toning bath, is steeped in a solution of hyposulphite of soda, which removes the undarkened silver salt, and so fixes the image. (6.) Washing. Silver prints require to be washed thoroughly after treatment with the hyposulphite of soda. Imperfectly washed prints soon spot and fade.

Platinotype, or *Platinum Printing Process.*—This kind of printing is a good deal used, as the prints are believed to be permanent, and they are liked by some for their appearance, which differs considerably from that of silver prints. Captain Abney, F.R.S., thus describes the method which gives the best results: "Mr. W. Willis, jr., found that he could obtain an image in platinum black, by means of development, if he sensitized his paper with ferric oxalate, with which was mixed a solution of chloro-platinite of potassium. The action of light on this paper is to reduce the ferric salt to the ferrous state, and when the ferrous salt is in solution, the platinous salt is reduced by it. By floating the exposed paper on a solution of neutral potassium oxalate, which is a solvent of the ferrous oxalate, the platinum salt in contact with it is immediately reduced to the metallic state, and an image is thus built up. To fix the prints, they are immersed in dilute hydrochloric acid, which dissolves away any ferric oxalate there may be, and also gets rid of any oxalate of lime."

The Carbon Printing Processes.—So far back as 1839, Mungo Ponton announced that paper steeped in bichromate of potash and dried, changed its color when exposed to light. It was subsequently discovered that light not only alters the composition of the bichromate, but also oxidizes the size (gelatine) of the paper. Gum, starch, and albumen were also found to become, like gelatine, insoluble when exposed in contact with the bichromate of potash to the action of light. Swan, Woodbury, the Autotype co., and others have utilized this property of gelatine in their processes. In order to see clearly the effect of light on bichromatized gelatine, captain Abney suggests that these three simple experiments be tried. Prepare pieces of paper, by brushing them over with a viscous solution of gelatine, in which is dissolved six per cent. of bichromate of potash, and expose them beneath negatives of line engravings. On immersing one of them in cold water, it will be noticed that the parts protected from the light immediately begin to swell through the absorption of water, whilst those portions unprotected remain unchanged. On immersing another sheet in hot water, the protected gelatine will dissolve away entirely, whilst the rest will remain firmly attached to the surface of the paper. Let a third sheet of the exposed gelatinized paper be brushed over with thin, greasy, lithographic ink, and after soaking in cold water, a wet sponge may be applied to remove all the ink that will come away. It will be found that the non-absorbent parts retain the ink, while the latter reject it.

Swan's Carbon Process.—This is understood to be the first of the permanent printing processes with pigmented gelatine which was commercially successful. In its main features, it resembles what is now called the autotype process. By Swan's method, the paper is coated with a layer or thick film of gelatine which has been previously colored all through its thickness with some permanent pigment such as lampblack. This color is made of carbon in the state of fine soot, hence the name given to the process. The paper so coated is sensitized with ammonium bichromate, and then exposed under a negative till it is supposed to be sufficiently printed. In this case the image is not seen as in a silver print, therefore some indirect plan of telling the proper time of exposure, such as by the use of an actinometer, must be resorted to. The change which takes place in the gelatine film is this: The surface of it next the negative has been rendered insoluble wherever the light has acted, and that to a depth corresponding to the intensity of the light. It results from this, that almost the whole of the surface of the gelatine has been rendered insoluble, but to the greatest depth where the light has acted most strongly. Insoluble portions, however, remain inclosed between its surface and the paper. No picture is visible till these are removed. In this process, the external surface of the exposed gelatine is cemented to a second sheet of paper by means of a solution of india-rubber. Therefore the gelatine layer, with its undeveloped image, is now placed between two sheets of paper; but when it is immersed in hot water, the original backing of paper is easily stripped off, after which the soluble gelatine dissolves away, leaving a picture in pigmented and insoluble gelatine. The image is, however, reversed, so that an object such as a tree seen on the right in the negative now appears on the left in the print. This is obviated by the use of a reversed negative, or by making a double transfer.

Autotype Process.—In most respects, this so closely resembles Swan's process that it is only necessary to note some of the improvements introduced or adopted by the Autotype company, who have acquired a number of patents by others (including Swan's) bearing on their process. The print is produced in bichromatized and pigmented gelatine; but the preparation of the paper, both of that which is to form the temporary and the permanent support for the print, differs in the autotype process, and so also does the way of transferring the print to the paper on which it is to remain. The "pigmented tissue," as the prepared paper used for these prints is called, can be made with a gelatine solution thus composed: Flake gelatine, 1500 grains; brown sugar, 150 grains; honey soap, 150 grains; glycerine, ½ oz.; water, 14 oz. Lampblack or some other pigment is added, with a little warm gelatine and glycerine, to the above. The solution is made hot in a porcelain dish, and the paper floated over it. The Autotype company make the tissue on a large scale and supply it to the public. We have seen that in Swan's process the undeveloped gelatine print adheres to the paper support to which it is transferred by a solution of india-rubber, while by the autotype way, it is transferred to a paper made impervious to water by a coating of insoluble gelatine. An application of pressure with

a flat bar of wood covered with india-rubber, called a squeegee, causes the exposed print to adhere to the impervious paper, and the soluble gelatine is removed by hot water after the original paper backing has been stripped off as described above. This is called the single transfer process. The double transfer process merely differs in the adoption of a second temporary support of opal glass, zinc, or paper coated with a suitable preparation, to get a print which is not reversed.

Woodburytype and Stannotype Processes.—More than thirty years ago, it was found that if a leaf, a bit of lace, or any similar object was placed on a sheet of soft metal, and considerable pressure applied, the impression of leaf or lace was sunk into the metal. From this metal plate prints were taken as from an engraved plate, and the process was called nature printing (q.v.). If we laid an ordinary autotype print instead of a leaf on a flat piece of iron, covering it at the same time with a smooth piece of sheet-lead, and then put them under sufficient pressure, the result would be an imperfect Woodburytype mould in the soft lead. The metal reverse would be faulty, because in this case the gelatine film is too thin to give enough of relief. In order to obtain a proper mould, a layer of sensitized gelatine, considerably thicker than that used for an autotype print, is exposed under a negative. It is developed as in the autotype process, and presents the image in considerable relief. The print is then covered with the lead, and they are pressed together in a hydraulic press, which produces a reverse or mould of the picture in the soft metal without injuring the gelatine relief.

The production of ordinary Woodburytype prints is a purely mechanical operation, the chemical action of light not being called into play. The mould is placed in a printing-press of a peculiar but simple construction, and a viscous solution of pigmented gelatine forms, so to speak, the printing ink. This is poured on the mould, and a thin, hard, strongly-sized paper placed on the top of it. The lid of the press has beneath it a perfectly flat glass plate, which is now brought down on the mould and the lid firmly locked by a catch. The pressure causes all the superfluous gelatine to exude, whilst that in the mould adheres to the paper. In a short time the gelatine sets, when the plate is raised and the print withdrawn. It has now only to be placed in a solution of alum, which renders the gelatine forming the picture insoluble.

The Stannotype (or printing from a surface of tin) has been called a simplified Woodburytype process, and is becoming much used. Mr. Woodbury, to whom it also is due, thus describes it: "A positive is first made from the negative—preferably by the carbon process. From this carbon or other transparency a negative is made also in carbon; but in this case the tissue possesses much more body and much less color, so as to obtain a certain amount of relief. This (gelatine) relief negative is then coated with a thin india-rubber varnish. A piece of tinfoil is laid over it, and the whole passed through a pair of india-rubber rollers—a species of mangle, in fact. We have now a printing mould ready for placing in the press and printing from in gelatinous ink."

Heliotype and Phototype Processes.—Both of these are photo-mechanical methods, in which the gelatine picture is itself used to print from in some form of printing press, instead of being covered with tinfoil as in the Stannotype process. Lithographic ink is used. The film or layer of gelatine forming the printing surface requires to be specially and carefully prepared.

Photographic Enamels on Glass and Porcelain: Powder Process.—By what is called the powder process, prints are produced on paper in plumbago. It has been a good deal used on the continent. A slightly sticky or "tacky" preparation of sugar, gum, glycerine, and potassium bichromate, when exposed to light, loses its tackiness in proportion to the intensity of the light acting on it. A glass plate coated with this preparation will therefore, when exposed under a negative, represent the picture, so to speak, by different degrees of tackiness. In this state, a fine powder sprinkled over it will adhere in proportion to the stickiness of the surface. When the superfluous powder is removed, and the film coated with tough collodion, it can be detached and, if required, put on any support such as paper, but the soluble portion of the gum, etc., is previously removed by washing.

If some powdered metallic oxide, instead of plumbago, is dusted over the undeveloped picture, supposing it to be either on glass or china, and heated in a suitable kiln, it will become vitrified in the same way as an enamel color, when painted on, does.

Cyanotype Printing: Copying of Plans.—This is a simple and useful way of copying geometrical drawings. The drawing is made on tracing cloth or tracing paper in strong, or at least distinct, black lines, and this forms the negative. A sensitizing bath can be made of 1 ounce of citrate of iron and ammonia, 1 ounce of red prussiate of potash (potassium ferricyanide), and 8 ounces of water. An even coating of this is applied to a sheet of paper. When dry, the tracing is placed on the top of the paper, and both are covered with a glass plate to keep them in perfect contact. Ten minutes in a very bright light will suffice for exposure. The print is now washed, when the lines of the drawing will appear white on a blue ground.

Durability of Photographic Prints.—Experience has proved that silver prints, however carefully prepared, cannot be depended upon for permanency. Platinotype prints are believed to be permanent by those best able to judge, but still this is not altogether certain. Autotype, Woodburytype, and other prints in pigmented gelatine are presumably permanent, and of course those obtained by any of the photo-mechanical processes are certainly so when printed, as they usually are, in lithographic or printers' ink.

Photo-Lithography and Zincography.—The only difference between these is, that a lithographic stone is used in the one case and a plate of zinc in the other for the mechanical printing. By what is called the transfer process, this art is now largely practiced, especially for the reproduction of architectural and mechanical drawings and ornamental designs. It is necessary that the original drawings should be done in lines and not in half-tint. At least, it is doubtful whether much success has as yet attended the production of half-tint photo-lithographs. A negative is taken from the drawing by the camera, and from it a print is made on paper coated with bichromatized gelatine much in the same way as in the autotype process. But before the print is developed, it receives a coating of lithographic transfer ink specially prepared for the purpose. It is next floated in warm water till the lines are seen as depressions. With the aid of a sponge and water at a temperature of about 150° F., the soluble portion is removed, leaving the picture in insoluble gelatine with its coating of transfer ink. It now only requires to be washed, dried, and transferred to the stone or zinc plate (see LITHOGRAPHY). Photo-lithographic prints have, as a rule, a disagreeably hard appearance if an atmospheric or distant effect is required.

Photo-Reliefs.—This term is applied to a picture in relief on metal which can be used like a woodcut in the ordinary printing-press. The image from an inked "transfer" of the same kind as that used in photo-lithography is transferred to zinc so as to form a resist to an etching fluid. Finely powdered rosin is added to the layer of ink to make a still better protecting surface. Weak hydrochloric acid is then applied, which so far etches the picture. Dilute sulphate of copper is next flooded over the zinc, which produces a fine deposit of metallic copper on the bare parts of the zinc. The plate is again immersed in the acid, and voltaic action now takes place, causing the zinc to dissolve where not covered by the ink. When the action ceases, the plate is washed with water. More ink and rosin, as well as new copper solution, is applied, and the plate again put into the acid. This operation is repeated till a sufficient depth is given to the relief. Electrotypes, which are sometimes faced with steel, are made from these zinc reliefs. This process is said to give very good results. There are a number of ways of making these relief blocks, several of which are by the use of a fatty transfer in some similar way to that above described, but without the voltaic action.

In the United States, a relief is made by exposing for a sufficient time a sheet of gelatine one-sixteenth of an inch thick under a negative picture, and, after fastening it to a flat piece of type-metal, the "unprinted" portion of the gelatine is dissolved in hot water. The "printed" portion is then in strong relief and can be used to print from, but it is generally electrotyped.

Photo-Engraving: Heliogravure or Photogravure.—Here, as in photo-lithography, the processes employed are for the most part only adapted to the reproduction of line work as distinguished from drawings in half tone or photographs from nature. It is curious that, so far as is publicly known, some of the best photo-engraving processes in use at the present time are based on the principle discovered by Niepce in the early part of the century, that bitumen of Judæa (asphaltum), when exposed to light, becomes insoluble in its ordinary solvents. Accordingly, the image which he got in the camera obscura on a silver plate coated with asphaltum was made bare, by the application of a solvent, to those parts which where not rendered insoluble. Up to the biting stage, a metal plate—usually copper—is still treated in a similar way. In the development, the asphaltum is softened with olive oil, and then turpentine is applied to dissolve the soluble portions, which leaves the lines forming the picture bare. It is then etched with diluted hydrochloric acid.

The production of meritorious half-tone engravings by a photographic method has proved itself to be a matter of great difficulty. Some modifications of the methods patented by Mr. Fox Talbot in 1852 and 1858 are understood to be in use. He called his process photoglyphic engraving. Talbot got the image with bichromatized gelatine. The necessary grain was given to the plate in two ways. By one of these he coated it after development with a fine deposit of rosin. It is then ready for the etching fluid. By the other method, he took fine muslin or netting, and applied it by mechanical pressure to the plate, which covered it with fine cross-lines. Goupil of Paris has a process which is believed to be worked upon the plan of forming a gelatine image, and then electrotyping it. Mr. Warnerke has produced photo-engraved plates—copies of ordinary engravings—which can hardly be distinguished from the originals. It is understood to be by an asphaltum process.

Photography is now much employed to transfer drawings and pictures from nature on to the wood for the wood-engraver. This process is of much importance, as the original drawing is preserved, not only for comparison with the finished engraving, but it may be for its artistic value. The drawing also may be made of any convenient size, and reduced on the wood, a great consideration when minute objects are to be represented. One process is as follows: The surface of the wood is prepared with a ground of water-color Chinese white, and to harden it enough to resist the subsequent washings, the enamel of a glazed card is added. It is then coated three times: (1) With a solution of albumen, and dried; (2) with a solution of albumen and chloride of ammonium, and again dried; (3) with a mixture of 1 ounce ether, 1 ounce alcohol, 8 grains gun-cotton,

and 30 grains nitrate of silver. On this surface the subject is printed from the negative, after which the collodion is dissolved off by alcohol and ether. The image is fixed with hyposulphite of soda, and when washed and dried, is ready for the engraver, who now engraves the block in the usual way.

Photo-Micrography consists in the enlargement of microscopic objects, by means of the microscope, and the projection of the enlarged image on sensitized collodion. It is necessary to employ a collodion yielding what is termed a structureless film. The principle upon which the enlargement is effected is that of the conjugate foci. By reversing the arrangement, minute photographs of engravings, or other objects, may be produced which would require a microscope for their inspection.

Celestial Photography comprehends the application of photography to the automatic registration of celestial phenomena. Among the facts established by Warren de la Rue's researches is the demonstration of the sphericity of the moon by means of the stereoscope and lunar photographs, also the determination of the nature of many of the more obscure markings on its surface, by which elevations are clearly distinguished from depressions. The faculæ and spots on the sun's surface have also been photographed, and examined stereoscopically, by which they have been found to arise from elevations of the outer regions of the photosphere. Photographs have also been obtained of Lyra and Castor, and of the nebulæ in Orion. The instrument employed for the purpose is called a photo-heliograph. Photography has also been extensively employed in connection with solar and stellar spectroscopy.

Photography in Colors.—It has long been the dream of photographers to devise some process by which the camera can fix not only the features, outlines, and light and shade of the objects photographed, but their natural colors as well. Many attempts have hitherto been made, but none of them can be fairly described as more than partially successful. As early as 1810, Seebeck observed that chloride of silver takes approximately the colors of the incident rays. In 1840, Herschel observed that colors could be rendered with some exactness on sensitized film. Eight years later M. Edmond Becquerel succeeded in obtaining the prismatic colors upon a film of sub-chloride of silver spread upon a plate similar to the one employed by Daguerre, but this picture requires a long exposure, and disappears after a while. Other experimenters obtained similar results, but the same grave difficulty remains—exposure to the light ultimately destroys the picture. In 1869 MM. Ducos du Hanson and Charles Crox proposed, independently, a process which was fairly successful in theory, but too complex for practical use. It consisted in taking several proofs in various tones, and then, by successive printings, superimposing these tones—an operation that gave results similar to those of chromo-lithography, but with no exactness of color.

A close approach to success has been made by an Englishman, Mr. F. Bligh Bond, who in 1890 succeeded in making three gelatine plates sensitive to the yellow, blue, and red rays of the spectrum, respectively. These plates after being developed are printed from by the Collotype process, and give good results as far as they go. In February, 1891, Prof. Gabriel Lippmann, professor of Physics at the Sorbonne, Paris, succeeded even more fully by an application of the theory of undulation.

Light, like sound, is but a form of motion. Both appear to propagate themselves by a wave-like motion similar to the ripples on a pond. A curious property of sound or light waves is that when they meet another wave of equal length coming in an opposite direction the conflicting waves overlap each other, the continuity is broken, and a succession of dark and light, or silent and loud, intervals are produced. A French physician of the beginning of this century, Napoléon Savart, was the discoverer of the phenomenon called interference of sound. If the ear is placed at a short distance off a sounding or echoing plate, and gradually drawn away, it will be observed that the sound alternately dies away and comes back with twofold intensity. The explanation of this is that the waves of sound, the direct and reflex waves, alternately neutralize and re-enforce each other.

Some time ago it occurred to M. Lippmann that if, instead of a continuous wave of light crossing the photographic plate, a broken line (produced by "interference") were sent across it, the silver, instead of being precipitated in one mass throughout the gelatino-bromide, would settle in layers (about the thickness of the soap bubble). By placing a looking-glass behind the plate, the red light, for instance, caused the silver to be deposited in layers of half the thickness of a red wave length. Blue light would cause the layers to be somewhat thicker wherever it passed, but these layers, coinciding exactly as they do with the length of a wave of light, can only let pass the same light which originated them.

This is the principle of M. Lippmann's discovery, and that it will reproduce the colors of the solar spectrum is certain. It has not yet been determined whether it will also reproduce composite hues and delicate shades. At present, the time required for posing will prevent the process from being used to reproduce human likenesses.

Recent Applications of Photography.—The development, improvements, and new applications of photography introduced every year are so numerous as to render a detailed description of each impossible. Of late, what is known as "art photography" has become very popular, the object being to produce photographs that are as little like photographs as possible. Instantaneous photography has also been brought to a remark-

able degree of perfection. In 1890, Mr. Louis Meldon, an English photographer, took a photograph of a bicycle-race in $\frac{1}{500}$ths of a second. In it the spokes of the wheels are distinctly discernible, and the whole picture is in the most perfect focus. Some admirable instantaneous photographs of race-horses have been made, and by them much that is new has been learned of the position assumed by the limbs while in rapid motion. Chemists are continually working to advance photographic art, and a recent discovery is the use of *primuline*, a derivative of coal-tar, as a printing process. By means of it, direct positive printing is done upon such materials as silk, satin, cotton goods, calico, wall-papers, etc. Films made of celluloid are now prepared with a coating of sensitive emulsion. These can be rolled upon a spool, so that one can carry in his pocket with no fear of breakage, material for any number of pictures, thus rendering the photographer independent of glass plates. This rollable film is made use of by Edison in his curious application of photography, the *Kinetograph* (q.v. under PHONOGRAPH), which, by the use of the instantaneous process, does for the eye what the phonograph does for the ear. In the Kinetograph, something like a mile of gelatine film is required.

In 1891, Dr. Nicol, a well-known experimenter, succeeded in simplifying considerably the Calotype process. Formerly the paper was coated with the salts of iron and printed, then developed by flowing over with a solution of nitrate of silver. The improvement consists in combining with the iron salts on the paper the silver salt, and printing in the usual way, for from two to four minutes, then developing the print by immersion in a bath of water and Rochelle salt, to which is added an equal quantity of pulverized borax. The tone will be lighter if less borax is added, and may be varied according to the amount in the developer.

The prints are left in the developer from fifteen to twenty minutes and then washed in water, one gallon, and ammonium, one ounce. They should pass through two separate baths of this kind, followed by a slight rinse in plain water, when they are dried and finished. He says that albumenized paper may be sensitized in the same way.

The paper will keep after being sensitized, and has the advantage of being capable of producing permanent pictures in a quick and easy way.

Photography has become of late of much practical value in many spheres. All the large hospitals have a photographic department, and in the operating room the camera is constantly required to preserve the record of curious and interesting cases. In astronomy (q.v.), the photographic camera has accomplished wonderful results, in revealing objects that are invisible without its aid. A careful study of the negative of the surface of the moon made by the help of the great Lick telescope in 1890–91 has shown the existence of crater mountains, rifts, and streaks hitherto unknown. For instance, near the great crater known as Copernicus, another crater of nearly equal dimensions is shown upon the negatives, although it is absent from the most elaborate maps of the moon and cannot be seen even with the Lick telescope, except when the eye of the camera, instead of the human retina, is applied to look for it. It appears extraordinary that it should escape detection by the telescope when directed to the moon, and yet be visible upon a photograph of the moon. The reason appears to be that the walls of this newly discovered crater were long ago destroyed, being razed by some denuding force nearly to the level of the surrounding surface. It is consequently but the remnant of a great crater ring. Even in that condition, however, it would be visible to the eye, but for the fact that Copernicus, whose walls are still standing to a great height, is surrounded by enormous masses of luminous material, which reflects back the light of the sun with overpowering brilliancy. The glare of this broad reflecting surface is so great as to conceal the comparatively low relief of the broken crater ring.

Retouching.—Many defects in the subject of a photograph are exaggerated by the lens, as, for example, freckles, whose color-value, yellow, in photography appears much darker than to the eye of the beholder in life. In fact, it has been claimed that in the case of a small-pox patient, a photograph taken a day before the appearance of the characteristic rash, showed it in the skin, though at the time when the photograph was taken, it was invisible on the person of the sitter. Again, the vanity of many who sit for their likeness requires that the photographer shall in some way produce a "flattering" result and give a photograph in which wrinkles shall be smoothed away, moles, warts, and blemishes eliminated, and other defects softened or removed. In order to meet this demand, the process known as "retouching" is much employed.

This is described by a well-known authority, Mr. Clarence B. Moore, as follows: "The portions of the negative to be retouched, first with the aid of a little cotton having been covered with a 'retouching' varnish, the retoucher with a lead pencil begins his work. It must be borne in mind that shades as well as positions are reversed upon a negative, white becoming black, and vice versa. Moles, freckles, wrinkles, etc., being dark in color, appear white; and these the pencil of the retoucher darkens to the same tint as the surrounding skin in such a manner that they are entirely merged and disappear. With such defects as appear in black upon the negative and will consequently be reproduced in white upon the print, the retoucher has nothing to do, it being the duty of the 'spotter' later on, with a brush and India ink, to paint them out on the finished photograph. After the retoucher has removed such blemishes or unwelcome traces of the ravages of time as lie in his power, the negative has a mottled look, which is rectified by going carefully over the high lights and giving a smoother appearance to the face."

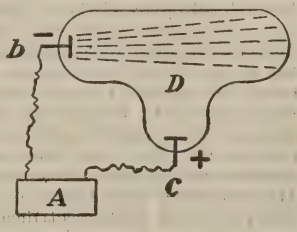
Instantaneous processes are now much in vogue. The *Amateur Photographer* (1890), reproduces a picture taken and handed to the person to be photographed within thirty seconds. In what is known as "pin-hole" work the photograph is taken without a lens. The sensitive plate is exposed to the rays of light passing through an aperture of $\frac{1}{100}$th to $\frac{1}{60}$th of an inch in diameter, with an exposure of from five to ten minutes.

Amateur Photography.—An invention that has done more than all others to popularize photography is what is known as the "dry process," which consists in using gelatine instead of collodion for coating the plates. Besides having the advantage of cheapness, the gelatinized sensitive plates can be bought from the manufacturer, and kept always on hand ready for use, and they do not need to be developed immediately, but can be put away for future convenience. Sheets of celluloid, coated with sensitized emulsion, and known as "transparent films," are now extensively used instead of glass, and although they are more expensive, their lightness of weight makes them peculiarly acceptable to the amateur. The "blue print" process has come into extensive use: paper is prepared with a solution of oxalate of iron, and kept in the dark till used; after exposure in the camera, it should be kept for a few minutes in the light; it is then dipped in a bath containing a solution of red prussiate of potash.

Of late years amateur photography has become very popular, and invention has been stimulated to minimize the difficulty of taking good pictures with little or no experience. The most ingenious photographic apparatus, as well as the most convenient, is that which is known all over the world as the Kodak. The Kodak is an oblong box covered with black morocco, having in one end a lens aperture, on the top a folding key, a cord, and a revolving disk, and on the side a button. When not in use it is enclosed in a neat, hand-sewed, sole leather carrying case with shoulder-strap. One end of the Kodak box contains the lens and shutter mechanism, and the other end the roll-holder for operating the band of sensitive film. When the button at the right is pressed the shutter drops down, allowing the light to pass through the lens. The picture is taken during the brief instant occupied by the opening in the shutter in passing the lens. By pulling the cord at the top the shutter can be set for another exposure; an ingenious device prevents the light from entering the lens while the shutter is being set. The sensitive film is wound on a wood spool, which is removably inserted into the roll-holder, and the end of the film carried over the exposing bed and attached to the reel, which is operated by the key. The film, as it is wound off by the key, turns an indicator, seen through a hole in the top of the Kodak, which shows the operator just how far to turn for each picture; at the same time, the film is automatically marked to show the division line between the pictures. On one spool of film 100 pictures can be taken, and the negatives can then be developed by the operator or by any photographer. Pictures taken by the Kodak vary in size with the size and cost of the apparatus, the largest being about 6 in. by 4 in., and the cost of the apparatus from $25 to $60. In 1891, there were more than 400 associations of amateur photographers in England and the United States. The "Jubilee of Photography" was celebrated in August, 1889, that being the fiftieth anniversary of Daguerre's demonstration of his process.

The Roentgen Photography.—Photography through substances which are opaque to the visible rays of the spectrum has recently been accomplished by means of a newly discovered form of radiation announced by Prof. Roentgen of the University of Wurzburg, in December, 1895. The precise nature of the Roentgen rays is not yet understood, but they possess characteristics different from those of the ultra-violet rays of the spectrum, or of cathode rays. Photographic plates are sensitive to these rays, but instead of the negatives being produced by reflected light from the object photographed in the usual way, the Roentgen rays produce positive impressions on the photographic plate, similar to silhouettes, the object photographed being placed between the source of the rays and the sensitized plate. In this position the parts of the object which are opaque to the Roentgen rays throw a deep shadow upon the plate, while the parts more or less transparent to these rays throw shadows of different intensities, proportional to their transparency. Shadow pictures are thus produced in which the lights and shades impressed upon the photographic plate are of an intensity proportional to the interception, or the transmission of the rays by the various components of the object photographed.

Most, if not all, substances are transparent to these rays, but in very different degrees, and also in proportion to their thickness. A human hand photographed by this process shows every bone clearly outlined, and the surrounding flesh, which is much more transparent to the Roentgen rays than the bones are, shows a comparatively faint shadow. The method employed by Prof. Roentgen to produce this form of radiation is to pass the discharge from a large Rühmkorff coil *A*, through a Crookes or other high vacuum tube *D*, whose electrodes *b* and *c* are connected to the negative and positive poles as shown.



According to Crookes's theory, particles of the attenuated gas are projected from the electrode *b* at a high velocity, which in striking the glass cause it to fluoresce. The streams from the pole *b* are called cathode rays, and if a thin sheet of aluminum is inserted in the glass in front of these rays they will pass through it into the air, which

rapidly absorbs them, and which becomes fluorescent. These cathode rays are deflected from their path by the force of a magnet, and they are absorbed more rapidly by solid bodies than by air. Roentgen has discovered that another form of radiant energy is present when the cathode rays are produced, which possesses some properties distinctly different from the latter. They both produce fluorescence, but the Roentgen rays are not at all deflected by a magnet, and they are neither absorbed by the air nor by many dense substances. Even metals are transparent in some degree to the Roentgen rays.

If the discharge tube *D* is inclosed in a cover of black cardboard and placed in an entirely darkened room, screens of glass, rock-salt, calcium compounds, and many other substances will light up brilliantly at a distance of even six feet from the apparatus. The rays from the tube are entirely invisible to the eye, but act upon a photographic plate. A printed book of 1000 pages placed between the apparatus and the screen is found to be quite transparent to these rays, and the screen also becomes fluorescent when placed behind wood, vulcanized rubber, thin sheet metals, glass, etc. With increased thicknesses of these materials shadows of more or less intensity are thrown upon the screen. These shadows are reproduced upon the photographic plate through the cover of the plate-holder, which is not opened.

These rays cannot be reflected on account of the transparency of all materials to them, and they are not appreciably refracted by passing through prisms or lenses. These properties distinguish these rays from the ultra-violet rays of the spectrum. The centre from which the Roentgen rays appear to radiate in all directions is the place on the wall of the discharge tube, upon which the cathode rays are projected. The relation between these rays and visible light is shown by their chemical activity on a photographic plate, and suggests some kind of ether vibrations as their origin. The evidently longitudinal character of the Roentgen waves has led their discoverer to believe that they may prove to be the longitudinal vibrations of the ether, the exience of which scientists have not yet been able to determine, but which from Helmholtz's theory of light, and from mathematical deductions, should be expected to take place.

Among the properties of Roentgen rays which have been determined recently, is the discharging by them of positively and negatively electrified bodies in air. The more powerful the rays the quicker the discharge. This as well as some other phenomena recorded by Prof. Roentgen was observed by him in a hermetically sealed zinc box provided with a sheet aluminum window through which the rays could pass. The zinc box was made just large enough to contain the observer and the necessary instruments, and one of the walls, behind which the electrical apparatus was placed, was lead covered. These precautions were taken so that the discharge of the electrified bodies would be protected against the electrostatic influences of the vacuum tube, induction coils, etc., as well as from the air in the vicinity of the discharge apparatus outside the box. The intensity of the rays used to discharge electrified bodies was measured by a photographic plate or on a fluorescent screen. It appears to make no difference in respect to their discharge whether the electrified bodies are conductors or insulators. No specific difference has been found in the rate of discharge of different bodies, and similarly no difference has been noticed in regard to the behavior of positive and negative electricity. These experiments tended to show that air traversed by the Roentgen rays also acquired the property of discharging electrified bodies.

Prof. Oliver J. Lodge has made some experiments to verify the statement that the Roentgen rays are not at all affected by a magnet even when the rays are strongly electrified. As experiments on magnetic deflection are liable to disturbance owing to the action of a powerful magnet in displacing the cathode rays in the bulb, and so changing the position of the source of the Roentgen rays, Prof. Lodge made careful experiments on the twisting of the rays traveling along the lines of magnetic force. It is known, for example, that a certain form of Crookes tube is provided with an interior metal cross which will throw a shadow on one end of the glass tube. If such a tube be surrounded by a helix carrying a current, the shadow of the cross will appear considerably twisted, and the twist will be reversed according to the direction of magnetization. This proves that the cathode rays travel spirally along a magnetic field. An analogous experiment upon Roentgen rays showed that they are not susceptible to magnetic influence. The magnet used by Dr. Lodge was a Faraday magnet with perforated pole pieces 5.6 cm. apart, giving a field at the middle of 5,600 C. G. S. lines of force per square centimeter, when excited by 20 storage cells. In the centre of this field a hemisphere of aluminum was placed, and was highly electrified, so as to be on the verge of sparking to one of the pole pieces. On the inside of the hemisphere a couple of parallel copper wires were fastened which the rays passed before entering the electric field, thereby throwing a shadow of them on the sensitive plate. Another piece of wire parallel to the other two was fixed in the passage, outside of either field, close to the plate, and after an exposure to the rays the plate was developed. The shadows of the three wires came out sharply as three parallel lines lying close together. Measurements were taken in successive experiments to note whether the parallelism was preserved with electrification or with the magnetism reversed, but not the least angular twist of the pair of wires with reference to the single wire was shown in any of the experiments.

For six months following the discovery of this form of radiation experiments have

been constantly in progress by the most eminent scientists of the world, to determine the exact nature of the Roentgen rays, but it is worthy of note that Prof. Roentgen's original announcement of his discovery included practically all that we yet know.

Since the introduction of Roentgen photography vacuum tubes have been manufactured in innumerable designs, with a view to obtaining the most powerful source of these rays. In the old-fashioned forms of Crookes tubes the rays proceeded from the fluorescent spots on the glass, where the diffused cathode rays struck upon the walls of the tube from a reflector which was not focussed. With this form of tube the rays proceed from the whole surface of the tube, and in order to cast a sharp shadow on the sensitized plate the tube must consequently be very small. A new form of tube known as a focus tube has been devised for this form of photography which is a much more powerful source of Roentgen rays. These rays appear to emanate from the first surface impinged upon by the cathode rays, whether it be metal or glass, and metal appears to be a more powerful source than glass. Of the different metals platinum seems to be the best for this purpose. This discovery is utilized in the focus tubes, which are made with the cathode pole in the shape of a focussing reflector, which concentrates the cathode rays upon a platinum plate within the tube, which plate then becomes the source from which the Roentgen rays are diffused. These tubes produce pictures far more distinct than those made with the unfocussed tubes. If the tube is connected with an induction coil the discharge through it will be pulsating, but always in the same direction, so that one terminal will always remain the cathode, and only this terminal will need to be focussed. If, however, a condenser and Tesla coil are employed the discharge will be oscillatory, and both terminals will be alternately anode and cathode, and in this case both terminals are focussed on the platinum plate which has no outside connection. Both terminals then become alternately cathodes and project the cathode rays on the plate where the Roentgen rays are generated.

The fluoroscope is an important addition to a Roentgen photographic outfit, by means of which one is able to perceive the shadows of objects without developing them on a photographic plate. This instrument is made in the shape of a hollow truncated pyramid, the smaller end being left open and made to fit over the eyes and face, so as to exclude all light from the interior of the box. The base of the box opposite this opening is a fluorescent screen, which is made of a piece of cardboard coated with a platino-cyanide salt or with calcium tungstate crystals or any material which becomes fluorescent under the action of Roentgen rays. The interior of the box must be light-tight. If an object, such as the hand, for example, be placed between the source of the rays and the fluoroscope, the shadows of the bones will be clearly outlined on the fluorescent screen. In taking Roentgen photographs fluorescent screens are of great advantage in reducing the time necessary for exposure of the plates. This is accomplished by placing the screen against the plate, and is of special importance in surgical work, where an enforced posture for a long time exposure might prove dangerous.

PHOTOM'ETER (Gr. *phōs*, light; *metron*, measure), an instrument for measuring the intensity of light. The first who occupied himself in scientifically determining the intensity of light was Bouguer; but his investigations were far surpassed by those of Lambert, about 1760. The latter indicated an exceedingly simple and effective kind of photometer, which was afterwards constructed by Rumford. The instrument consists of a screen of thin paper placed vertically, and behind it, at the distance of a few inches, is placed a cylindrical stick, or any other similar body. When the intensity of light from two flames is to be compared, they are placed behind this stick in such a way that each casts a separate shadow of the stick upon the paper screen. The observer stands in front of the screen, and directs the removal of the two lights either to or from the stick, till the shadows which are cast upon the screen are equally obscure. The distance of each light from the shadow it casts on the screen is then measured, and the squares of these distances give the relative intensities of the two lights. This photometer may also be modified by employing, instead of a cylindrical stick, a second screen parallel to the first, but of greater thickness, and having an aperture cut in its center. The two lights being then placed behind the second screen, and considerably apart, each casts a separate illumination through the aperture in the second upon the first screen, and the observer in front of the latter changes their relative distances till the illuminations appear to the eye of equal intensity. The calculation is the same as before. There are several other classes of photometers, which, however, do not deserve the name, as they depend upon the heating and chemical powers which generally accompany light, and not upon the intensity of its action on the organs of vision. The Bunsen photometer, which is in most general use, consists of a long box, at one end of which is the standard light, and at the other end is placed the light to be tested. At the center of the box is placed a sheet of paper, so as to separate the two lights, the paper having a spot in the center made translucent with oil or paraffin. The candle-power is found by adjusting the standard light and the one to be measured at such distances from the paper partition that both sides of the spot in the center are equally illuminated, at which point the spot

is nearly invisible. The relative distances of the lights from the paper determine the candle-power with comparison to the standard light. In order to render both sides of the paper visible at once to the observer, two mirrors are mounted obliquely either side of the paper, both of which can be viewed from an aperture in front of the photometer.
